<td>This report documents the computer source code used in the US Army Research Laboratory’s [ARL] analysis of meteorological soundings. It complements previous ARL technical reports that describe the algorithms and provide input and output samples. The software produces profiles of meteorological variables for levels and layers as defined by user input height or pressure levels. It can process input profiles from sensing systems such as radiosonde, lidar, or wind profiling radar, and from profiles derived from numerical weather model output such as from the Weather Research and Forecasting model. Some changes to the input routine may be required for different input types and formats.</td>

(ARL OSL): Version 0.4.1, August 2016 13

Approved for public release; distribution is unlimited.
Acknowledgments

I wish to thank Dr Alan Wetmore for his technical assistance in preparing the manuscript.
INTENTIONALLY LEFT BLANK.
1. Introduction

This short document presents the code for the generation of user-defined profiles of meteorological variables. The input profiles or soundings can come from a variety of sources, for example, from Weather Research and Forecasting (WRF) or other model output and World Meteorological Organization (WMO) or other radiosonde soundings. There are 2 main versions or “methods” that produce output in height- or pressure-based profiles of interpolated level and integrated mean layer values. For most forms of input, only the input routine has to be modified, leaving the rest of the program unchanged. However, certain forms of input may require modest changes to one or more other routines. To date, that has been required only once, for use with rawinsonde observation (RAOB) data archived by the National Oceanic and Atmospheric Administration (NOAA). More information on the programs may be found in previous reports.1,2

The several routines are shown here for each of the versions including the one for NOAA-archived RAOBs. A list of the routines required for each version is presented. The flagsound routine or function initializes the relevant arrays with the missing data value flag of −999. The checkdata function can be inserted in the program to check several input, intermediate, or soon-to-be output values before the output is written. The clean_data function provides a gross error check. In addition, a short users’ guide describes how to use the programs once compiled. The other functions are described in the aforementioned references. Most of the routines require the use of the include file convert.h and that, in turn, uses the include file metstruct.h. Since the code is in standard American Standard Code for Information Interchange (ASCII) “C”, it should compile and run on any system supporting that language. To date it has run on various Windows® and Linux® computers.

These source code files are released subject to the ARL Open Source License. A copy of the license is in the Appendix, and a short summary of the license is included in each source code file.
1.1 Extracting the Source Code Files

The source code for each of the routines (called functions in C) are included here. Files common to more than one version are repeated with each version they are used with. The include files convert.h and metstruct.h are used by nearly all the routines.

This document contains links to the embedded, or “attached”, copies of the data files used in preparation of this report. The data files can each be extracted when viewing the electronic version of this document by “right clicking” on one of the icons and selecting the “Save Embedded File to Disk...” menu option.

2. Routines by Version

2.1 Common Include Files

These are the include files used by most of the routines:

- convert.h
- metstruct.h

2.2 Height-Based Output using University of Wyoming RAOBs

The following list contains the files for height-based output using RAOB input from the University of Wyoming website. The executable name is convertwyo. Many of the files appear in other versions without modification.

- convertdatawyo.c
- msgvalues.c
- flagsound.c
- level.c
- layer.c
2.3 Pressure-Based Output using University of Wyoming RAOBs

The following list contains the files for pressure-based output using RAOB input from the University of Wyoming website. The executable name is convertprswyo. Many of the files appear in other versions without modification.
2.4 Height-Based Output using WRF

The following list contains the files for height-based output using profiles generated from WRF output. The executable name is `convertwrf`. Many of the files appear in other versions without modification.
2.5 Pressure-Based Output using WRF

The following list contains the files for pressure-based output using profiles generated from WRF output. The executable name is convertprswrf. Many of the files appear in other versions without modification.

- convertdataprswrf.c
- msgvaluesprs.c
- flagsound.c
- levelprs.c
- layerprs.c
- clean_data.c
- tvfromtemp.c
- readwrf.c
- writeusrmgrp_wrf.c
- writeusrlvlsp_wrf.c
- checkdata.c

2.6 Height-Based Output using NOAA RAOBs

The following list contains the files for height-based output using RAOB input from the NOAA archive website. The executable name is convertnoaa. Many of the files appear in other versions without modification.

- convertdatawyo.c
- msgvaluesnoaa.c

Approved for public release; distribution is unlimited.
The following list contains the files for pressure-based output using RAOB input from the NOAA archive website. The executable name is `convertprsnoaa`. Many of the files appear in other versions without modification.

2.7 Pressure-Based Output using [NOAA RAOB]

The following list contains the files for pressure-based output using RAOB input from the NOAA archive website. The executable name is `convertprsnoaa`. Many of the files appear in other versions without modification.
3. **Brief Users’ Guide**

This brief user’s guide presents the steps to run the programs for generation of height- and pressure-based soundings of level and layer values of meteorological variables. The procedures to run the program are not complex, and past experience suggests that users should be able to run the program easily. Additional information may be found in previous US Army Research Laboratory (ARL) reports including input and output samples.

3.1 **Rawinsonde Observation Input**

The input routine in the current version of the program is designed for RAOBs of the type found at the University of Wyoming web site [http://www.weather.uwyo.edu/](http://www.weather.uwyo.edu/) For RAOBs with a different format than the University of Wyoming, normally only the source code for the input routine must be revised, but no other changes to the program are needed. An exception involves data from the NOAA archive site [http://www.esrl.noaa.gov/raobs/](http://www.esrl.noaa.gov/raobs/). The data are read in nearly the same way, but the split between wind and temperature/humidity (TH) special levels leads to some changes to one other routine. If changes are made, the whole program is then recompiled.

The RAOB input routine for University of Wyoming formatted data has code that can handle certain types of missing data at the beginning and the end of the data section:

1. Stations at heights above the 1,000-hPa level often report the standard levels along with computed heights. Since there are no data below the surface, the
rest of the fields on those lines are blank. The program will run if there are one or more contiguous lines with missing data at the beginning of the data section.

2. At the top of the sounding, sometimes the moisture, the thermal, both thermal and moisture, and/or the wind data are missing. Missing data items in the input are filled with blanks (no missing data indicator). The program will run if one or more contiguous lines with missing thermal or wind data are at the end of the data section. However, it will not handle all possible situations. For many unusual situations the program ends after printing an error message telling the user to check the input.

If the program encounters a wind speed greater than 221 kn before the end of useful wind data, it will end the input at the height immediately below and produce output as if the data ended at the line below the 221-kn speed. To date, this situation has only occurred when the wind fields were missing and other quantities, such as potential temperature that almost always has a value greater than 221 were encountered in the data line.

The RAOB input from the NOAA archive contain the standard levels (e.g., 1,000, 925, and 850 hPa) plus the special levels for wind and for TH. Missing data items are indicated by 99999 where, for example, a special level for TH will omit wind speed and direction and vice versa. Since all fields are filled, the data are read as one set of data lines, including the special levels. The levels with TH and wind data are processed separately in either the msgvaluesnoaa or the msgvaluesprsnoaa routines as appropriate.

3.2  **WRF Input**

The current input routine reads in “soundings” generated from WRF using a Linux script developed by Reen that employs National Center for Atmospheric Research (NCAR) command language (NCL) programs that are available with the WRF software package. To date, all data lines have contained the appropriate values and consequently no special processing is needed as with the RAOB data. If other sources of model data are used, but the data fields and format of the model-generated sounding are the same, then no change is required to the input routine. If the model-derived sounding has a different format or, for example, a different order to the variables in
the data lines, then the input routine would require some modification. In that case, the whole program is recompiled.

The user defines the structure of the output by listing a column of heights or pressures in a text file that ends with \texttt{lvl} (e.g., \texttt{usrprs_lvl}). The input levels define the output levels and the boundaries for the layers. Since the height output normally is above ground level (AGL), the first height usually is 0. Height or pressure must monotonically increase or decrease, respectively (i.e., no repeated values and no following increase of pressure or decrease of height).

### 3.3 Procedure to Run the Height-Based Program

The following are the procedures for running the height-based program:

1. Check the input sounding for normal format. For the RAOB data from the University of Wyoming, if there are spaces instead of data items in the interior of the data section (i.e., not at the beginning or the end), the program may or may not run, but if it does the output sounding(s) will be incorrect. For the WRF-derived soundings or the RAOB soundings from the NOAA archive, check to see if all fields are filled. As noted earlier, missing data in the NOAA format are indicated by 99999, but should not contain blank fields in the data lines. For both RAOB and WRF, check the header for the correct number of fields. A University of Wyoming RAOB must have the words \texttt{Observations at} before the date time group. To date, that has always occurred, but exceptions could happen. Note that the use of the .\ before the executable name may not be needed for some operating systems (see Section 3.5.3).

2. Check that the correct \texttt{lvl} files for the appropriate output soundings are in the same directory as the executable. The current version uses the file \texttt{usrhgt_lvl}.

3. Check the \texttt{input_parameters} file for the correct paths for input and output. This file should be in the same directory as the executable.

4. Do the following depending on the input:

   (a) For RAOBs from the University of Wyoming, type and return the command line 
   
   \texttt{./convertwyo InputFileName}

   
   
   Approved for public release; distribution is unlimited.
(e.g., ./convertwyo_RAOB_ABC_20140520 (\)).

(b) For RAOBs from the NOAA archive, type and return the command line
./convertnoaa InputFileName (\).
(e.g., ./convertnoaa_RAOB_XYZ_20140520 (\)).

(c) For WRF-generated soundings in the format produced by the extraction script,^3 type and return the command line
./convertwrf InputFileName (\),
(e.g., ./convertwrf_WRF_ABC_20140520 (\)).

3.4 Procedure to Run the Pressure-Based Program

The following are the procedures for running the pressure-based program:

1. Check the input sounding for normal format as in Section 3.3 for the height-based program.

2. Check that the correct lvls files for the appropriate output soundings are in the same directory as the executable. The current version uses the file usrprs_lvls.

3. Check the input_parameters file for the correct paths for input and output. This file should be in the same directory as the executable.

4. Do the following depending on the input:

   (a) For RAOBs from the University of Wyoming, type and return the command line . ./converprstwyo InputFileName (\),
   (e.g., ./converprstwyo_RAOB_ABC_20140520 (\)).

   (b) For RAOBs from the NOAA archive, type and return the command line
   ./convertprsnoaa InputFileName (\).
   (e.g., ./convertprsnoaa_RAOB_XYZ_20140520 (\)).

   (c) For WRF-generated soundings in the format produced by the extraction script,^3 type and return the command line
   ./convertprswrf InputFileName (\),
   (e.g., ./convertprswrf_WRF_ABC_20140520 (\)).
3.5 Notes

3.5.1 lvls Files

The files ending in _lvls provide the level and layer structure information for the program. If 1, ..., \( n - 1 \) lvls files out of \( n \) such files are not in the same directory, then the program skips that (those) part (parts) of the calculations, and if no lvls files exist at all, then the program quits without crashing after printing an error message.

3.5.2 input_parameters Files

The input_parameters file is required. It contains the input and output directories. Though they may be the same or different, a line for each is needed. Without that file, the program quits after printing an error message. If there is only one line, the program runs without producing output.

3.5.3 A Note for Windows Systems

To run in a Windows command prompt window, type the executable name without the preceding ./ followed by the input filename (e.g., convertwyo_RAOB_ABC_20140520)

4. Conclusion

This report presents the source code used in the analysis of vertical profiles of meteorological variables. The programs may be used to interpolate vertical profiles at user-defined height or pressure levels and compute integrated mean values for layers defined by the aforementioned height or pressure levels. The input may come from observation systems such as radiosondes, lidars, and radar wind profilers as well as from profiles generated from numerical weather model output such as from the WRF model.

These programs have evolved over time to account for new types of input as well as upgrades to, for example, produce additional types of output profiles. It is expected that this process will continue, including upgrades suggested by users of the software. The data files used for the report are embedded in the electronic version and may be extracted using the links in Section 2.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

“License” shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 10 of this document.

“Licensor” shall mean the project originator or entity authorized by the project originator that is granting the License.

“Legal Entity” shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, “control” means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

“You” (or “Your”) shall mean an individual or Legal Entity exercising permissions granted by this License.

“Source” form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

“Object” form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

“Work” shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a notice that is included in or attached to the work (an example is provided in the Appendix below).

“Derivative Works” shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

“Contribution” shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative
Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the author or by an individual or Legal Entity authorized to submit on behalf of the author. For the purposes of this definition, “submitted” means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the author as “Not a Contribution.”

“Contributor” shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, where copyright exists, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in
Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a “NOTICE” text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an “AS IS” BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

10. All or part of this work is in the public domain and not subject to copyright. If any part of this work is deemed copyrightable, now or in the future, its
Contributors agree that such copyrightable parts may be distributed under the terms of this License.
