IDENTIFICATION
A. Title: Write Change Tape (SWRTOUT), Ident K35 Mod AE
B. Programmed: R. C. Wise, System Development Corporation
   1 February 1963
C. Documented: R. C. Wise, System Development Corporation
   15 February 1963

PURPOSE
SWRTOUT produces a tape for later use by the program SMERGE. The tape
contains messages input to SWRTOUT and operated upon by SWRTOUT.
SWRTOUT accepts individual or grouped messages from a user program and
collects like messages until a block of these messages is built. It
then adds a checksum and writes the messages on a magnetic tape.

USAGE
A. Calling Sequence
   L RTJ SWRTOUT
       N B
   L+1 ERROR RETURN
   L+2 NORMAL RETURN
Where: "N" is the number of words in buffer starting at location "B".

B. Parameters
   "N" is the number of words to be accepted by SWRTOUT. "N" occupies
   bits 15 to 23 of location L. If "N" is zero, SWRTOUT will terminate
   operation by calling SMERGE.

   "B" is the starting location of the first message SWRTOUT is to
   accept. "B" occupies bits 0 to 14 of location L.

C. On-line Messages
   SWRTOUT has two messages, both are printed on the on-line 1612.
1. PLEASE MOUNT WRITE TAPE FOR SWRTOUT ON TAPE 18, AND HIT START.
2. UNRECOVERABLE ERROR IN SWRTOUT - MOUNT NEW TAPE 18 AND REINITIATE PREVIOUS FUNCTION .

Message 1 occurs the first time SWRTOUT is entered.

Message 2 occurs if there is persistent write parity or write length error, the change tape is too short, or a commanding message cannot be verified.

D. Tape Assignments
SWRTOUT uses tape 18 - unit 1, cabinet 2, channel 5/6 for the change tape.

E. Input Formats
The individual messages are described in Reference A.

Grouped messages must have each individual message begin left justified in the 1604 word. Only like messages (i.e., same message code) may be grouped.

F. Output
The Change Tape

The Change tape is an intermediate tape produced by SWRTOUT for the use of SMERGE.

It is a single file tape, each record is a message block. Message blocks concerning a given Vehicle, Station, Revolution are separated by a header record specifying the Vehicle, Station and Revolution. Maximum record size is 512 words.
CHANGE TAPE FORMAT

Header \( V_1 R_j S_k \)

BLOCK A \( (V_1 R_j S_k) \)

BLOCK B (""")

BLOCK C (""")

Header \( V_1 R_m S_n \)

BLOCK B \( (V_1 R_m S_n) \)

Header \( V_o R S_{p q} \)

BLOCK A \( (V_o R S_{p q}) \)

BLOCK B (""")

BLOCK A (""")

EOF

G. Error Return

The error return in the SWRTOUT calling sequence is not presently used, but must be present as SWRTOUT returns to L+2 for a normal return.

When an unrecoverable error occurs, SWRTOUT informs the operator of the error and halts. No restart is possible - the previous function must be reinitiated.

OPERATING DESCRIPTION

SWRTOUT is entered by the user program with an RTJ instruction followed by two parameters; the "B" parameter specifying the location of the input message block and the "N" parameter specifying the number of words in the message block \((1 \leq N \leq 511)\).
SWRTOUT will make the following checks.

1. If buffer is empty, transfer input to buffer.
2. If buffer is not empty
   a. If message type input is same as buffer type
      1) If the number of words input plus the number of words
         in buffer is greater than 511 words, write the buffer
         and transfer the input to the buffer.
      2) Transfer the input to buffer
   b. Write the buffer and transfer the input to the buffer.

If SWRTOUT writes the buffer on the Change Tape, a complement checksum
of the buffer will be added to the record written. If a block consists
of commanding messages, SWRTOUT will reread the record and verify the
block, using a word-by-word comparison of a one word input buffer and
the original message.

If the conditions for writing the output buffer are not met, SWRTOUT
will immediately return to the user program after transferring the
message block to its own output buffer.

Upon receipt of the "end of input" flag, SWRTOUT will empty its buffer,
write an end of file, and transfer to SMERGE via the COPII successor
call. The Change Tape will be rewound.

All error recoveries will be attempted four times before an error
message is given.

RESTRICTIONS
A. SWRTOUT uses tape 18, unit 3, cabinet 2, channel 5/6
B. Interrupt is locked out by SWRTOUT.
C. Only one type of message may be in a message block.

D. Messages must start left justified in a 1604 word and must be an integral number of 1604 words.

E. An index register cannot be used in specifying the starting location of a message block.

F. Header messages must precede sets of message blocks.

G. SWRTOUT has a time dependent processing loop and should not be stopped.

H. SWRTOUT uses TAPE, PRINT1612, CALL.

TIMING

The timing of SWRTOUT is dependent upon the volume of data to be written on the change tape.

VALIDATION TESTS

SWRTOUT was validated by using a driver (Reference C) to input messages of varying types and lengths. These messages were written on the Change tape and the Change tape was sorted by SMERGE and a new Transfer tape was produced. The Transfer tape was dumped and the dump checked for the desired result.
