TITLE: Investigating clinical benefits of a novel sleep-focused mind-body program on Gulf War Illness (GWI) symptoms: An exploratory randomized controlled trial

PRINCIPAL INVESTIGATOR: Yoshio Nakamura, Ph.D.

CONTRACTING ORGANIZATION: University of Utah
Salt Lake City, UT 84112-9023

REPORT DATE: July 2013

TYPE OF REPORT: Annual

PREPARED FOR: U.S. Army Medical Research and Materiel Command
Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for Public Release;
Distribution Unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.
Subjects are being recruited for the proposed study and the study is still ongoing. There is no finding to report from the study as of 30/06/2013.

Introduction

The purpose of this study is to conduct an exploratory randomized controlled trial designed to evaluate clinical benefits of a novel mind-body intervention program for primary care management of Gulf War Veterans with sleep disturbance and unrelieved GWI symptoms. The main objective of the study is to evaluate and compare the clinical benefit of two sleep-focused therapeutic interventions: Mind-Body Bridging (MBB) and Supportive Education (SED) on sleep and co-morbid Gulf War related symptoms. MBB consists of cognitive and attentional (experiential) techniques for cultivating present-focused, non-judgmental awareness of one’s body, emotions, and thoughts. We will recruit 72 Gulf War veterans, who first will undergo a comprehensive screening assessment and then will be assigned to one of the two programs (MBB or SED). Each Veteran will receive a total of 6 hours of treatment, in 2-hour sessions once a week over 3 consecutive weeks. Each Veteran will be evaluated again after treatment has ended. Three months after treatment ends, Veterans will complete follow-up questionnaires. These assessments will help us to evaluate both the efficacy of the intervention programs and any differences in individual treatment response. Additionally, the project will explore underlying mechanisms of action involved in treatment benefits resulting from MBB and SED.
by using a biomarker of stress as a proxy indicator of intermediate mechanisms activated by
MBB and SED.

Body
Progress reported in this Annual Report (please see below) is consistent with Milestone 2
specified in SOW during Year 2, but we clearly recognize that the project is behind the original
schedule. As suggested by the program officer, we will request no-cost extension of the project
to complete recruiting the targeted number of Gulf War Veterans (at least 60) for the project.
With respect to Milestone 2 specified in SOW, we have continued to recruit Gulf War 1 Veterans
who have self-reported sleep disturbance and conduct screening sessions. During Year 2 period,
eligible veterans who completed screening were assigned to the intervention groups and they
also completed pre- and post-intervention assessments as well as 3-month follow-up assessment.
We are continuing our recruiting and screening effort and we will run two groups (one group for
MBB and one group for control) in August 2013.

Key Research Accomplishments (as of June 30, 2013)

- 40 Veterans consented to participated in the study
- 29 Veterans completed intervention sessions
- 28 Veterans completed post-intervention evaluation
- 14 Veterans completed 3 month follow-up evaluation

Reportable Outcomes

Study enrollment is still currently ongoing and we do not have any result yet to report
here.

Conclusion

As we will continue to recruit eligible GW Veterans into the ongoing study during Year 3
period, we are optimistic that we will be able to recruit enough GW Veterans into our study. We
anticipate that we will request no-cost extension of the project at least 2 months before the end of
the project period (Dec. 31, 2013). Given this, we are currently not in a position to reach any
conclusion regarding study aims and hypothesized benefits of the experimental intervention
program (MBB) at the end of Year 2.
