In this application, we propose to address this problem by focusing primarily on a single post-chemotherapy complaint in a single cancer: problems with memory in patients with ovarian cancer. We focus on this problem for three reasons: 1) according to the Ovarian Cancer National Alliance, memory problems are among the most frequently cited by patients; 2) by narrowly targeting our inquiry, we will avoid the “noise” in the data associated with different treatment regimens and correspondingly different cognitive complaints and; 3) there are decades of neuroscience research, some of it from our group, indicating that memory impairment, such as the kind reported in the context of chemotherapy, is mediated primarily by a region of the brain called the hippocampus. In this application, we propose to investigate the possibility that standard chemotherapy regimen used to treat ovarian cancer leads to memory impairment because it arrests the normal processes of neurogenesis, the growth of new nerve cells, in this brain region. In addition, because a growing body of research studies shows that physical exercise leads to improvement in memory and learning and that exercise targets the same brain regions responsible for chemotherapy-induced memory problems, we propose to conduct a pilot study of an intervention to increase patients’ physical activity to test whether this will slow this effect of chemotherapy on nerve cell growth in the hippocampus and subsequently offset memory decline.

1 INTRODUCTION:

In this application, we propose to address this problem by focusing primarily on a single post-chemotherapy complaint in a single cancer: problems with memory in patients with ovarian cancer. We focus on this problem for three reasons: 1) according to the Ovarian Cancer National Alliance, memory problems are among the most frequently cited by patients; 2) by narrowly targeting our inquiry, we will avoid the “noise” in the data associated with different treatment regimens and correspondingly different cognitive complaints and; 3) there are decades of neuroscience research, some of it from our group, indicating that memory impairment, such as the kind reported in the context of chemotherapy, is mediated primarily by a region of the brain called the hippocampus. In this application, we propose to investigate the possibility that standard chemotherapy regimen used to treat ovarian cancer leads to memory impairment because it arrests the normal processes of neurogenesis, the growth of new nerve cells, in this brain region. In addition, because a growing body of research studies shows that physical exercise leads to improvement in memory and learning and that exercise targets the same brain regions responsible for chemotherapy-induced memory problems, we propose to conduct a pilot study of an intervention to increase patients’ physical activity to test whether this will slow this effect of chemotherapy on nerve cell growth in the hippocampus and subsequently offset memory decline.

2 KEYWORDS:
Physical activity interventions, ovarian cancer treatment, chemotherapy-induced cognitive dysfunction

3 ACCOMPLISHMENTS:

Major Goals/Objectives:
1. Approval by CUMC Herbert Irving Comprehensive Cancer Center (HICCC) Protocol Review and Monitoring Committee
   Date of Completion: 4/17/14 (100% completed)
   1A. Approval of HICCC protocol materials by DoD HRPO; Respond to DoD HRPO questions
      100% completed
2. Approval by New York State Psychiatric Institute (NYSPI) Institutional Review Board
   Date of Completion: 5/15/15 (100% completed)
   2A. Approval of NYSPI IRB materials by DoD HRPO; Respond to DoD HRPO questions
      Date of Completion: June 1, 2015 (100% completed)
3. Training research assistant “coach” in patient recruitment, retention, delivery of walking intervention
   Date of Completion: July 1, 2015 (100% completed)
4. Training research assistant in administration and scoring of neuropsychology tests
   Date of Completion: July 1, 2015 (100% completed)
5. Training research assistant in image analysis
   Date of Completion: July 1, 2015 (100% completed)
6. Recruiting 21 ovarian cancer patients 4-6 weeks post-surgery
   July 31, 2016: 5% completed
7. Pre- and post-intervention neuropsychology and imaging data collection and scoring
   July 31, 2016: 5% completed
8. Delivering the interventions to the two treatment groups
What was accomplished under these goals?
This is a study to assess the feasibility of recruiting ovarian cancer patients in a pilot study to assess the impact of increasing physical activity on neuropsychological and brain imaging outcomes. The principle finding to date is that due to changing treatment protocols, it is extremely difficult to recruit patients into the study. To date, we have screened 883 post-operative patients and have recruited only 1. With the exception of 4 patients, all others failed to meet inclusion/exclusion criteria. Of the 4 who met criteria, only one agreed to participate.

What opportunities for training and professional development has the project provided?
Nothing to report

How were the results disseminated to communities of interest?
Nothing to report

What do you plan to do during the next reporting period to accomplish the goals?
We have expanded our potential pool of patients to those with endometrial and uterine cancers in the hope that we will be able to recruit more patients.

IMPACT:

What was the impact on the development of the principal discipline(s) of the project?
Nothing to report

What was the impact on other disciplines?
Nothing to report

What was the impact on technology transfer?
Nothing to report

What was the impact on society beyond science and technology?
Nothing to report

CHANGES/PROBLEMS:

Changes in approach and reasons for change
To increase recruitment, we have opened enrollment to endometrial and uterine cancer patients.

Actual or anticipated problems or delays and actions or plans to resolve them
As this is a feasibility study, we have encountered significant problems with recruitment, due in large part to changes in treatment protocols.

Changes that had a significant impact on expenditures
Nothing to report

Significant changes in use or care of human subjects, vertebrate animals, biohazards, and/or select agents
IRB approval to recruit endometrial and uterine cancer patients: January 16, 2016
IRB approval to recruit patients receiving both chemotherapy and radiotherapy: May 27, 2016

Significant changes in use or care of human subjects
IRB approval to recruit endometrial and uterine cancer patients: January 16, 2016
IRB approval to recruit patients receiving both chemotherapy and radiotherapy: May 27, 2016
Significant changes in use or care of vertebrate animals.
Nothing to report

Significant changes in use of biohazards and/or select agents
Nothing to report

Has there been a change in the active other support of the PD/PI(s) or senior/key personnel since the last reporting period?
Yes, other support attached.

What other organizations were involved as partners?
Nothing to report

SPECIAL REPORTING REQUIREMENTS:
n/a

APPENDICIES
n/a
**Richard Sloan**

Dr. Sloan has an appointment at the New York State Psychiatric Institute/Research Foundation for Mental Hygiene and Columbia University. This is detailed in a Dual Appointment Agreement between the entities and precludes the possibility of NYSPI/NFMH supporting effort supported by Columbia University and vice versa. Therefore, each project listed below indicates effort at each institution and also Total Professional Effort (TPE) encompassing the multiple appointments.

NIH TPE 0.49 CM

Does abdominal fat modify the effect of exercise on bone remodeling?

This proposal aims to establish, in a controlled study, to what extent exercise determines bone turnover based on serum markers. This marker data is required to plan biopsy studies to investigate effects of exercise on re-modeling at the tissue level. We hypothesize that low level of physical activity is an important and modifiable contributor to the low bone formation phenotype of abdominal obesity in premenopausal women. We further hypothesize that increased exercise will ameliorate the bone formation defect and, ultimately, the bone quality defect found specifically in states of abdominal obesity.

Role: Co-Investigator

NIH TPE 0.49 CM

Breaking up prolonged sitting: a factorial trial to evaluate the efficacy of multiple components of a sitting interruption intervention for improving physical activity levels. This study is designed to investigate the effects of a sitting interruption intervention in real world conditions over an extended period.

Role: Co-Investigator

NIH (Kimhy) 4/1/2017 - 3/31/2021 0.30 CM
NIH TPE 0.24 CM

Individuals with schizophrenia (SZ) display substantial cognitive deficits across multiple domains. These deficits have been identified as major determinants of poor functioning and disability, representing a serious public health concern and an important target for interventions. At present, available pharmacological and cognitive-remediation treatments offer only minimal to limited benefits to ameliorate these deficits. Thus, there remains an urgent need to identify novel treatments for cognitive deficits in people with SZ.

Exercise, Age-Related Memory Decline, and Hippocampal Function
The goal of this proposal is to conduct a randomized controlled trial of the effects of aerobic training on cognitive decline and to investigate the role of the hippocampus in mediating this effect.

Human induced neuronal stem cell models of familial Alzheimer’s disease
To determine the mechanism for altered endosomal trafficking in Familial Presenilin mutant Alzheimer’s disease models.

Hippocampal and Cognitive Function, Exercise and Ovarian Cancer: A Pilot Study
In this application, we propose to investigate the possibility that standard chemotherapy regimen used to treat ovarian cancer leads to memory impairment because it arrests the normal processes of neurogenesis, the growth of new nerve cells, in this brain region.

Targeting retromer dysfunction: a convergent mechanism in familial and sporadic PD
The overarching goals of the present proposal are A.) To further detail mechanisms by which LRRK2 and other PD-related genes regulate vesicular trafficking in cells, and identify potential therapeutic targets and B.) To develop in vitro and in vivo models and tools, including drug-like reagents, for further studies regarding potential therapeutic targets such as VPS35.

In vivo validation of the retromer complex as a key component of Alzheimer’s disease etiology
Establish a link between retromer dysfunction and tau toxicity.

Longitudinal Imaging of Patients at Clinical Risk for Psychosis
In this proposal we will use a variant of functional brain imaging that can detect disease-associated dysfunction in small regions of the brain and apply this to patients at clinical risk for psychosis who are followed prospectively for clinical and brain imaging outcomes. The main project goal is to definitively test the hypothesis of hippocampal hyperfunction as a pathogenic driver in schizophrenia and related disorders.
