This research has been sponsored in part by the Logistics & Mathematical Statistics Branch, Office of Naval Research, Washington D.C. under Contract P61052 67 C 0094. Reproduction in whole or in part is permitted for any purpose of the United States Government.
Let $S$ be an arbitrary set, and $\Sigma$ a field of subsets of $S$. Let $v$ be a bounded real function defined on $\Sigma$ with non-negative values, such that $v(\emptyset) = 0$ and $v(S) > 0$. We shall call the triple $[S, \Sigma, v]$ a game; $S$ is the set of players, $\Sigma$ the set of coalitions and $v$ is the payoff function. An outcome of the game is a bounded additive real function $\lambda$ defined on $\Sigma$, for which $\lambda(S) = v(S)$. If an outcome $\lambda$ fulfils $\lambda(A) \geq v(A)$ for each $A \in \Sigma$, it belongs, by definition, to the core of the game. For $A \in \Sigma$, let $\chi_A$ be the characteristic function of $A$, i.e. $\chi_A(s) = 1$ if $s \in A$ and $\chi_A(s) = 0$ if $s \in S \setminus A$, for all $s \in S$. A game is balanced if

$$\sup_{\Sigma} \sum_{i} a_i v(A_i) \leq v(S),$$

when the sup is taken over all finite sequences of $a_i$ and $A_i$, where the $a_i$ are non-negative numbers, the $A_i$ are in $\Sigma$, and $\sum_{i} a_i \chi_{A_i} = \chi_S$.

---

* $\Sigma$ fulfills: (a) $\emptyset \in \Sigma$. (b) $A \in \Sigma \Rightarrow S \setminus A \in \Sigma$. (c) $A \in \Sigma, B \in \Sigma \Rightarrow A \cup B \in \Sigma$.

** $v$ is often called the "characteristic function" of the game. We refrain from that terminology because the same term is used with a different meaning in this paper.

*** It is easy to verify that this sup does not change even if it is constrained by $\sum_{i} a_i \chi_{A_i} = \chi_S$ (instead of the inequality); also, for balanced games, the sup equals $v(S)$. 
This concept is due to L.S. Shapley [2], who proved that a finite game \((S, \Sigma, \mu)\) has a non-empty core if and only if it is balanced. In this paper we extend this result to an arbitrary set \(S\).

U. Liberman [3] dealt with the case when \((S, \Sigma, \mu)\) is a finite, separable, non-atomic measure space \((\mu \text{ is a measure})\). He required, in addition to the balancedness condition, that the payoff function \(v\) be continuous on \((\Sigma, \rho)\) where \(\rho\) is the metric induced on \(\Sigma\) by \(\mu\). Then, using Shapley's theorem for the finite case, he proved the existence of a measure in the core, absolutely continuous w.r.t. \(\mu\). We prove such a result with weaker assumptions.

The author wishes to thank Professor R.J. Aumann and Dr. B. Peleg for some helpful conversations.

The Main Theorem A game has a non-empty core iff it is balanced.

Proof We shall show that a balanced game has a non-empty core. The other side of the implication is easily verified.

Let \(X\) denote the linear space of all finite real combinations of characteristic functions of sets in \(\Sigma\). (The completion of \(X\) in the sup metric is denoted in Dunford and Schwartz [1] by \(B(S, \Sigma)\).) For non-negative vectors \(x\) in \(X\), (i.e. \(x(s) \geq 0\) for \(s \in S\)) we define:

\[
p(x) = \sup_{\sigma_1 a_1 v(\Lambda_1)},
\]
where the sup is taken over all finite sequences of \( a_i \) and \( A_i \), where the \( a_i \) are non-negative real numbers, the \( A_i \) are in \( \Sigma \), and \( \Sigma_i a_i x_{A_i} \geq x_S \).

Let \( X^+ \) denote the positive cone of \( X \), i.e.

\[
X^+ = \{ x \in X \mid x \geq 0 \}.
\]

Then \( p \) is a super-additive positive-homogeneous functional on \( X^+ \). We shall prove the existence of a linear functional \( F \) on \( X \) for which \( F(x) \geq p(x) \) when \( x \in X^+ \), and \( F(x_S) = v(S) \). Naturally, the set function induced by \( F \) on \( \Sigma \) is in the core of the game. The idea behind the proof is closely related to the Hahn-Banach theorem. (See, for instance, [1]).

Let \( Y \) be a subspace of \( X \) containing \( x_S \), and let \( Y^+ = Y \cap X^+ \). Assume that a linear functional \( F \) is defined on \( Y \) for which \( F(x) \geq p(x) \) when \( x \in Y^+ \), and \( F(x_S) = v(S) \). If \( Y \not= X \), there is a set \( A \) in \( \Sigma \) such that \( x_A \not\in Y \). Define \( Z = \text{span}(Y \cup \{x_A\}) \). Every vector in \( Z \) has a unique representation in the form \( y + ax_A \) with \( y \in Y \). For any real \( c \) the function \( G \) defined on \( Z \) by the equation \( G(y + ax_A) = F(y) + ac \) is a proper extension of \( F \). It remains to show that \( c \) may be chosen so that \( G(y + ax_A) \geq p(y + ax_A) \) when \( y + ax_A \geq 0 \). Because of the positive-homogeneity of \( p \), it is sufficient to prove the

\[\text{****} \quad \text{A functional } p \text{ is called super-additive if } p(x+y) \geq p(x) + p(y). \text{ It is called positive-homogeneous if } ap(x) = p(ax) \text{ when } a \geq 0.\]
existence of $c$, such that for any $y, z$ in $Y$, $y + x_A \geq 0$ and $z - x_A \geq 0$ imply $F(y) + c \geq p(y + x_A)$ and $F(z) - c \geq p(z - x_A)$. The last two inequalities are equivalent to

$$F(z) - p(z - x_A) \geq c \geq p(y + x_A) - F(y).$$

So it is sufficient to prove:

$$F(z) - p(z - x_A) \geq p(y + x_A) - F(y)$$

or,

$$F(z) + F(y) \geq p(z - x_A) + p(y + x_A).$$

But $y + x_A \geq 0$ and $z - x_A \geq 0$ imply $y + z \in Y^+$, so

$$p(z - x_A) + p(y + x_A) \geq p(z + y) \leq F(z + y) = F(z) + F(y)$$

and the desired inequality is proved. The proof is completed by a standard use of Zorn's lemma. Q.E.D.

Next we deal with the problem of existence of a $\sigma$-additive outcome in the core, assuming that $\Sigma$ is a $\sigma$-field.

A necessary and sufficient condition for an additive set function $\lambda$ to be $\sigma$-additive is that $\lambda(A_i) - \lambda(S)$ for any monotone increasing sequence $\{A_i\}_{i=1}^\infty$ in $\Sigma$ with $\bigcup_{i=1}^\infty A_i = S$.

If for every such sequence $v(A_i) - v(S)$ and $\lambda$ is in the core, i.e., $\lambda(A) - v(A)$ $A \in \Sigma$, we can easily conclude the desired condition $\lambda(A_i) - v(S) = \lambda(S)$. So we have proved:
Lemma A  If \( v(A_i) = v(S) \) for any monotone increasing sequence \( \{A_i\}_{1=1}^{\infty} \) in \( \Sigma \), the union of which is \( S \), then every outcome in the core is \( \sigma \)-additive.

Indeed we know a little bit more. If \( \lambda \) belongs to the core, then \( \lambda(A) \geq p(A), A \in \Gamma \) and we get a somewhat stronger result:

Lemma B  If \( p(A_i) = p(S) \) for any monotone increasing sequence \( \{A_i\}_{1=1}^{\infty} \) in \( \Sigma \), the union of which is \( S \), then every outcome in the core is \( \sigma \)-additive.

Of course the second condition is not necessary for the existence of a \( \sigma \)-additive outcome in the core. For example let:

\[
v(A) = \begin{cases} 
1 & A = S \\
0 & \text{otherwise}
\end{cases}
\]

So two open questions may be asked: Is the condition of lemma B necessary that every outcome in the core should be \( \sigma \)-additive? and what is a necessary and sufficient condition for the existence of a \( \sigma \)-additive outcome in the core? (Assuming the core is non-empty).

The treatment of another problem was found to be more successful. Assume a game \([S, \Sigma, v]\) and an additive function \( \mu \) on \( \Sigma \). What is the "continuity" condition on \( v \) with respect to \( \mu \), such that every outcome in the core will be "continuous" with respect to \( \mu \)?
If \( v(S \setminus A) = v(S) \) then for each \( \lambda \) in the core
\[ \lambda(A) = 0; \quad \text{otherwise} \]
\[ v(S) = v(S \setminus A) \cdot \lambda(S \setminus A) = \lambda(S) - \lambda(A) < \lambda(S) = v(S), \]
a contradiction. On the other hand, if \( \lambda \) is in the core
and \( \lambda(A) = 0 \), then \( v(A) = 0 \). We can state this result as follows:

**Lemma C**  
(i) If \( v(S \setminus A) = v(S) \) for every \( \mu \)-null set \( A \), then any outcome in the core vanishes on the \( \mu \)-null sets.

(ii) If an outcome in the core vanishes on \( \mu \)-null sets, then \( v \) does the same.

Another similar simple result is given below:

**Lemma D**  
If \( v \) fulfills the conditions of lemma B and lemma C (i), then any outcome in the core is absolutely continuous w.r.t. \( \mu \).
REFERENCES

A cooperative game with side payments with an arbitrary set of players is formulated. The notions of balancedness and core remain unchanged in this general game. L.S. Shapley invented the two notions above, and proved that the core is non-empty if and only if the game is balanced. In this memorandum the same result is proved for a game with an arbitrary set of players.
### INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.

2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. **AUTHOR(S):** Enter the name(s) of authors as shown on the report. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. **REPORT DATE:** Enter the complete date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.

7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.

8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, e, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

   (1) "Qualified requesters may obtain copies of this report from DDC."

   (2) "Foreign announcement and dissemination of this report by DDC is not authorized."

   (3) "U.S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through"

   (4) "U.S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through"

   (5) "All distribution of this report is controlled. Qualified DDC users shall request through"

   If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.

12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.

13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall and with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, roles, and weights is optional.
