Note

Airborne Infrared Sensor program is a new start for FY 2011.

For all Ballistic Missile Defense System Level Test Schedule information, please refer to the Ballistic Missile Defense System Level Test Schedule.

A. Mission Description and Budget Item Justification

The best way to dissuade, deter, and defeat ballistic missile threats is through integrated ballistic missile defense capabilities--weapons, sensors, and Command and Control, Battle Management and Communications (C2BMC). A potential or actual attack may cross regions and may fly higher and faster than stand-alone, autonomous capabilities operated by a single Military Service can defend against. Integrated BMD capabilities draw on space-, land-, and sea-based assets operated by multiple Services to provide both the best sensor information on the enemy missile's location and track as well as a more diverse and effective set of weapon options for the Combatant Commander to defeat the attack -- all connected by a unifying C2BMC system. As a result, an effort funded in a Program Element may be critical to success of efforts in other Program Elements -- we refer to these connections as ``interdependencies.'' Throughout the budget justification material, we have attempted to highlight interdependencies in order to fully explain the relationship between different parts of the proposed program.

Our submission reflects the greater emphasis on defense of U.S. forces, allies, and friends from regional threats posed by thousands of short- and medium-range ballistic missiles. The most cost-effective missile defense architecture is one that emphasizes intercepts of a threat missile in the early phases of flight. BMDS sensors can observe early intercepts the opportunity to shoot, assess, and shoot again, minimizing the need for costly salvos. Additionally, engaging earlier will serve to mitigate threat countermeasure effectiveness.

As the Department shifts focus to address the looming threat of regional forces in large numbers, we aligned our technology investments with these objectives. Our systems engineering and architecture work uncovered gaps in our ability to 1) address large raid sizes, and 2) intercept the enemy early in his trajectory when the enemy is most vulnerable - assess - then reengage if necessary. We demonstrated the ability of infrared sensors carried aboard Navy Reaper unmanned aerial

systems to observe ballistic missiles in flight at long distance during the ``Stellar Daggers`` test in Hawaii and the Delta II launch in California. The impressive results of these tests lead us to believe airborne sensors can be an effective component of the Ballistic Missile Defense System as early as 2015.

Our technology development effort proves the capabilities needed to achieve early intercepts by conducting a series of ground and flight tests in FY 2010 - 2012, which allow a thorough operational assessment and proof of capability. These demonstrations incrementally prove the key functions of an airborne infrared sensor: acquisition of a threat based on a cue from Overhead Persistent Infrared satellites; tracking of a threat throughout its flight; generation of a 2-dimensional track prediction of the threat`s flight path based on a single airborne sensor; fusing multiple 2-dimensional tracks into a 3-dimensional track with sufficient accuracy to launch an interceptor; and delivering this information through the C2BMC system to the shooter.

The Phased Adaptive Approach (PAA) was developed in response to the rapid proliferation of short and medium range ballistic missiles in Iran and the threat they pose to U.S. Allies and partners, as well as to U.S. deployed personnel and their accompanying families in the Middle East and in Europe. By leveraging recent advances in sensor and interceptor technologies, the United States will aggressively counter this growing regional threat with a more powerful and agile system. The United States is pursuing a four phased approach which will provide a more effective missile defense capability for defense of NATO territories and enhance U.S. homeland defense, it will be complementary of and interoperable with those being developed by NATO, be applicable in other theaters around the world, and will be more adaptable and flexible in order to counter threat advances and provide increased defended areas over time. The initial phase includes the deployment of current and proven missile defense, including the sea-based Aegis Weapons System, the SM-3 interceptor (Block IA), and sensors such as the forward-based Army Navy/Transportable Radar Surveillance system (AN/TPY-2). Subsequent phases will be implemented based on technical maturity, appropriate testing, and threat driven requirements. Airborne Infrared Sensors are planned as a Phase 2 capability for the Phased Adaptive Approach and the associated functionality will be captured in future BMDS Integrated Build documentation when approved.

Note

A. Mission Description and Budget Item Justification

Tracking enemy ballistic missile raids with airborne sensors forward in the theater closes the gap between the enemy's launch and our first track. Depending on the range of the threat, this could increase our battle space by hundreds of seconds and give us the ability to shoot, look, then shoot again. This significantly improves the probability that our Ballistic Missile Defense System will successfully engage the threat and defeat it.

In FY 2010 we took the first steps in exploring this nascent capability. In October, we began assessing platform and sensor alternatives with MIT's Lincoln Laboratory and our partners at the Joint Integrated Air and Missile Defense Organization. This effort will point the way to the vehicle most suited to fill this role among a group of candidates including the currently deployed MQ-9 Reaper and RQ-4 Global Hawk. At the same time, we're engaging with Joint Forces Command and the Combatant Commanders (COCOM) to develop a concept of operations for adding this mission to the Nation's unmanned aerial systems fleet. Armed with the results of the alternatives assessment, we will work with industry, the Combatant Commanders and the services to modify and test the chosen platform and sensor combination.

Meanwhile we're executing an experimental plan that leverages existing platforms and sensors through a series of knowledge points targeted at proving the capability. These knowledge points include proving sensor performance, target auto tracking, raid handling capacity, secure communications and system Quality of Service (QoS) (that is, data of sufficient accuracy and low enough latency) to enable Command and Control, Battle Management and Communications (C2BMC) and BMDS interceptors to complete ballistic missile engagements. Our development and test plan progresses from computer-in-the-loop to hardware-in-the-loop experiments to incrementally verify and validate functionality. These experiments culminate in Aegis intercept flight tests using primarily airborne sensors for fire control at the Pacific Missile Range Facility in Hawaii in the summer of 2012. This testing, interspersed with regular campaigns in theater, lead to an operationally useful architecture as early as 2015.

Goals for Airborne Infrared Sensor program

Develop and test prototypes that integrate with the operational layers of the BMDS to provide precise early missile track information with a sufficient Quality of Service of Command and Control, Battle Management and Communications (C2BMC) and sensor data for engaging theater, regional, and strategic threats.

D. Acquisition Strategy

MDA's fiscal year FY 2010 budget submission reflected an emphasis on early intercept research and development. The acquisition strategy to conduct this technology development effort consists of three focus areas. First, leverage the technical expertise of Federally Funded Research and Development Centers and University Applied Research Centers. Second, continue to leverage relevant existing contracts within the limits of Competition and Contracting Act taking into account contractor past performance, scope, ceiling and period of performance. Third, for new technology initiatives, seek industry solutions via the Advanced Technology Broad Agency Announcement and competitive procurements.

MDA will transition from the existing legacy, project-oriented Systems Engineering and Technical Assistance (SETA) contractor construct to an enterprise-wide Advisory and Assistance Services (A&AS) approach to support the Ballistic Missile Defense System (BMDS) mission. The objectives are to implement national engineering and support services for the BMDS mission across the enterprise, enhance the sharing of ballistic missile defense expertise and knowledge across the agency, centralize the acquisition of support services manpower in a more efficient manner and reduce agency overhead costs enterprise-wide. A&AS support includes engineering and technical services; studies, analyses, and evaluation; and management and professional services.
