AWARD NUMBER: W81XWH-14-1-0598

TITLE: Use of a Portable Stimulator to Treat GWI

PRINCIPAL INVESTIGATOR: Jorge M. Serrador, PhD

CONTRACTING ORGANIZATION: Veterans Biomedical Research Institute
East Orange, NJ 07018

REPORT DATE: October 2016

TYPE OF REPORT: Annual

PREPARED FOR: U.S. Army Medical Research and Materiel Command
Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for Public Release;
Distribution Unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.
The purpose of this research is to characterize vestibular function in a population of veterans with Gulf War Illness and determine if subsensory electrical stimulation can improve vestibular function. To date, we have collected vestibular screening data on nine subjects, with four scheduled to return for visits using electrical stimulation. Since we have preliminary data only and have not completed subject visits using electrical stimulation, we are unable to report any significant finding during this research period.

1. INTRODUCTION

Gulf War Veterans have a significantly greater incidence of reporting dizziness, suggesting vestibular involvement. Gulf War Veterans with Gulf War Illness (GWI) demonstrate impaired balance, specifically during conditions which rely on vestibular inputs, suggesting vestibular impairment in ~50% of this population. In this study, we will determine the level of vestibular dysfunction within Veterans with GWI and apply the novel method of stochastic noise, shown to improve neural signals, to enhance vestibular function and balance in those with vestibular impairments. To treat Veterans diagnosed with GWI that have vestibular (balance) dysfunction we will use a portable stochastic noise electrical stimulator that provides low levels of stimulation which is imperceptible to enhance vestibular and balance function.

2. KEYWORDS

Vestibular, Gulf War Illness

3. ACCOMPLISHMENTS

MAJOR GOALS OF THE PROJECT

Major Goal 1 – Characterize vestibular dysfunction in Veterans with Gulf War Illness

Subtask 1: Establish Project Management System/Develop Logistical Plan (Sept- Dec 2014)
  a. Train the current members of the team (research assistant) on vestibular screenings, balance assessments, galvanic stimulation (completed)

Milestone #1: Establish project management system, hire and train research staff (Planned Completion Dec 2014) – 100% complete

Subtask 2: Regulatory Review and Approval Process (Sept - Dec 2014)
  a. Finalize IRB paperwork including application, protocol and consent form (completed)
  b. Submit any revisions requested by the regulatory board prior to approval (completed)
  c. Obtain DoD HRPO approval (completed)

Milestone #2: Regulatory review and approval obtained (Planned completion Dec 2014) -100% complete

  a. Develop plan to meet recruitment goals (completed)
  b. Mail IRB approved recruitment letters to Veterans seen at the WRIISC; follow up with phone calls
     • ~150 Gulf War Veterans evaluated at the WRIISC– 25 letters per week will be mailed to this subset followed by a phone call
     (We have attempted to contact 267 Veterans. Of the 176 veterans that have been
contacted by phone to participate in the study, 110 were interested in participating and screened for the study and 51 are eligible for study visits.

c. Distribute flyers to all VA facilities and their ambulatory services including community-based outpatient clinics to publicize the study.

d. Contact Veteran Service Organizations for support on best way to perform outreach (having monthly meetings with VSO representatives that are Gulf War Veterans to discuss recruitment goals) (completed)

Milestone #3: Recruitment Plan Executed (Planned Completion June 2015) -85% complete

Subtask 4: Determine the prevalence of vestibular impairment in GWI veterans (Aim 1) & Determine the effectiveness of subsensory electrical stimulation in a population of Veterans with vestibular dysfunction to improve balance function (Aim 2) (Dec 2014- June 2016)

a. Screen subjects/ collect data: total of 140 subjects
   • 3 subjects per week/ 3 study visits
   • Vestibular testing, balance assessments

(35 subjects have been enrolled in the study)

Data analysis (Post-doctoral fellow/research assistant will continually analyze data as collected)

Aim 1:
-31 subjects have had their data analyzed
-Analysis shows 13 of 26 GWI subjects have otolith hypofunction (50%),
-Analysis shows 1 of 5 GW control subjects have otolith hypofunction (20%)

Aim 2:
-Of 31 subjects analyzed, 22 subjects are eligible to return for sub-sensory electrical stimulation in Aim 2 (71%) (both GWI and GW Control)
-18 of 22 subjects have completed study visits for Aim 2
-14 of 18 subjects have had their data analyzed, 4 are in process
-6 of 14 (43%) show improvement in OCR with electrical stimulation, including 5 of 12 (42%) GWI

Present/publish work

Milestone #4: Enrolled and tested subjects (Planned Completion March 2016) – 43% Completion

Milestone #5: Data analysis completed (Planned Completion April 2016) – 12% Completion

Milestone #6: Data presented/published (Planned Completion June 2016) –5% Completion (Talk given at 29th Barany Society meeting in Seoul, Korea, 2016 titled “Gulf War Illness in US Veterans is Associated with Otolith Hypofunction and Decreased Brain Blood Flow”)

ACCOMPLISHMENTS DURING THIS ANNUAL PERIOD
Major Activities

- Continued enrollment of study subjects
- Continued enrollment of controlled subjects with normal vestibular function to ensure that the stimulator does not have negative effects.
- Data analysis of enrolled subjects performed
- Continuing to bring subjects in for stimulation testing

Milestone #4: Enrolled and tested subjects (Planned Completion March 2016) – 43% Completion

Specific Objectives for Year 2

1) Continued execution of recruitment plan to screen subjects for enrollment
2) Continued enrollment and data collection
3) Analysis of data from enrolled subjects
4) Re-visit recruitment plans to further develop outreach events at VA NJ

Significant Results of Year 2

1) Phone calls have been made to 112 veterans within this past year resulting 51 phone screens to assess subject study eligibility.
2) Twenty-seven subjects contacted within this past year were eligible for initial study visit. Twenty-four subjects have been enrolled within this past year for a total of 35 subjects for the study.
3) Overall, 31 subject data has been analyzed with 22 eligible to return for sub-sensory electrical stimulation in Aim 2.

Major Findings, Developments, Conclusions, and Other Achievements

- We have three major findings to report so far:
  1) Veterans with Gulf War Illness show reduced ocular torsion indicative of otolith hypofunction
  2) Use of Stochastic Noise to stimulate the vestibular system did not produce a significant improvement in ocular torsion, unlike what we have seen in civilians and other veterans
  3) Despite a lack of improvement in ocular torsion, there was a significant improvement in balance, demonstrated by reduced mediolateral sway, however we didn’t see the same effect in the anterior posterior sway.
Vestibular Hypofunction in Veterans with Gulf War Illness

To determine if Veterans with Gulf War Illness have vestibular hypofunction we examined a group of GWI Veterans and found that they had significantly lower than an age and gender matched group of healthy civilians that Dr. Serrador had collected as part of a previous NASA research grant (Serrador et al, Neurosci Lett. 2009 Nov 6;465(1):10-5). The figure to the right shows the distribution of ocular torsion, a vestibular ocular reflex that is directly attributable to otolith function in both Veterans with GWI and healthy civilians. One can see that while there is a large distribution, the Veterans with GWI definitely have a distribution on the lower range and are showing significantly lower values than healthy individuals. This suggests that GWI is associated with otolith hypofunction. It remains unclear why this is occurring but the data suggest this is definitely the case.

Effect of Stochastic Noise Stimulation on Otolith Function

To determine if we could use subthreshold electrical noise to enhance vestibular function, we used the same low level electrical noise we had used previously in other veterans, and assessed whether this stimulation could increase ocular torsion. The figure to the right demonstrates that while it was able to improve ocular torsion in some veterans (~50%) it did not have a significant effect on ocular torsion in this group. This was quite surprising since we had previously found in veterans without GWI, that we were able to improve ocular torsion in ~90% of the participants. It remains unclear why we did not see the same level of improvement in the GWI group that we say in other veterans. We are currently trying to examine if GW era veterans without GWI show improvement similar to what we say in other veterans. Further work is needed to determine why the stimulus was not as effective in this group.
Effect of Stochastic Noise Stimulation on Static Balance Function

Our original hypothesis was that by improving vestibular function, i.e. ocular torsion, we would then also improve balance control. However, our finding that stochastic noise did not consistently improve ocular torsion made us skeptical that we would see a balance improvement. However, to our surprise, mediolateral sway while standing on an unstable surface consistently showed reduced sway during stimulation compared to sham. Interestingly there was not a similar improvement in anterior posterior sway. However, this finding was not unexpected since previous galvanic vestibular stimulation has shown that placement of electrodes over mastoid process results in greater affects on mediolateral sway. Thus our current electrode placement would most likely improve mediolateral sway. It is also interesting that the improvement occurred when veterans were standing on an unstable surface with eyes open. We did not see the improvement with eyes closed. We were expecting a greater improvement with eyes closed since when participants lack vision they must rely more heavily on the vestibular system. One possible explanation on why this didn’t occur is that the increased vestibular inputs needed to be integrated with another sensory system such as vision to confirm their validity. Since we were only turning the stimulator on for brief periods the vestibular nuclei within the brain did not have sufficient time to adapt to the increased vestibular information. However, with the addition of visual information, there was improved sensory integration and thus improved balance.

These data suggest that the stimulator is able to improve balance even in those that do not show improvements in ocular torsion. It remains unclear if that because vestibular function is still improvement but we are unable to detect using ocular torsion or another mechanism is involved. Another important finding is that if the reason we see the improvement with eyes open is because increased vestibular inputs must be integrated, we would expect that longer term stimulator use would allow for better integration of the improved vestibular info centrally, and thus possibly even greater improvements in balance.
What opportunities for training and professional development has the project provided?

This project has provided training for all research staff to be competent at vestibular screenings, balance assessments, and electronic stimulation procedures. The staff have been able to travel to Dr. Schubert’s clinic at Johns Hopkins to be trained on most up to date vestibular testing techniques.

How were the results disseminated to communities of interest?

- Nothing to Report

What do you plan to do during the next reporting period to accomplish the goals?

1) Continued execution of recruitment plan to screen subjects for enrollment
2) Data collection and analysis from enrolled subjects
3) Re-visit recruitment plans to further develop outreach events at VA NJ

4. IMPACT

What was the impact on the development of the principal discipline(s) of the project?

- Nothing to Report

What was the impact on other disciplines?

- Nothing to Report

What was the impact on technology transfer?

- Nothing to Report

What was the impact on society beyond science and technology?

- Nothing to Report

5. CHANGES/PROBLEMS

- Nothing to Report
Changes in approach and reasons for change

- Nothing to Report

Actual or anticipated problems or delays and actions or plans to resolve them

- Recruitment has been slower than expected, we have recruited 26 Veterans with GWI and 5 Veterans without GWI and we have 3 veterans with GWI currently scheduled to complete screening visit. We provided information to several veteran service organizations (Veterans of Foreign Wars, American Legion, Disabled American Veterans, National Gulf War Resource Center) about the research to recruit Veterans both locally and nationally. A majority of our recruitment efforts have been focused on a local population but we have increased our research efforts on a national to increase awareness and aid in our recruitment. We are currently working with Jim Bunker of the National Gulf War Resource Center to post an ad on the website that will highlight the study and the fact that travel funds are available to allow Veterans from anywhere in the nation to participate. We believe this will greatly increase the recruitment. When we had Mr. Bunker post a survey for to be completed by Gulf War Veterans in 2011, we had over 800 responses with 72 hours. We posted an advertisement to the VANJ Facebook page.

- We are still seeing a higher than expected rate of vestibular hypofunction within our population. After assessing 31 veterans with Gulf War Illness we see 50% with hypofunction. At our current rate, we would need to recruit 84 subjects to get to our desired 42 completed subjects. This will reduce the number required to screen and should assist in allowing us to complete the work as required.

- We obtained a no cost extension to allow us to recruit further veterans and complete our specific aims.

Changes that had a significant impact on expenditures

- There were no changes in expenditures.

Significant changes in use or care of human subjects, vertebrate animals, biohazards, and/or select agents:

Significant changes in use or care of human subjects

- No changes to use of care of human subjects to report

Significant changes in use or care of vertebrate animals.
- No animal use research will be performed to complete the Statement of Work

Significant changes in use of biohazards and/or select agents

- No biohazards and/or select agents will be used to complete the Statement of Work

6. PRODUCTS

Publications, conference papers, and presentations

Journal publications.

- Nothing to Report

Books or other non-periodical, one-time publications

7. PARTICIPANTS & OTHER COLLABORATING ORGANIZATIONS

What individuals have worked on the project?

Name: Jorge Serrador, PhD
Project Role: PI
Nearest person month worked: 2.5
Contribution to Project: no change

Name: Bishoy Samy, MS
Project Role: Research Engineer
Nearest person month worked: 1
Contribution to Project: no change

Name: Tien Le, BEng
Project Role: Research Assistant
Nearest person month worked: 1
Contribution to Project: Has stopped work on project and taken new position

Name: Leslie De La Cruz, BS
Project Role: Research Assistant
Nearest person month worked: 3
Contribution to Project: Leslie has performed phone screens and recruitment of veterans including enrollment and data collection

Has there been a change in the active other support of the PD/PI(s) or senior/key personnel since the last reporting period?

- Nothing to Report

What other organizations were involved as partners?

1. Organization Name: University of Western Sydney- Paul Breen, PhD
Location of Organization: Australia
Partner’s contribution to the project:
- Financial support – Nothing to report
- In-kind support – Dr. Breen’s salary is covered by UWS as detailed in original proposal.
- Facilities – Nothing to report
- Collaboration – Designed a novel low power stochastic noise stimulator that will be used to improve vestibular function in our patients
- Personnel exchanges – Nothing to report
- Other – Nothing to report
2. Organization Name: Azusa Pacific University – Scott Wood, PhD
Location of Organization: California
Partner’s contribution to the project:
- Financial support – Nothing to report
- In-kind support – Nothing to report
- Facilities – Nothing to report
- Collaboration – Provided expertise in scientific protocol development & vestibular assessment
- Personnel exchanges – Nothing to report
- Other – Nothing to report

2. Organization Name: Johns Hopkins University – Michael Schubert, PhD
Location of Organization: Maryland
Partner’s contribution to the project:
- Financial support – Nothing to report
- In-kind support – Nothing to report
- Facilities – Nothing to report
- Collaboration – Provided expertise in scientific protocol development & vestibular assessment
- Personnel exchanges – Nothing to report
- Other – Nothing to report

8. SPECIAL REPORTING REQUIREMENTS

- None

QUAD CHARTS: If applicable, the Quad Chart (available on https://www.usamraa.army.mil) should be updated and submitted with attachments.

9. APPENDICES: None.
Use of a Portable Stimulator to Treat Gulf War Illness
Innovative Treatment Evaluation Award
Funding Opportunity Number: W81XWH-14-1-0598

PI: Jorge M. Serrador, PhD
Org: Veterans Biomedical Research Institute
Award Amount: $553,095

Problem and Military Relevance
- Gulf War Veterans have a significantly greater incidence of reporting dizziness, suggesting vestibular involvement
- Gulf War Veterans with GWI demonstrate impaired balance, specifically during conditions which rely on vestibular inputs, suggesting vestibular impairment in ~50% of our sample
- We will determine the level of vestibular dysfunction and apply the novel method of stochastic noise, shown to improve neural signals, to enhance vestibular function and balance in those with vestibular impairments

Proposed Solution
To treat Veterans diagnosed with GWI that have vestibular (balance) dysfunction we will use a portable stochastic noise electrical stimulator that provides low levels of stimulation which is imperceptible to enhance vestibular and balance function.

Goals/Milestones

**CY14 Goal – Project Planning and Approval**
- Establish Project Management System/Develop Logistical Plan
- Obtain Regulatory Review and Approval

**CY14/15 Goals – Execute recruitment plan**
- Develop and execute plan to meet recruitment goals

**CY15/16 Goals – Recruit Subjects & Perform Galvanic Stimulation**
- Screen 140 subjects using vestibular and balance testing to characterize the vestibular impairments of Veteran with GWI
- Use of stochastic electrical stimulation in 42 GWI Veterans with vestibular impairments
- Analyze collected data and evaluate effectiveness of sub-sensory galvanic stimulation
