THREE-DIMENSIONAL THERMOELASTIC PROBLEMS OF PLANES
OF DISCONTINUITIES OR CRACKS IN SOLIDS

by
M. K. Kassir 2 and G. C. Sih 3

Abstract

Presented in this paper is a general formulation of the three-dimensional thermoelastic equations (uncoupled) for problems involving crack-like imperfections or planes of discontinuities of some kind in solids. Harmonic functions are constructed from which the stresses and displacements may be obtained. The thermoelastic potential for symmetric distribution of temperatures on the crack surfaces is related to Boussinesq's three-dimensional logarithmic potential for a disk in the shape of the crack. The mass density of the disk is found to be proportional to the prescribed temperature gradient normal to the crack plane. As an application of the theory, closed form solutions, in terms of complete and incomplete elliptic integrals of the first and second kind are given for a flat elliptical crack whose surfaces are exposed to uniform temperatures and/or temperature gradients. The possibility of extending the Griffith-Irwin theory of fracture to cracks in thermal environments is also discussed.

1 The results presented in this paper were obtained in the course of research carried out under Contract Nonr 610(06) with the Office of Naval Research, United States Navy. This paper will be published in the Proceedings of the Third Southeastern Conference on Theoretical and Applied Mechanics.

**Introduction**

While the solution of problems of thermal stress for thin plates and long cylinders has received considerable attention in the past\(^4\), comparatively little work has been done on the problems of three-dimensional theory of thermoelasticity for solids containing imperfections. It is known that when a temperature field is disturbed by the presence of cracks or flaws, there is high elevation of the local temperature gradient accompanied by thermal stress. Thermal disturbances of this kind in some cases cause crack propagation resulting in serious damage of structural members. Hence, solutions to thermoelastic problems of cracks have immediate practical value in fracture mechanics.

The existing literature on the three-dimensional aspects of thermal stress around cracks has been limited to a few publications. Moreover, an extensive reference of papers on thermoelasticity may be found in [1,2].
previous works are confined to axially symmetric problems dealing with the "penny-shaped" crack. Such a restriction is mainly due to the mathematical difficulties of this class of problems. By the method of dual integral equations in the Hankel transforms, Olesiak and Sneddon [3] investigated the distribution of thermal stress in the neighborhood of a penny-shaped crack in an infinite medium. The prescribed temperatures on the upper surface of the crack are identical with those on the lower surface. Using the condition of symmetry with respect to the crack plane, they reduced the problem to one of mixed boundary conditions on the surface of a semi-infinite solid. The same problem was also treated by Deutsch [4]. The case when the thermal conditions are applied skew-symmetrically to the crack surfaces was considered by Florence and Goodier [5]. The present paper deals with a class of thermoelastic problems with cracks of more general shapes which include the circular cracks in [3-5] as special cases. It should be pointed out that the effects of both inertia and coupling between temperature and strain fields are neglected in the aforementioned works.

An effective way of solving three-dimensional boundary-value problems is to construct the general solution in terms of certain arbitrary functions dictated, in part, by the appropriate field equations and, in part, by the topology of the region of interest. These arbitrary functions are then determined such that the boundary conditions of the problem are fulfilled. This is precisely the approach adopted in the work to follow. With the aid of harmonic functions, a general solution of Navier's equation including thermal effects is obtained. By restricting the analysis to problems with cracks, stress and displacement expressions are derived for two types of problems, one of which concerns with stress systems which are symmetrical about the crack plane and the other with skew-
symmetrical systems. In the former case, the steady-state temperature field for an arbitrary region of exposure (or region of the crack) may be determined from the Newtonian potential for a disk in the form of the crack plane. For the purpose of illustration, detailed solutions in ellipsoidal coordinates are obtained for the problem of heat applied to the surfaces of an "elliptically-shaped" crack.

Since the practical aspect of this paper is to establish a criterion of fracture for cracks in thermally stressed bodies, an examination of the stress field in the vicinity of the crack border is pertinent. The local stresses are found to have the same functional relationship and inverse square-root singularity as those obtained in isothermal elastic bodies subjected to surface tractions [6]. The significance of this result is that the Griffith-Irwin theory of fracture [7], originally developed for bodies maintained at constant temperatures, may now be extended to predict the onset of rapid crack propagation caused by thermal changes. More specifically, stress-intensity factors \( k_j (j=1,2,3) \), which govern the stability behavior of cracks, are computed and shown in curves for the cases of thermal conditions applied symmetrically and skew-symmetrically to the faces of an elliptical crack.

**Fundamental Equations of Thermoelasticity**

When the influences of both coupling and inertia are disregarded, the general thermal-stress problem separates into two distinct problems to be solved consecutively. The first is a problem in the theory of steady-state heat conduction which requires the temperatures \( T(x,y,z) \) at every point of the body to satisfy the Laplace equation in three-dimensions:

\[
\nabla^2 T(x,y,z) = 0 .
\]
Once the temperature distribution has been found, the resulting displacements and stresses may be obtained, respectively, from the Navier's displacement equation of static equilibrium

$$\frac{1}{1-2\nu} \nabla \cdot \mathbf{u} + \nabla^2 \mathbf{u} = 2(1+\nu)(1-\nu)\alpha \nabla T.$$  \hfill (2)

and the Duhamel-Neumann stress-displacement relation

$$\sigma = \mu \left[ \nabla \mathbf{u} + \nabla^2 \mathbf{u} + \frac{2}{1-2\nu} \left[ \mathbf{u} \nabla \cdot \mathbf{u} - (1+\nu)\alpha \nabla T \right] - \mathbf{I} \right].$$  \hfill (3)

in which \( \mathbf{u} \) is the displacement vector, \( \sigma \) is the stress tensor and \( \mathbf{I} \) is the isotropic tensor. The gradient and Laplacian operators are denoted by \( \nabla \) and \( \nabla^2 \), while \( \mu, \nu, \) and \( \alpha \) designate the shear modulus, Poisson's ratio, and the coefficient of linear expansion of the solid whose mechanical and thermal properties are assumed to be isotropic and homogeneous.

If \( x, y, z \) stand for the Cartesian coordinates, the solution of eq. (2) for three-dimensional problems with geometric discontinuities on the plane \( z = 0 \) takes the form

$$\mathbf{u} = \phi + z \psi^*, \quad \psi^* = \psi^{**} + \psi.$$  \hfill (4)

where

$$\nu \nabla \phi = 0, \quad \nabla^2 \psi^* = 0, \quad \frac{3 \psi}{\partial z} = \frac{1}{2(1-\nu)}\alpha T.$$  \hfill (5)

and the vector displacement potential \( \phi \) has components \( \phi_x, \phi_y, \) and \( \phi_z \).

In eq. (4), \( \psi^{**} \) is the scalar displacement potential and \( \psi \) the thermoelastic potential. Hence, the dilatation becomes

$$\nabla \cdot \mathbf{u} = \nabla \cdot \phi + \frac{\partial \psi^*}{\partial z}.$$  \hfill (6)

and the condition of equilibrium, eq. (2), requires that
\[ v \cdot \psi + \frac{3}{8} \left[ (3-4\nu)\psi^{**} - \psi \right] = 0. \] (7)

For \( T(x,y,z) = 0 \), the above expressions reduce to those given in [6].

Using eqs. (3), (4) and (6), the components of the stress tensor \( \sigma \), in terms of \( \phi \) and \( \psi^* \), may be obtained:

\[ \frac{\sigma_{zz}}{2\mu} = \frac{3}{8z} (\phi_z + \psi^*_z) + \frac{\nu}{1-2\nu} (v \cdot \phi + \frac{3\psi^*_z}{2z}) - 2(\frac{1-\nu}{1-2\nu}) \frac{\partial \psi^*_z}{\partial z} + z \frac{\partial^2 \psi^*_z}{\partial z^2} \] (8a)

\[ \frac{\tau_{xz}}{\mu} = \frac{3}{8} (\phi_z + \psi^*_z) + \frac{3\phi_z}{8z} + 2z \frac{\partial^2 \psi^*_z}{\partial x \partial z} \] (8b)

\[ \frac{\tau_{yz}}{\mu} = \frac{3}{8y} (\phi_z + \psi^*_z) + \frac{3\phi_y}{8z} + 2z \frac{\partial^2 \psi^*_z}{\partial y \partial z} \] (8c)

For the purpose of discussing symmetry conditions in the section to follow, the other stress components \( \sigma_{xx}, \sigma_{yy}, \tau_{xy} \) are not of immediate interest.

**Thermoelastic Problems with Planes of Discontinuities**

In order to avoid unnecessary complication in the analysis, the surfaces of the plane of discontinuity or crack at \( z = 0^* \) are taken to be free from applied normal and shear stresses, since the method of solution when there are such applied stresses has already been treated in [6,8]. Moreover, the complete stress solution can be split up into two parts, which may be considered independently. The first part deals with the application of surface temperatures that are the same on both sides of the crack and the second considers the case where the temperatures on the upper surface, \( z = 0^+ \), of the crack are equal and opposite to those on the lower surface, \( z = 0^- \). The corresponding stress systems will be referred to as the symmetrical part and skew-symmetrical part, respectively.

In the symmetrical part of the problem, the stresses and displacements, induced by thermal changes, will depend upon the variable \( z \) as follows:
These functions are required to be continuous outside the crack region on the plane \( z = 0 \) and the odd ones shown in eq. (9b) must be zero on such a plane. Furthermore, if the crack surfaces are free from applied stress, then \( \sigma_{zz} = 0 \). In view of symmetry, the condition \( \tau_{xz} = \tau_{yz} = 0 \) must hold everywhere on the plane \( z = 0 \). Hence, eqs. (8b) and (8c) give

\[
\frac{\partial}{\partial x} (\phi_z + \psi^*) + \frac{\partial \phi_x}{\partial z} = 0, \quad z = 0.
\]  

(10a)

\[
\frac{\partial}{\partial y} (\phi_z + \psi^*) + \frac{\partial \phi_y}{\partial z} = 0, \quad z = 0.
\]  

(10b)

At this point, it is convenient to introduce a harmonic function \( f(x,y,z) \) such that both eqs. (7) and (10) are satisfied, i.e., by letting

\[
\phi_x = (1-2v) \frac{\partial f}{\partial x} + \int_{z}^{\infty} \frac{\partial \psi}{\partial x} \, dz.
\]  

(11a)

\[
\phi_y = (1-2v) \frac{\partial f}{\partial y} + \int_{z}^{\infty} \frac{\partial \psi}{\partial y} \, dz.
\]  

(11b)

\[
\phi_z = -2(1-v) \frac{\partial f}{\partial z}, \quad \psi^* = \frac{\partial f}{\partial z}.
\]  

(11c)

where

\[
v^2 f(x,y,z) = 0.
\]

The limits of the integrals in eqs. (11a) and (11b) have been chosen to satisfy the condition of regularity of the displacement at infinity. It follows that the displacements and stresses in the solid may be expressed in terms of two real harmonic functions \( f(x,y,z) \) and \( \psi(x,y,z) \). They are
\[ u = (1-2\nu) \frac{\partial f}{\partial x} + \int_{-\infty}^{\infty} \frac{\partial \psi}{\partial x} \, dz + z \frac{\partial F}{\partial x} \, . \]  
\hspace{1cm} (12a) 

\[ v = (1-2\nu) \frac{\partial f}{\partial y} + \int_{-\infty}^{\infty} \frac{\partial \psi}{\partial y} \, dz + z \frac{\partial F}{\partial y} \, . \]  
\hspace{1cm} (12b) 

\[ w = -2(1-\nu) \frac{\partial f}{\partial z} + z \frac{\partial F}{\partial z} \, . \]  
\hspace{1cm} (12c) 

\[ \frac{\sigma_{xx}}{2u} = \frac{\partial^2 f}{\partial x^2} + 2\nu \frac{\partial^2 f}{\partial y^2} + \int_{-\infty}^{\infty} \frac{\partial^2 \psi}{\partial x^2} \, dz - 2 \frac{\partial \psi}{\partial z} + z \frac{\partial^2 F}{\partial x^2} \, . \]  
\hspace{1cm} (13a) 

\[ \frac{\sigma_{yy}}{2u} = \frac{\partial^2 f}{\partial y^2} + 2\nu \frac{\partial^2 f}{\partial x^2} + \int_{-\infty}^{\infty} \frac{\partial^2 \psi}{\partial y^2} \, dz - 2 \frac{\partial \psi}{\partial z} + z \frac{\partial^2 F}{\partial y^2} \, . \]  
\hspace{1cm} (13b) 

\[ \frac{\sigma_{zz}}{2u} = -\frac{\partial F}{\partial z} + z \frac{\partial^2 F}{\partial z^2} \, . \]  
\hspace{1cm} (13c) 

\[ \frac{\tau_{xy}}{2u} = (1-2\nu) \frac{\partial^2 f}{\partial x \partial y} + \int_{-\infty}^{\infty} \frac{\partial^2 \psi}{\partial x \partial y} \, dz + z \frac{\partial^2 F}{\partial x \partial y} \, . \]  
\hspace{1cm} (13d) 

\[ \frac{\tau_{xz}}{2u} = z \frac{\partial^2 F}{\partial x \partial z} \, . \]  
\hspace{1cm} (13e) 

\[ \frac{\tau_{yz}}{2u} = z \frac{\partial^2 F}{\partial y \partial z} \, . \]  
\hspace{1cm} (13f) 

in which 

\[ F = \frac{\partial f}{\partial z} + \psi \, . \]  

Similarly, the skew-symmetrical part of the problem may be formulated 

by having 

\[ u, v, \sigma_{xx}, \sigma_{yy}, \sigma_{zz} \quad ; \text{odd in } z \]  
\hspace{1cm} (14a) 

\[ w, \tau_{xz}, \tau_{yz} \quad ; \text{even in } z \]  
\hspace{1cm} (14b) 

to be continuous across the plane \( z = 0 \) with the exception of the crack.
region. The odd quantities in eq. (14a) must again vanish on the plane of continuity. On the crack surfaces, \( \tau_{xz} = \tau_{yz} = 0 \). Note that in the case of skew-symmetry \( \sigma_{zz} = 0 \) on the entire plane of \( z = 0 \), i.e.,

\[
\frac{3}{(1-v)z} \left( \frac{\partial \psi}{\partial z} + \frac{\partial \phi_z}{\partial z} \right) + v \left( \frac{\partial \phi_x}{\partial x} + \frac{\partial \phi_y}{\partial y} \right) = \frac{3\psi}{(1-v)z}. \tag{15}
\]

Eliminating the function \( \psi \) by means of eqs. (7) and (15) yields

\[
\frac{1}{(1-v)} \left( \frac{\partial \phi_x}{\partial x} + \frac{\partial \phi_y}{\partial y} \right) + 2 \frac{\partial \phi_z}{\partial z} = 0. \tag{16}
\]

Now, let \( g(x,y,z) \) and \( h(x,y,z) \) be two harmonic functions related to \( \phi_x \) and \( \phi_y \) by

\[
\phi_x = -2(1-v) \frac{\partial g}{\partial x}, \quad \phi_y = -2(1-v) \frac{\partial h}{\partial y}. \tag{17}
\]

where

\[
v^2 g(x,y,z) = 0, \quad v^2 h(x,y,z) = 0.
\]

It follows that

\[
\psi** = \psi - (1-2v) \psi. \tag{18}
\]

and

\[
\phi_z = \psi - (1-2v) \psi**. \tag{19}
\]

In a straightforward manner, the displacements are found as

\[
u = -2(1-v) \frac{\partial g}{\partial z} + z \frac{\partial h}{\partial x}. \tag{20a}
\]

\[
v = -2(1-v) \frac{\partial h}{\partial z} + z \frac{\partial g}{\partial y}. \tag{20b}
\]

\[
w = -2(1-v) \left[ \frac{\partial g}{\partial x} + \frac{\partial h}{\partial y} \right] + G + z \frac{\partial G}{\partial z}. \tag{20c}
\]

- 10 -
and the stresses are

\[ \sigma_{xx} = \frac{2(1-v)}{2\mu} \frac{\partial^2 h}{\partial y^2} - 2 \frac{\partial G}{\partial z} + z \frac{\partial^2 G}{\partial x^2} \]  
(21a)

\[ \sigma_{yy} = \frac{2(1-v)}{2\mu} \frac{\partial^2 g}{\partial x^2} - 2 \frac{\partial G}{\partial z} + z \frac{\partial^2 G}{\partial y^2} \]  
(21b)

\[ \sigma_{zz} = z \frac{\partial^2 G}{\partial z^2} \]  
(21c)

\[ \tau_{xy} = -(1-v) \frac{\partial}{\partial y} \left( \frac{\partial g}{\partial y} + \frac{\partial h}{\partial x} \right) + \frac{\partial G}{\partial x} + z \frac{\partial^2 G}{\partial x^2} \]  
(21d)

\[ \tau_{yz} = (1-v) \frac{\partial}{\partial x} \left( \frac{\partial h}{\partial x} - \frac{\partial g}{\partial y} \right) + \frac{\partial G}{\partial y} + z \frac{\partial^2 G}{\partial y^2} \]  
(21e)

\[ \tau_{xz} = (1-v) \frac{\partial}{\partial x} \frac{\partial G}{\partial y} + \frac{\partial G}{\partial z} + z \frac{\partial^2 G}{\partial x \partial y} \]  
(21f)

where

\[ G = \frac{\partial g}{\partial x} + \frac{\partial h}{\partial y} + \psi \]  
(22)

The above formulation places no restriction on the geometry of the planes of discontinuities. However, for the sake of definiteness, the subsequent work will be concerned with a plane crack in the shape of an ellipse.

**Temperature Distribution in an Infinite Solid**

Consider the problem of an infinite solid the interior of which is exposed to uniform temperatures over a region occupied by the ellipse

\[ \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 , \quad z = 0 \]  

Hence, it is expedient to solve this problem in ellipsoidal coordinates \((\xi, \eta, \zeta)\), which are related to the rectangular coordinates \((x,y,z)\) of any
point by [9]

\[ a^2(a^2-b^2)x^2 = (a^2+\xi) \ (a^2+n) \ (a^2+\zeta) \ . \tag{23a} \]
\[ b^2(b^2-a^2)y^2 = (b^2+\xi) \ (b^2+n) \ (b^2+\zeta) \ . \tag{23b} \]
\[ a^2b^2z^2 = \xi_n \zeta \ . \tag{23c} \]

where

\[ -b^2 > \xi > 0 > \eta > -a^2 \ . \]

In the plane \( z = 0 \), the inside of the ellipse is given by \( \xi = 0 \), and the outside by \( \eta = 0 \).

Let the temperature distribution \( T(x,y,z) \) in the solid to be an even function of \( z \) vanishing at infinity. The boundary conditions of interest are

\[ T = -T_0 \ , \ \ \xi = 0 \ . \tag{24a} \]
\[ \frac{\partial T}{\partial z} = 0 \ , \ \ \eta = 0 \ . \tag{24b} \]

where \( T_0 \) is a constant. The solution of this problem is well known since the temperature \( T(x,y,z) \) is equivalent to the velocity potential of a perfect fluid passing through an elliptic aperture of a rigid partition\(^5\).

Thus, it can easily be shown that

\[ T(x,y,z) = -\frac{aT_0}{2K(k)} \int_{\xi}^{\infty} \frac{ds}{\sqrt{Q(s)}} = -T_0 \frac{u}{K(k)} \ . \tag{25} \]

\(^5\)See, for example, [9], p. 150, eq. (1).
Here, \( K(k) \) is the complete elliptical integral of the first kind with argument \( k^2 = 1 - \frac{(b/a)^2}{1 - (b/a)^2} \) and

\[
Q(s) = s(a^2 + s)(b^2 + s).
\]

The variable \( u \) is associated with the Jacobian elliptic functions \( snu, \ cnu, -\), and should not be confused with the \( x \)-component of the displacement vector \( u \). The relationship between \( u \) and the ellipsoidal coordinate \( \xi \) is

\[
\xi = a^2 \left( \frac{cn u}{sn u} \right)^2 = a^2 \left( \frac{sn^2 u - 1}{u} \right).
\]

From eq. (25), the temperature gradient may be computed:

\[
\frac{\partial T}{\partial z} = \frac{T_0}{bK(k)} \cdot \frac{\eta \xi (a^2 + \xi)(b^2 + \xi)}{(\xi - \eta)(\xi - \xi)}^{1/2}.
\]

On the plane \( z = 0 \), eqs. (25) and (26) provide the correct boundary conditions as

\[
T = \begin{cases} 
-T_0, & \xi = 0 \\
\frac{\partial T}{\partial z} = \frac{T_0}{bK(k)} (1 - \frac{x^2}{a^2} - \frac{y^2}{b^2})^{-1/2}, & \xi = 0 \\
-1, & K = 0 \\
0, & n = 0.
\end{cases}
\]

Substituting eq. (25) into the third expression in eq. (5) gives

\[
\frac{\partial \psi}{\partial z} = -\frac{(1 + \psi)}{1 - \psi} \frac{a\xi T_0}{4K(k)} \int_{-1}^{\infty} \frac{ds}{\sqrt{Q(s)}}.
\]

The explicit expression of \( \psi(x, y, z) \) is not required for this part of the problem. Terms containing the derivatives of \( \psi(x, y, z) \), such as those in eqs. (12) and (13), will be found subsequently.
If the elliptical region of exposure is maintained at a uniform temperature gradient $Q_0$, then the temperature $T(x,y,z)$ is an odd function of $z$. The boundary conditions are

$$\frac{\partial T}{\partial z} = -Q_0 , \quad \xi = 0 . \quad (28a)$$

$$T = 0 , \quad \eta = 0 . \quad (28b)$$

Aside from a multiplying constant, $T(x,y,z)$ is identical with the velocity potential for axial flow past an elliptic disk in an infinite fluid\textsuperscript{6}. From this hydrodynamical analogy, it is found that

$$T(x,y,z) = \frac{ab^2Q_0}{2E(k)} \cdot z \int_0^{\infty} \frac{ds}{s\sqrt{Q(s)}} = \frac{Q_0}{E(k)} \left[ \frac{snu}{cn u} - E(u) \right] . \quad (29)$$

where

$$E(u) = \int_0^u \frac{dn}{t}$$

and $E(k)$ is the complete elliptical integral of the second kind. Using eqs. (28) and (5), the thermoelastic potential can be determined from the conditions

$$\frac{\partial^2 \psi}{\partial z^2} = -\left( \frac{1+\nu}{1-\nu} \right) \frac{Q_0}{2} , \quad \xi = 0 .$$

$$\frac{\partial \psi}{\partial z} = 0 , \quad \eta = 0 .$$

which can be written in the equivalent form

\textsuperscript{6}See [9], p. 144, eq. (8).
\[ \psi = H(x, y) \quad \xi = 0 \, . \]

\[ \frac{\partial^2 \psi}{\partial z^2} = 0, \quad \eta = 0 \, . \]

The function \( H(x, y) \) may be considered to be any particular solution of the equation

\[ \frac{\partial^2 H}{\partial x^2} + \frac{\partial^2 H}{\partial y^2} = (\frac{1+\nu}{1-\nu}) \frac{aQ_0}{2} \, . \]

Furthermore, if \( H(x, y) \) is sufficiently smooth, a suitable solution for the thermoelastic potential may be taken in the form of the Newtonian potential of a simple layer with a continuously differentiable density. Without going into details, it can be verified that putting

\[ \psi(x, y, z) = \left( \frac{1+\nu}{1-\nu} \right) \frac{ab^2aQ_0}{8E(k)} \int_{\xi}^{\infty} \left[ \frac{x^2}{a^2+s} + \frac{y^2}{b^2+s} + \frac{z^2}{s} - 1 \right] \frac{ds}{\sqrt{Q(s)}} \, . \]  

(30)

into \( \alpha T = 2(\frac{1-\nu}{1+\nu}) \frac{\partial \psi}{\partial z} \) results in eq. (29).

Having obtained the thermoelastic potentials given by eqs. (27) and (30), a more detailed treatment of the thermoelastic problem is in order.

The Elliptical Crack Problem

Let the surfaces of a flat elliptical crack in an infinite solid be opened by the application of uniform temperature \( T_0 \) and temperature gradient \( Q_0 \) as described in the previous section. In the absence of mechanical and thermal disturbances at sufficiently large distances away from the crack, the displacements and stresses are assumed to vanish as \( z \) approaches infinity. From the knowledge of \( \psi(x, y, z) \) or its derivative with respect to \( z \), the complete solution of the present problem requires the evaluation of one function \( f(x, y, z) \) for the symmetric part and two functions \( g(x, y, z) \) and \( h(x, y, z) \) for the skew-symmetric part.
Suppose that the prescribed temperature are constant across the upper surface of the elliptical crack and are exactly the same as those across the lower surface given by eqs. (24). In addition, the corresponding mechanical conditions are
\[ \sigma_{zz} = 0, \ \xi = 0; \ \eta = 0. \]

Thus, eqs. (12c) and (13c) give
\[
\begin{align*}
\frac{\partial^2 f}{\partial z^2} &= 0, \ \xi = 0 \quad \text{(31a)} \\
\frac{\partial f}{\partial z} &= 0, \ \eta = 0 \quad \text{(31b)}
\end{align*}
\]
An appropriate form of the function \( f(x,y,z) \) is [6]
\[
f(x,y,z) = \frac{1}{2} A \left( \frac{x^2}{a^2 + s} + \frac{y^2}{b^2 + s} + \frac{z^2}{s} - 1 \right) \frac{ds}{\sqrt{Q(s)}}.
\]
which satisfies eq. (31a) and the constant \( A \) is obtained from eq. (31b) given by
\[
A = (\frac{1 + \nu}{1 - \nu}) \cdot \frac{\alpha b^2 T_0}{4E(k)}.
\]
To find the displacements \( u \) and \( v \), it is necessary to evaluate
\[
\frac{\partial^2 \psi}{\partial x \partial z} = (\frac{1 + \nu}{1 - \nu}) \cdot \frac{\alpha a T_0}{8K(k)} \cdot \frac{x}{h^2(a^2 + \xi)} \sqrt{Q(\xi)}.
\]

obtained from eq. (27). Here,
\[
h^2 = \frac{(\xi - \eta)(\xi - \zeta)}{4Q(\xi)}.
\]
Upon integration with respect to the variable \( z \) yields
\[
\frac{\partial \psi}{\partial x} = (\frac{1 + \nu}{1 - \nu}) \cdot \frac{\alpha a T_0}{8K(k)} \int_{z}^{\infty} \frac{x}{h^2(a^2 + \xi)} \sqrt{Q(\xi)} \ ds.
\]
where the variable of integration may be changed from $z$ to $\xi$ by the relation [9]

$$\frac{dz}{h^2} = \frac{2\xi}{z} d\xi.$$ 

Introducing $s$ as a dummy variable of integration, eq. (34) becomes

$$\frac{a}{s} = -(\frac{1+v}{1-v}) \cdot \frac{a \alpha T_0}{4K(k)} \cdot x \int_0^\infty \frac{s}{\xi (a^2+s)} z(s) \sqrt{Q(s)} \, ds \, .$$

where $z(s)$ is determined from

$$\frac{x^2}{a^2+s} + \frac{y^2}{b^2+s} + \frac{z^2}{s} - 1 = 0 \ .$$ \hspace{1cm} (35)

Integrating eq. (34) once more gives

$$\int_0^\infty \frac{\alpha \psi}{z} \, dz = -(\frac{1+v}{1-v}) \cdot \frac{a \alpha T_0}{4K(k)} \cdot x \int_0^\infty \left[ \int_0^\infty J(s;x,y) \, ds \right] \, dz \ .$$ \hspace{1cm} (36)

in which

$$J(s;x,y) = \frac{(1 - \frac{x^2}{a^2+s} - \frac{y^2}{b^2+s})^{-1/2}}{(a^2+s)^{3/2}} \frac{(a^2+s)^{1/2}}{(b^2+s)} \ .$$

Since integrals of the form

$$\int_0^\infty dz \int_0^\infty \lambda(s) \, ds \ ,$$

may be evaluated from the formula

$$\int_0^\infty dz \int_0^\infty \lambda(s) \, ds = \int_0^\infty [z - z(s)] \lambda(s) \, ds \ .$$ \hspace{1cm} (37)
eq. (36) takes the form\(^7\)

\[
\int_0^\infty \frac{\partial \psi}{\partial z} \, dz = \left( \frac{1+\nu}{1-\nu} \right) \cdot \frac{a_0 T_0}{4K(k)} \cdot x \left[ I_1 - I_2 \right].
\]  

(39a)

where

\[
I_1 = \int_\xi^\infty (a^2+s)^{-3/2} \left( b^2+s \right)^{-1/2} \left[ 1 - \frac{x^2}{a^2+s} - \frac{y^2}{b^2+s} \right]^{-1/2} \, ds.
\]

\[
I_2 = \int_\xi^\infty s^{1/2} (a^2+s)^{-3/2} \left( b^2+s \right)^{-1/2} \, ds.
\]

In a similar manner, it can be shown that

\[
\int_0^\infty \frac{\partial \psi}{\partial y} \, dz = \left( \frac{1+\nu}{1-\nu} \right) \cdot \frac{a_0 T_0}{4K(k)} \cdot y \left[ I_3 - I_4 \right].
\]  

(39b)

where

\[
I_3 = \int_\xi^\infty (a^2+s)^{-1/2} \left( b^2+s \right)^{-3/2} \left[ 1 - \frac{x^2}{a^2+s} - \frac{y^2}{b^2+s} \right]^{-1/2} \, ds.
\]

\[
I_4 = \int_\xi^\infty s^{1/2} (a^2+s)^{-1/2} \left( b^2+s \right)^{-3/2} \, ds.
\]

The displacements in the plane \( z = 0 \) are found as\(^8\)

\[\text{See Appendix (1) for the results of integrals.}\]

\[\text{evaluation of eq. (39a) is intimately related to the elliptical punch problem which was solved only in part by Green and Sneddon [8]. Their solution can be completed by following the steps going from eq. (27) to (39). Incidentally, a complete solution to the elliptical punch problem has been given by Galin [11].}\]

\[\text{See Appendix (1) for the results of integrals.}\]
\[
u = - \frac{2A}{abk^2} \cdot x \left\{ (1-2\nu) \left( \frac{b}{a} \right)^2 \left[ u - E(u) \right] + \frac{E(k)}{K(k)} \left[ E(u) - k^2 u \right] \right\}.
\]

\[
v = - \frac{2A}{abk^2} \cdot y \left\{ (1-2\nu) \left[ E(u) - \left( \frac{b}{a} \right)^2 u - k^2 \cdot \frac{\text{sn} \cdot \text{cn} u}{\text{dn} u} \right] + \frac{E(k)}{K(k)} \left[ u - E(u) + k^2 \cdot \frac{\text{sn} \cdot \text{cn} u}{\text{dn} u} \right] \right\}.
\]

\[
w = 2(1-\nu) \frac{A}{ab^2} \lim_{z \to 0} \left[ z \cdot \frac{ds}{\sqrt{Q(s)}} \right] = \frac{4(1-\nu)A}{ab^2} \lim_{z \to 0} \left\{ z \left[ \frac{\text{sn} \cdot \text{dn} u}{\text{cn} u} - E(u) \right] \right\}.
\]

Now, let \( u_0, v_0, \) and \( w_0 \) be the displacements of the crack surfaces. Then as \( \xi \to 0 \):

\[
\begin{align*}
\text{sn} \ u & \to 1, \text{cn} \ u \to 0, \text{dn} \ u \to \frac{b}{a}, \ E(u) \to E(k).
\end{align*}
\]

and eqs. (40) simply reduce to

\[
u_0 = - \frac{2Ab}{a^3k^2} E(k) \cdot x \left\{ (1-2\nu) \left[ \frac{k(k)}{E(k)} - 1 \right] + \left( \frac{b}{a} \right)^2 \frac{E(k)}{K(k)} - 1 \right\}.
\]

\[
v_0 = - \frac{2Ab}{a^3k^2} E(k) \cdot y \left\{ (1-2\nu) \left[ \left( \frac{a}{b} \right)^2 - \frac{k(k)}{E(k)} \right] + 1 - \frac{E(k)}{K(k)} \right\}.
\]

\[
w_0 = \frac{4(1-\nu)A}{ab} \left( 1 - \frac{x^2}{a^2} - \frac{y^2}{b^2} \right)^{1/2}.
\]

In the special case of a penny-shaped crack, \( a = b, E(k) = K(k) = \pi/2 \), eqs. (41) may be further simplified as

\[-19-\]
\[
\begin{bmatrix}
  u_0 \\
  v_0
\end{bmatrix} = -\frac{(1+\nu)at_0}{2} \begin{bmatrix}
  x \\
  y
\end{bmatrix}, \quad w_0 = \frac{2(1+\nu)at_0}{\pi} \sqrt{1-\rho^2}.
\]

where \( \rho = r/a \) and \( r^2 = x^2 + y^2 \). The normal component of the displacement \( w_0 \) of the crack surface agree with eq. (90) in [3] only when the integrals in [3] are evaluated properly\(^9\). As a consequence, the variation of \( w_0 \) with \( \rho \) shown by Fig. 3 in [3] should also be changed accordingly.

The problem of a uniform steady heat flow disturbed by an insulated elliptical crack is equivalent to the one of assigning uniform temperature gradients to the crack surfaces. The thermal conditions are shown in eqs. (28) and

\[
\tau_{xz} = \tau_{yz} = 0, \xi = 0 : u = v = 0, \eta = 0.
\]

must be satisfied on the plane \( z = 0 \). From eqs. (20a), (20b), (21e), and (21f), these conditions may be put into the forms

\[
\frac{\partial^2 q}{\partial z^2} + \nu \frac{\partial}{\partial y} \left( \frac{\partial q}{\partial y} - \frac{\partial h}{\partial x} \right) = \frac{\partial \psi}{\partial x}, \xi = 0. \quad (43a)
\]

\[
\frac{\partial^2 h}{\partial z^2} + \nu \frac{\partial}{\partial x} \left( \frac{\partial h}{\partial x} - \frac{\partial q}{\partial y} \right) = \frac{\partial \psi}{\partial y}, \xi = 0. \quad (43b)
\]

\(^9\)The corrected expressions in Olesiak and Sneddon's paper [3], p. 253, should read as

\[
\psi(n) = \frac{2(1+\nu)at_0}{\pi} \frac{(\sin n - \eta \cos n)}{\eta^2}. \quad (88)
\]

with

\[
\int_0^t s Q(s) \, ds = \frac{2\pi}{\pi} \left( 1 - \sqrt{1-t^2} \right), \quad C = \frac{2\pi}{\pi}.
\]
and

\[ W(p) = \frac{2\theta a}{\pi a} \left[ (1-p^2)^{1/2} - \log (1 + \sqrt{1-p^2}) \right]. \]

Hence,

\[ W_0 = L_0 (1-p^2)^{1/2} \] (90)

where

\[ L_0 = \frac{2(1+\nu)e\theta a}{\pi}. \] (91)

and \( \theta_0 \) corresponds to \( T_0 \) in the present work.

where the right hand side of eqs. (43) are known quantities from eq. (30), and

\[ \frac{\partial g}{\partial z} = 0, \ \frac{\partial h}{\partial z} = 0, \ \eta = 0 \] (44)

Both \( g(x,y,z) \) and \( h(x,y,z) \) are even functions of \( z \). The character of eqs. (43) suggests that the problem can be readily solved by putting \(^{10}\)

\[ \frac{\partial g}{\partial z} = (x \frac{\partial}{\partial z} - z \frac{\partial}{\partial x}) \Omega, \] (45a)

\[ \frac{\partial h}{\partial z} = (y \frac{\partial}{\partial z} - z \frac{\partial}{\partial y}) \Omega. \] (45b)

Equations (45a) and (45b) represent the velocity potential of a rigid elliptical disk rotating about the y-axis and x-axis, respectively. \(^{11}\)

\(^{10}\)If \( H(x,y,z) \) is a harmonic function, i.e., \( \nabla^2 H(x,y,z) = 0 \), then \((x \frac{\partial}{\partial z} - z \frac{\partial}{\partial x}) H\) and \((y \frac{\partial}{\partial z} - z \frac{\partial}{\partial y}) H\) are also harmonic.

\(^{11}\)See [10], p. 145.
By virtue of eqs. (45), eqs. (20) render

\[
\begin{align*}
\text{u} &= -2(1-\nu) \left( \frac{3A}{\partial z} + z \frac{3}{\partial x} \left[ \Gamma + 2(1-\nu)\lambda \right] \right), \\
\text{v} &= -2(1-\nu) \left( y \frac{3\Omega}{\partial z} + z \frac{3}{\partial y} \left[ \Gamma + 2(1-\nu)\Omega \right] \right), \\
\text{w} &= 2(1-\nu) \psi - (1-2\nu) \Gamma + z \frac{3\Gamma}{\partial z}.
\end{align*}
\]

(46a)

(46b)

(46c)

Equations (21) may also be expressed in terms of the functions \( \lambda(x,y,z) \) and \( \Omega(x,y,z) \):

\[
\begin{align*}
\frac{\partial \sigma_{xx}}{\partial x} &= 2(1-\nu) \frac{3}{\partial z} \left( x \frac{3\lambda}{\partial y} + 1 \right) \Omega - 2 \frac{3\Gamma}{\partial z} + z \left[ \frac{3\xi}{\partial x} \sigma_{xx} - 2(1-\nu) \frac{\partial^2 \Omega}{\partial y \partial z} \right]. \\
\frac{\partial \sigma_{yy}}{\partial y} &= 2(1-\nu) \frac{3}{\partial z} \left( x \frac{3\lambda}{\partial y} + y \frac{3\Omega}{\partial x} \right) + z \left[ \frac{3\xi}{\partial y} \sigma_{yy} - 2(1-\nu) \frac{\partial^2 \Omega}{\partial x \partial z} \right]. \\
\frac{\partial \sigma_{zz}}{\partial z} &= z \frac{3\xi}{\partial z}.
\end{align*}
\]

(47a)

(47b)

(47c)

\[
\begin{align*}
\tau_{xy} &= -(1-\nu) \frac{3}{\partial y} \left( x \frac{3\lambda}{\partial y} - y \frac{3\Omega}{\partial z} \right) + z \left( \frac{3\xi}{\partial y} \left[ \Gamma + (1-\nu)(\lambda+\Omega) \right] \right) + (1-\nu) \frac{3\xi}{\partial x \partial y \partial z} \left[ \int_{x}^{y} z(\lambda-\Omega) \, dz \right].
\end{align*}
\]

(47d)

\[
\begin{align*}
\tau_{xz} &= (1-\nu) \frac{3}{\partial x} \left( y \frac{3\lambda}{\partial x} - x \frac{3\Omega}{\partial x} \right) + \frac{3}{\partial x} \left( z \frac{3\xi}{\partial y} + 1 \right) \Gamma \\
&\quad - (1-\nu) \frac{3\xi}{\partial x \partial y \partial z} \left[ \int_{x}^{y} z(\lambda-\Omega) \, dz \right].
\end{align*}
\]

(47e)

(47f)

where the following contractions has been made:

\[
\Gamma = \psi + \lambda + x \frac{3\lambda}{\partial x} + y \frac{3\Omega}{\partial y} + z \frac{3\Omega}{\partial z} + \frac{3\xi}{\partial x \partial z} \left[ \int_{x}^{y} z(\lambda-\Omega) \, dz \right].
\]

From eqs. (30), (43), and (45) follow then
\[
\frac{\partial}{\partial z} \left( x \frac{\partial}{\partial z} - z \frac{\partial}{\partial x} \right) \Lambda + \nu \left( \frac{\partial}{\partial y} \left( x \frac{\partial \Lambda}{\partial y} - y \frac{\partial \Lambda}{\partial x} \right) + \frac{\partial^3 \Lambda}{\partial x \partial y \partial z} \right) + \frac{\partial^3 \Lambda}{\partial x^3} \left[ \int_{0}^{\infty} z (\Lambda - n) \, dz \right] = \left( \frac{1 + \nu}{1 - \nu} \right) \frac{a_0 \rho_0}{2k^2} \left[ \frac{K(k)}{E(k)} - 1 \right] \left( \frac{b}{a} \right)^2 x, \xi = 0. 
\] 

\[
\frac{\partial}{\partial z} \left( y \frac{\partial}{\partial z} - z \frac{\partial}{\partial y} \right) \Omega + \nu \left( \frac{\partial}{\partial x} \left( y \frac{\partial \Omega}{\partial x} - x \frac{\partial \Omega}{\partial y} \right) + \frac{\partial^3 \Omega}{\partial x^3} \right) + \frac{\partial^3 \Omega}{\partial x^3} \left[ \int_{0}^{\infty} z (\Lambda - n) \, dz \right] = \left( \frac{1 + \nu}{1 - \nu} \right) \frac{a_0 \rho_0}{2k^2} \left[ 1 - \left( \frac{b}{a} \right)^2 \frac{K(k)}{E(k)} \right] y, \xi = 0. 
\] 

Taking \( \Lambda(x,y,z) \) and \( \Omega(x,y,z) \) in the forms

\[
\begin{bmatrix}
\Lambda \\
\Omega
\end{bmatrix} = \frac{1}{2} \begin{bmatrix}
B \\
C
\end{bmatrix} \int_{\xi}^{\infty} \left( \frac{x^2}{a^2+s} + \frac{y^2}{b^2+s} + \frac{z^2}{s} - 1 \right) \frac{ds}{\sqrt{Q(s)}}.
\]

the constants \( B \) and \( C \) may be solved from eqs. (48), which yield

\[
B = \frac{m_1 q_2 - m_2 q_1}{p_1 q_2 - p_2 q_1}, \quad C = \frac{m_1 p_2 - m_2 p_1}{q_1 p_2 - q_2 p_1}.
\]

The constants \( p_j, q_j \) and \( m_j \) (j=1,2) are

\[
p_1 = - \frac{E(k)}{b^2} + \frac{1}{a^2-b^2} \left( E(k) - K(k) + \nu \left[ \left( \frac{a}{b} \right)^2 E(k) - K(k) \right] - \left( \frac{a^2+b^2}{a^2} \right) K(k) - 2a^2 E(k) \right) \]

\[
q_1 = \frac{\nu}{a^2-b^2} \left[ E(k) - K(k) + \left( \frac{a^2+b^2}{a^2} \right) K(k) - 2a^2 E(k) \right],
\]

\[
m_1 = \left( \frac{1+\nu}{1-\nu} \right) \frac{a_0 \rho_0}{4k^2} \left[ \frac{K(k)}{E(k)} - 1 \right] \left( \frac{b}{a} \right)^2
\]

and

\[
p_2 = \frac{\nu}{a^2-b^2} \left[ K(k) - \left( \frac{a}{b} \right)^2 E(k) + \frac{(a^2+b^2)}{a^2-b^2} K(k) - 2a^2 E(k) \right].
\]
\[ q_2 = \frac{E(k)}{b^2} + \frac{1}{a^2-b^2} \left( k(k) - \left( \frac{a}{b} \right)^2 E(k) + v \left[ K(k) - E(k) + \frac{(a^2+b^2)K(k) - 2a^2E(k)}{a^2 - b^2} \right] \right) , \]

\[ m_2 = \left( \frac{1+v}{1-v} \right) \cdot \frac{\alpha \alpha Q_0}{4k^2} \left[ 1 - \left( \frac{b}{a} \right)^2 \frac{K(k)}{E(k)} \right] . \]

The solution is essentially complete and is a complicated function of the material constants and the geometry of the problem.

A straightforward calculation employing eqs. (46) gives the displacement components\(^\text{12}\) for \( z = 0 \)

\[
\begin{align*}
\begin{cases}
  u \\
  v
\end{cases} & = -2(1-v) \begin{cases}
  Bx \\
  Cy
\end{cases} \\
\end{align*}
\]

\[ a^3k^2w = [ u-E(u) ] \begin{cases}
  \left\{ \left( \frac{1+v}{1-v} \right) \frac{ab^2aQ_0}{4E(k)} - (1-2v) \right\} x + \frac{v^2}{k^2} \\
  + \left\{ \left( \frac{1+v}{1-v} \right) \frac{ab^2aQ_0}{4E(k)} - (1-2v) \right\} \left[ 3B + (1-2v) \frac{b}{ak} \right] x + (1-2v) \frac{2C}{ak} \end{cases}.
\]

\[ \left\{ \frac{\text{sn} u \ \text{dn} u}{\text{cn} u} \right\} \cdot y^2 \\
- \left\{ a^2k^2 \left[ \left( \frac{1+v}{1-v} \right) \frac{ab^2aQ_0}{4E(k)} - (1-2v) \right] B \right\} + (1-2v) (B-C) x^2 \right\} u \\
+ (1-2v) (B-C) x^2 \ \text{sn} u \ \text{cn} u \ \text{dn} u .
\]

\(^12\)The results of the integrals are tabulated in Appendix (2).
In the same way as before by setting $\xi = 0$, the displacements of the crack surfaces are found:

$$
\begin{pmatrix}
\{ u_0 \\
\{ v_0 \\
\end{pmatrix} = \begin{pmatrix}
- \frac{4(1-v)}{ab} \\
\frac{1}{2}
\end{pmatrix}
\begin{pmatrix}
\{ Bx \\
\{ Cy \\
\end{pmatrix}
(1 - \frac{x^2}{a^2} - \frac{y^2}{b^2})^{1/2}.

(52a)
$$

$$
a^3 k^2 \omega = \left[ K(k) - E(k) \right] \left[ \left( \frac{1+v}{1-v} \right) \frac{ab^2 \alpha Q_0}{4E(k)} - (1-2v) \left[ 3B + (1- \frac{2}{k^2}) (B-C) \right] \right] x^2 + \frac{y^2}{k^2}.
$$

(52b)

In the limit as $a = b$, eqs. (50) shows that

$$
B = C = - \left( \frac{1+v}{1-v} \right) \frac{a^3 \alpha Q_0}{b^\pi}.
$$

(53)

Because of rotational symmetry of the circular crack problem, the displacements $u$ and $v$ may be combined as $(u_0^2 + v_0^2)^{1/2}$ to give the radial component $u_r$:

$$
3^{\frac{n-2}{2}} \cdot \frac{u_r}{(1+v) \alpha^2 \alpha Q_0} = \sqrt{\frac{2}{\pi}} \rho \cdot \sqrt{1-\rho^2}, \quad \rho < 1.
$$

(53)
The normal displacement $w_0$ is

\[
\frac{(1-\nu)}{1+\nu} \cdot \frac{w_0}{a^2 a_0} = \frac{1}{4} \left[ (1-\nu) \rho^2 - \frac{2}{3} (2-\nu) \right], \quad \rho < 1 .
\]  

(54a)

and

\[
\frac{(1-\nu)}{1+\nu} \cdot \frac{w_0}{a^2 a_0} = \frac{1}{2 \pi} \left[ (1-\nu) \rho^2 - \frac{2}{3} (2-\nu) \right] \sin^{-1} \left( \frac{1}{\rho} \right)
- (1-\nu) \sqrt{\rho^2 - 1} \quad \rho > 1 .
\]  

(54b)

Eqs. (53) and (54) check with eqs. (26) and (27) in [5], respectively, when the expression for $w_0$ in [5] is corrected. The temperature gradient $Q_0$ corresponds to $\tau$ in [5].

The computation of thermal stresses will be considered in the next section.

\[13\]

For $\rho > 1$, $w_0$ in Florence and Goodier's paper [5] should be corrected.

\[
\sqrt{2\pi} \left( \frac{1-\nu}{1+\nu} \right) \frac{w_0}{a^2 a_0} = - \frac{1}{3} \sqrt{2} \frac{1}{\pi} \rho \cdot {}_2F_1 \left( \frac{1}{2}, \frac{1}{2}, \frac{3}{2}, \frac{1}{\rho^2} \right)
+ \frac{2(1-2\nu)}{45 \sqrt{2\pi}} \cdot \frac{1}{\rho^3} \cdot {}_2F_1 \left( \frac{3}{2}, \frac{3}{2}, \frac{7}{2}, \frac{1}{\rho^2} \right), \quad \rho > 1 .
\]

where ${}_2F_1 (a,b;c;z)$ is Gauss' hypergeometric series. Moreover, these hypergeometric series can be reduced to elementary functions by means of Gauss' recursion formulas [9] and some properties of the hypergeometric series. The results are

\[
\frac{1}{\rho} {}_2F_1 \left( \frac{1}{2}, \frac{1}{2}, \frac{3}{2}, \frac{1}{\rho^2} \right) = \frac{3}{4} \left[ \sqrt{\rho^2 - 1} - (\rho^2 - 1) \sin^{-1} \frac{1}{\rho} \right],
\]

\[
\frac{1}{\rho^3} \cdot {}_2F_1 \left( \frac{3}{2}, \frac{3}{2}, \frac{7}{2}, \frac{1}{\rho^2} \right) = \frac{45}{4} \left[ (\rho^2 - \frac{2}{3}) \sin^{-1} \frac{1}{\rho} - \sqrt{\rho^2 - 1} \right] .
\]

There is also a misprint in [5], eq. (27), where the factor $\pi/4$ should read as $1/4$.  

- 26 -
Crack-Border Thermal Stresses and Stress-Intensity Factors

A knowledge of thermal stresses in a small region ahead of the crack is essential in the investigation of the stability behavior of cracks. For instance, the Griffith-Irwin theory of fracture [7] is based upon the concept that the onset of rapid crack extension occurs when the magnitude of crack-border stress field or simply the stress-intensity factor reaches some critical value. For a given configuration of the crack, this value will in general, depend upon the properties of the material such as the shear modulus, Poisson's ratio, and the coefficient of thermal expansion, etc. Hence, attention will be focused on the determination of stress-intensity factors $k_j (j=1, 2, 3)$, where each one of the $k$-factors refers to a particular mode of crack surface displacement. The elliptical crack problem will be used as an example.

The "opening mode" of crack extension, governed by $k_1$, arises in the symmetrical problem. For the mere purpose of finding $k_1$, it suffices to calculate $\sigma_{zz}$ in the plane $z = 0$, outside the elliptical crack region. By way of eqs. (32) and (13c)\textsuperscript{14}

$$\frac{\sigma_{zz}}{2\mu} = A \left\{ \frac{2}{(a^2+\xi)^{1/2}} - \int_{\xi}^{\infty} \frac{(2s+a^2+b^2)ds}{(a^2+s)(b^2+s)\sqrt{Q(s)}} \right\}$$

$$+ \frac{1}{1-\nu} \cdot \frac{a\alpha T_0}{4K(k)} \int_{\xi}^{\infty} \frac{ds}{\sqrt{Q(s)}}.$$

$$= \frac{(1+\nu)}{1-\nu} \frac{a\alpha T_0}{2} \left\{ \frac{1}{E(k)} \left[ \frac{1}{(a^2+\xi)^{1/2}} - \frac{ab^2}{(b^2+\xi)^{1/2}} \right] - E(u) + \frac{\text{sn} u \text{cn} u}{\text{dn} u} \right\}$$

$$+ \frac{u}{K(k)} \right\}, \quad n = 0 \quad .$$

\textsuperscript{14}Refer to Appendix (1) for solutions to integrals.
In the neighborhood of the crack border, the ellipsoidal coordinates \( \xi \) and \( \zeta \) have the limits\(^{15} \)

\[
\xi = 2abr \left( a^2 \sin^2 \phi + b^2 \cos^2 \phi \right)^{-1/2}, \tag{56a}
\]

\[
\zeta = - \left( a^2 \sin^2 \phi + b^2 \cos^2 \phi \right), \tag{56b}
\]

which are valid for \( \eta = 0 \) and \( r \ll 1 \). The small distance \( r \) in the plane \( z = 0 \) is measured normal to the crack border and \( \phi \) is the angle in the parametric equations of an ellipse. Substituting eq. (56a) into (55), the expansion of \( \sigma_{zz} \) for small values of \( r \) (or \( \xi \)) is

\[
\sigma_{zz} = \frac{(1+v)}{1-v} \frac{\mu aT_0}{E(k)} b \left( a^2 \sin^2 \phi + b^2 \cos^2 \phi \right)^{1/4} \frac{1}{\sqrt{2r}} + O(r^{1/2}). \tag{57}
\]

The stress-intensity factor \( k_1 \) can now be extracted from eq. (57) as

\[
k_1 = \frac{(1+v)}{1-v} \frac{\mu aT_0}{E(k)} b \left( a^2 \sin^2 \phi + b^2 \cos^2 \phi \right)^{1/4}, \quad a > b. \tag{58}
\]

The variation of \( k_1 \) with the angle \( \phi \) is plotted in Fig. 1 for \( v = 1/3 \) and different values of the ratio \( a/b \). A glance at the curves shows that \( k_1 \) is always greatest at \( \phi = 90^\circ \), i.e., the intersection of the crack boundary with the minor axis of the ellipse. Thus, crack propagation, if it occurs, would first take place at the point \((0,b,0)\), and tend to produce a penny-shaped crack. This is a brief physical interpretation of the Griffith-Irwin concepts of fracture.

\(^{15}\)See [6], eqs. (52a) and (55).
The remaining strength of a solid whose continuity is interrupted by a circular crack may be estimated from eqs. (57) and (58) by setting \( a = b \) and \( \xi = r^2 - a^2 \). Consequently:

\[
\frac{a_{zz}}{2\mu} = \left(\frac{1+\nu}{1-\nu}\right) \frac{\alpha T_o}{\pi} (\rho^2-1)^{-1/2} \quad \rho > 1
\]

and

\[
k_1 = \left(\frac{1+\nu}{1-\nu}\right) \frac{2\mu a T_o}{\pi} \sqrt{a}
\]

The stress-intensity factors \( k_2 \) and \( k_3 \) correspond, respectively, to the "edge-sliding" and "tearing" modes of fracture. Their evaluation calls for the expressions \( \tau_{xz} \) and \( \tau_{yz} \) as \( z \to 0 \). It is found from eqs. (47e), (47f) and (49) that:

\[
\frac{\tau_{xz}}{2\mu} = \left[ \frac{(a^2+\xi)(a^2+\xi)}{a^2 - b^2} \right]^{1/2} \left[ \left(\frac{1+\nu}{1-\nu}\right) \frac{ab^2a0}{4E(k)} + B + \nu C \right] \int_0^\infty \frac{ds}{\xi (a^2+s)\sqrt{Q(s)}}
\]

- \( B \left[ \frac{2}{\sqrt{Q(\xi)}} - \int_0^\infty \frac{(2s+a^2+b^2)ds}{\xi (a^2+s)(b^2+s)\sqrt{Q(s)}} \right] + \nu \int_0^\infty \frac{ds}{\xi (b^2+s)\sqrt{Q(s)}} \]

+ \[ \frac{2\nu(b^2+\xi)}{\xi^{1/2} (\xi-\xi)(b^2-a^2)} \left[ B \left(\frac{a^2+\xi}{b^2+\xi}\right)^{1/2} \left(1 - \frac{\xi}{a^2+\xi}\right) - C \left(\frac{b^2+\xi}{a^2+\xi}\right)^{1/2} \left(1 - \frac{\xi}{b^2+\xi}\right) \right] \]

+ \[ \nu (B - C) \int_0^\infty \frac{s ds}{\xi (a^2+s)(b^2+s)\sqrt{Q(s)}} \] , \( n = 0 \) .

\[ (60a) \]

16 The factor of \( a/3 \) should be taken out of eq. (92) in [3].

17 The integrals are tabulated in Appendix (2).
\[
\frac{\tau_{yz}}{2\mu} = \left[ \frac{(b^2+\xi)(b^2+\zeta)}{b^2-a^2} \right]^{1/2} \cdot \left( \left[ \frac{(1+v)}{1-v} \frac{ab^2aQ_o}{4E(k)} + C + vB \right] \int_\xi^\infty \frac{ds}{(b^2+s)\sqrt{Q(s)}} \right.

- C \left[ \frac{2}{\sqrt{Q(\xi)}} - \int_\xi^\infty \frac{(2s+a^2+b^2)ds}{(b^2+s)(b^2+s)\sqrt{Q(s)}} + v \int_\xi^\infty \frac{ds}{(a^2+s)\sqrt{Q(s)}} \right]

- \frac{2v(a^2+\xi)}{\xi^{1/2}(\xi-\zeta)(a^2-b^2)} \left[ B \left( \frac{a^2+\xi}{b^2+\xi} \right)^{1/2} \left( 1 - \frac{\xi}{a^2+\xi} \right) - C \left( \frac{b^2+\xi}{a^2+\xi} \right)^{1/2} \left( 1 - \frac{\xi}{b^2+\xi} \right) \right]

- v(B-C) \int_\xi^\infty \frac{s ds}{(a^2+s)(b^2+s)\sqrt{Q(s)}} \right)

= 0 \quad (60b)
\]

where \(B\) and \(C\) are given by eq. (50). Near the crack boundary, eqs. (56) may be applied to simplify eqs. (60):

\[
\frac{\tau_{xz}}{2\mu} = \frac{2}{ab} \sqrt{\frac{a}{b}} \left[ \left( \frac{a}{b} \right)^2 B - C \right] \left( \frac{v}{a^2 \sin^2 \phi + b^2 \cos^2 \phi} \right)^{1/4} - B \left( \frac{a^2 \sin^2 \phi + b^2 \cos^2 \phi}{(r \sqrt{2})} \right) + 0 \left( r^{1/2} \right) \quad (61a)
\]

\[
\frac{\tau_{yz}}{2\mu} = \frac{2}{ab} \sqrt{\frac{b}{a}} \left[ \left( \frac{b}{a} \right)^2 C - B \right] \left( \frac{v}{a^2 \sin^2 \phi + b^2 \cos^2 \phi} \right)^{1/4} - C \left( \frac{a^2 \sin^2 \phi + b^2 \cos^2 \phi}{(r \sqrt{2})} \right) + 0 \left( r^{1/2} \right) \quad (61b)
\]

Before \(k_j (j=2,3)\) can be found, the following transformations

\[
\tau_{nz} = \tau_{xz} \cos \beta + \tau_{yz} \sin \beta \quad \text{(62a)}
\]

\[
\tau_{tz} = - \tau_{xz} \sin \beta + \tau_{yz} \cos \beta \quad \text{(62b)}
\]

should be performed to obtain the normal and tangential components of the shear stress. In eqs. (62), \(\beta\) is the angle between the x-axis and the line.
normal to the crack border in the plane $z = 0$. It is not difficult to show that for a given value of $\phi$, i.e., a fixed position on the crack boundary, $\beta$ is known either from

$$\sin \beta = a \sin \phi \left( a^2 \sin^2 \phi + b^2 \cos^2 \phi \right)^{-1/2}.$$ 

or

$$\cos \beta = b \cos \phi \left( a^2 \sin^2 \phi + b^2 \cos^2 \phi \right)^{-1/2}.$$ 

Putting eqs. (61) into (62), $\tau_{nz}$ and $\tau_{tz}$ may be written as

$$\tau_{nz} = \frac{k_2}{\sqrt{2r}} + 0 \left( r^{1/2} \right), \quad \tau_{tz} = \frac{k_3}{\sqrt{2r}} + 0 \left( r^{1/2} \right).$$

where

$$k_2 = -\frac{4 \mu}{\sqrt{ab}} \left( a^2 \sin^2 \phi + b^2 \cos^2 \phi \right)^{-1/4} \left( B \cos^2 \phi + C \sin^2 \phi \right).$$  

$$k_3 = \frac{4 \mu (1-\nu)}{\sqrt{ab}} \left( a^2 \sin^2 \phi + b^2 \cos^2 \phi \right)^{-1/4} \left( \frac{a}{b} B - \frac{b}{a} C \right) \sin \phi \cos \phi.$$

It is worthwhile to mention that in the skew-symmetrical problem of an elliptical crack, there exists a combination of "edge-sliding" and "tearing" movements of the crack surfaces as both $k_2$ and $k_3$ occur simultaneously. Hence, the shape to which the crack would grow will depend upon a function of $k_2$, $k_3$ and is no longer a priori evident as in the case of the opening mode. For $\nu = 1/3$, the values of $k_2$ and $k_3$ against $\phi$ are shown in curves by Figs. 2 and 3. Note that $k_2$ varies with $\phi$ in a manner similar to $k_1$ as in Fig. 1. Inspection of Fig. 3 reveals the interesting fact that the four points at which the crack border intersects the major and minor axes are under the action of "edge-sliding" type of displacement only, since $k_3$
vanishes at those places. The maximum values of $k_3$ shift as the ellipticity is changed. This is clearly illustrated in Fig. 3.

In the degenerate case of decreasing ellipticity, i.e., as $b\to a$, eqs. (63) reduce to

$$ k_2 = \left( \frac{1+v}{1-\nu} \right)^{3/2} \frac{2 \mu \alpha Q_0 a}{\pi} , \quad k_3 = 0 \quad (64) $$

and the "tearing" mode disappears completely. This result is in agreement with that obtained by Florence and Goodier [5].

It should be emphasized that the angular distribution of the three-dimensional thermal stresses near the crack border is found to be the same as those in an elastic body undergoing deformation at constant temperatures [6]. The two-dimensional case was discussed by Sih in [12]. In retrospect, this justifies the application of the Griffith-Irwin theory of fracture to cracks owing to thermal disturbances.

---

18 The sum of the normal stresses, $(\sigma_x + \sigma_y)$ or $(\sigma_{xx} + \sigma_{yy})$ in [5], on the plane of the penny-shaped crack is incorrect. It can be seen from eqs. (47a), (47b) and (49) in the present paper that

$$ \left( \frac{ab}{8\mu} \right) (\sigma_{xx} + \sigma_{yy})_{z=0} = - \left[ \left( \frac{1+v}{1-\nu} \right) \frac{ab^2 \alpha Q_0 a}{2\pi(k)} + (1+v) (B+C) \right] \left( 1 - \frac{x^2}{a^2} - \frac{y^2}{b^2} \right)^{1/2} + (1+v) \left( \frac{a x^2}{a^2} + C \frac{y^2}{b^2} \right) \left( 1 - \frac{x^2}{a^2} - \frac{y^2}{b^2} \right)^{-1/2} , \quad \xi = 0 \quad . $$

and hence, for $a = b$, the above equation becomes

$$ \frac{(1-v)}{1+v} \left( \frac{ab}{4\mu} \alpha \frac{Q_0 a}{a} \right) = - \frac{1}{\pi} \left[ (1-v) \sqrt{1-\rho^2} + \frac{1}{3} (1+v) \sqrt{1-\rho^2} \right] , \quad \rho < 1 \quad . $$

which is the revised form of eq. (28) in [5].
Remarks on a Class of Boundary Problems

A more general approach to the problem of finding the steady-state temperature field in ellipsoidal coordinates will be considered. Once the structure of $T(x,y,z)$ is known, a number of thermoelastic problems of cracks may be solved by the method described earlier. For brevity sake, discussion will be restricted to the symmetrical problem where

$$T(x,y,z) = T(x,y, - z) .$$

The formulation for the skew-symmetrical temperature problem follows in the same way.

Suppose that the surfaces of an elliptical crack is thermally disturbed with the following boundary conditions:

$$T = T(x,y), \xi = 0 \quad .$$

$$\frac{\partial T}{\partial z} = 0 \quad , \quad n = 0 \quad .$$

which reduces to eqs. (24) for $T(x,y,0) = \text{constant}$. A well-known solution of eq. (1) in potential theory is [13]

$$T(x,y,z) = \frac{1}{R} \int \int \frac{q(x',y')}{R} \, dx'dy' \quad ,$$

where

$$R^{-1} = \left[ (x-x')^2 + (y-y')^2 + z^2 \right]^{-1/2}$$

and $q(x', y', 0)$ is the density of a distribution of mass in the space $(x', y', z')$. The integral in eq. (66) is extended over the region occupied by the ellipse $x^2/a^2 + y^2/b^2 = 1$. The requirement is that $T(x,y,z)$ must be sufficiently regular at infinity. This is satisfied as
\[ T + R_0 \int \int_{\Sigma} q(x',y') \, dx'\,dy' , \quad \text{when } R_0 \to \infty \]

where

\[ R_0 = (x^2 + y^2 + z^2)^{1/2} . \]

Now, eq. (66) may be inserted into the last of eq. (5) and the result can be integrated to admit the representation

\[ \psi(x,y,z) = \frac{a}{z} \left( \frac{1+\nu}{1-\nu} \right) . \frac{1}{2\pi} \int \int_{\Sigma} q(x',y') \log (R + z) \, dx'\,dy' . \]  

Apart from the factor \( \frac{a}{z} \left( \frac{1+\nu}{1-\nu} \right) \), eq. (67) is Boussinesq's three-dimensional logarithmic potential for a disk in the shape of \( \Sigma \), whose mass density is \( q(x,y) \). While \( \psi(x,y,z) \) has continuous derivatives vanishing at infinity, the function \( \psi(x,y,z) \) itself is unbounded as \( R \to \infty \), since

\[ \psi \to [ \log (R + z) ] . \frac{1}{2\pi} \int \int_{\Sigma} q(x,y) \, dx\,dy , \quad \text{when } R \to \infty \]

The boundary condition, eq. (65a), can be satisfied by taking

\[ T(x,y) = \frac{1}{2\pi} \int \int_{\Sigma} \frac{q(x',y')}{(x-x')^2 + (y-y')^2} \log (R + z) \, dx'\,dy' . \]  

Integral of this type is used in the contact problems of the theory of elasticity, in particular, the problem of a perfectly rigid elliptical punch on an elastic half-space [11].

In ellipsoidal coordinates, the temperature field may be taken as

\[ T(x,y,z) = \int_\xi^\infty \phi(\omega) \frac{ds}{\sqrt{Q(s)}} . \]  

where

\[ \omega(s) = 1 - \frac{x^2}{a^2+s} - \frac{y^2}{b^2+s} - \frac{z^2}{s} . \]
and $\phi(\omega)$ is any twice differentiable function in the interval (0,1) with finite one-sided derivatives at the boundary points of the interval. Note that eqs. (65) are satisfied by

$$\frac{\partial T}{\partial z} = -\frac{2}{ab} (\xi \eta \zeta) \int_{\xi}^{\infty} \phi'(\omega) \frac{ds}{\sqrt{Q(s)}} - 2 \phi(0) \frac{\int_{\xi}^{0} \xi (a^2 + \xi)(b^2 + \xi)}{ab (\xi - \eta)(\xi - \zeta)} \frac{1}{\sqrt{Q(s)}}. \quad (70a)$$

and

$$T(x,y) = \int_{0}^{\infty} \phi \left(1 - \frac{x^2}{a^2 + s} - \frac{y^2}{b^2 + s}\right) \frac{ds}{\sqrt{Q(s)}}. \quad (70b)$$

It should be pointed out that if $\phi(\omega)$ is a polynomial of degree $n$ in $x^2$ and $y^2$, then $T(x,y)$ will be another polynomial of the same degree in $x^2$ and $y^2$.

Alternatively, eq. (69) may also be used to satisfy the boundary conditions

$$\frac{\partial T}{\partial z} = \begin{cases} q(x,y), & \xi = 0, \\ 0, & n = 0. \end{cases} \quad (71a)$$

By taking $q(x,y)$ to be a function of the variable

$$z = 1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}. \quad (71b)$$

then eq. (71a) gives

$$\phi(\omega) = -\frac{ab}{2\pi} \int_{0}^{\omega} \frac{q(z) \, dz}{\sqrt{\omega - z}}. \quad (72)$$

In particular, if

$$q(z) = q_0 z^n. \quad (73)$$
eq. (72) becomes

$$\Phi(\omega) = - \frac{abq_0}{2\sqrt{\pi}} \frac{r}{r} \left( n + \frac{3}{2} \right) \int_0^\infty [\omega(s)]^{n+1/2} ds.$$  

The temperature distribution may also be computed as

$$T(x,y,z) = \frac{abq_0}{2\sqrt{\pi}} \frac{r}{r} \left( n + \frac{3}{2} \right) \int_0^\infty [\omega(s)]^{n+1/2} \frac{ds}{\sqrt{\xi(s)}}$$  \hspace{1cm} (74)

For $n = p - 1/2$, where $p$ is a positive integer, the integrand in eq. (74) can be expanded and the integration may be carried out term by term\(^{19}\).

A few cases of eq. (74) are

(a) $n = -1/2$, eq. (74) reduces to eq. (25) with

$$q_0 = \frac{T_0}{bK(k)}.$$  

(b) The integral corresponding to $n = 0$ has yet to be evaluated.

(c) The temperature $T(x,y,z)$ for $n = 1/2$ is

\(^{19}\)In the special case of $a = b$, eq. (74) can be integrated for all values of $n$ giving

$$T = \frac{bq_0}{\sqrt{\pi}} \frac{r}{r} \left( n + \frac{3}{2} \right) (k')^{2(n+1)} I_{2(n+1)}$$  

where

$$I_{2n} = \int_0^K \frac{dt}{(dn-t)^{2n}}.$$  

- 36 -
\[ T = - \frac{bgqK(k)}{2a^2k^2} \left( a^2k^2 - \left[ \frac{1 - E(k)}{K(k)} \right] x^2 - \left[ \frac{\left( \frac{a}{b} \right)^2 E(k)}{K(k)} - 1 \right] y^2 \right), \quad \xi = 0. \]

**Conclusion**

Three-dimensional problems of cracks in thermoelasticity have been formulated. The displacements and stresses are expressed in terms of potential functions, which are valid for planes of discontinuities bounded by smooth curves. Of fundamental interest is the problem of a flat elliptical crack whose surfaces are thermally disturbed. Exact solutions are obtained and reduced to the limiting cases discussed by previous authors [3-5].

Several essential features of the stability behavior of an elliptical crack, heated on its surfaces, are discussed in connection with the Griffith-Irwin theory of fracture. The concept of stress-intensity factor is introduced. In general, all three types of \( k \)-factors are present in structural members undergoing thermal changes. Therefore, a criterion of fracture will have to depend on a function of \( k_1, k_2, \) and \( k_3 \) to reach some critical value, say \( f_{cr} \) at which unstable crack extension would start. The function \( f_{cr} \) must be determined experimentally.

**APPENDIX**

(1) The following integrals are essential in the calculation of displacements and thermal stresses:

\[ \int_{\xi}^{\infty} \frac{ds}{Q(s)} = \frac{2}{a} u, \quad (75a) \]

\[ \int_{\xi}^{\infty} \frac{ds}{(a^2+s)\sqrt{Q(s)}} = \frac{2}{a^3k^2} \left[ u - E(u) \right], \quad (75b) \]

\[ \int_{\xi}^{\infty} \frac{ds}{(b^2+s)\sqrt{Q(s)}} = \frac{2}{a^3k^2} \left[ \frac{(a)}{b^2} E(u) - u - \frac{(a^2-b^2)}{b^2} \frac{sn u cn u}{dn u} \right], \quad (75c) \]
\[ \int_{\xi}^{\infty} \frac{s \, ds}{(a^2+s)^2 \sqrt{Q(s)}} = \frac{2}{a^3 k^2} \left[ \frac{(a^2+b^2)}{b^2} E(u) - 2 \frac{k^2}{k^2} u - \frac{a^2-b^2}{b^2} \frac{u}{du} \right], \quad (75g) \]

\[ \int_{\xi}^{\infty} \frac{s \, ds}{(a^2+s)(b^2+s)^2} = \frac{2}{a^3 k^2} \left[ \frac{(a^2+b^2)}{b^2} E(u) - 2 \frac{k^2}{k^2} u - \frac{a^2-b^2}{b^2} \frac{u}{du} \right], \quad (75h) \]

(2) For the skew-symmetrical part of the problem, it is necessary to find

\[ \int_{z}^{\infty} \frac{z \, j (x,y,z) \, dz}{z} = \int_{z}^{\infty} \Omega (x,y,z) \, dz \]

where the functions \( \Lambda (x,y,z) \) and \( \Omega (x,y,z) \) are themselves integrals given by eq. (49). Hence, integral of the type

\[ I = \frac{1}{2} \int_{\xi}^{\infty} z \left[ \int_{\xi}^{\infty} \left( \frac{x^2}{a^2+s} + \frac{y^2}{b^2+s} + \frac{z^2}{s} - 1 \right) \frac{ds}{\sqrt{Q(s)}} \right] \, dz \]

is involved. Using formula given by eq. (38), eq. (76) becomes

\[ I = - \frac{1}{8} \int_{\xi}^{\infty} \left( \frac{x^2}{a^2+s} + \frac{y^2}{b^2+s} + \frac{z^2}{s} - 1 \right)^2 \frac{ds}{\sqrt{Q(s)}}. \quad (77) \]

From eq. (77) follows then

\[ \frac{\delta^{2}I}{\delta x^{2}} = - \frac{1}{2} \int_{\xi}^{\infty} \left( \frac{x^2}{a^2+s} + \frac{y^2}{b^2+s} + \frac{z^2}{s} - 1 \right) \frac{s \, ds}{(a^2+s)^2 \sqrt{Q(s)}} = x^2 \int_{\xi}^{\infty} \frac{s \, ds}{(a^2+s)^2 \sqrt{Q(s)}} \]

\( (78a) \)
\[
\frac{\partial^3 I}{\partial x^2 \partial y} = -y \int_0^\infty \frac{s \, ds}{\xi (a^2+s)(b^2+s)} + \frac{2 \, x^2 y \, \xi^{3/2}}{(a^2+\xi)^{3/2}(b^2+\xi)^{1/2}(\xi-\eta)(\xi-\zeta)} \quad \text{(78b)}
\]
\[
\frac{\partial^3 I}{\partial x \partial y^2} = -x \int_0^\infty \frac{s \, ds}{\xi (a^2+s)(b^2+s)} + \frac{2 \, xy^2 \, \xi^{3/2}}{(a+\xi)^{1/2}(b^2+\xi)^{3/2}(\xi-\eta)(\xi-\zeta)} \quad \text{(78c)}
\]

Similar expressions for partial derivatives of I with respect to x,y,z may be obtained for the computation of stresses and displacements. It is now apparent that the solutions to the integrals in eqs. (78) can be obtained from eqs. (75).

A general formulation of the three-dimensional thermoelastic equations for problems involving planes of discontinuities is presented. Harmonic functions are constructed from which the stresses and displacements may be obtained. The thermoelastic potential for symmetric distribution of temperatures on the crack surfaces is related to Boussinesq's three-dimensional logarithmic potential for a disk in the shape of the crack. Closed form solutions are obtained for the cases of crack surfaces exposed to uniform temperatures and/or temperature gradients. The possibility of extending the Griffith-Irwin theory of fracture to cracks under thermal disturbance is also discussed.

Fracture Mechanics

1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.

2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. REPORT DATE: Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.

7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. NUMBER OF REFERENCES: Enter the total number of references cited in the report.

8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subcontract number, system numbers, task number, etc.

9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

(1) "Qualified requesters may obtain copies of this report from DDC."

(2) "Foreign announcement and dissemination of this report by DDC is not authorized."

(3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through"

(4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through"

(5) "All distribution of this report is controlled. Qualified DDC users shall request through"

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. SUPPLEMENTARY NOTES: Use for additional explanatory notes.

12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.

13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, roles, and weights is optional.
