Part I: SIGNIFICANT ORGANIZATIONAL ACTIVITIES

1. Unit Employment

   a. Assignment: Located at same base camp as previously reported and Commanded by LTC Marvin V. Rees.

   b. Mission: Our construction mission has been extended to include not only our area of responsibility in the Long Binh Area and Saigon Military District, but also Long Thanh (and Nhon Tranh).
c. Attachments or Detachments: On 16 January 1967 the 551st Engineer Detachment (all drilling) arrived in Long Binh from Fort Belvoir, Va., and was attached to this battalion by General Order No. 4, Headquarters, 159th Engineer Group. Unit is organized under RQ 5-550 C, Task Gil with authorized strength of 2 BN. Their equipment should arrive in country in February.

d. Unit Operations: All unit activities are described in the functional activities and projects described below.

e. Movements: On 16 December 1966, the Earth-moving Platoon of Co B, with two DT sections from the 43d Eng Co (DT) was ordered to Bear Cat in support of the 15th Engineer Battalion (Combat) horizontal construction effort. The areas were to be prepared immediately for 9th Div troop cantonments since elements of the Division were to arrive in country within two weeks. On 9 January 1967, an additional pit with an additional 2 DT sections from the 43d Eng Co (DT) were sent to Bear Cat. At this time the 169th BN had been assigned the vertical as well as the horizontal construction effort for the complete post. Two additional pits are working in support of construction effort, but commute daily.

2. Functional Activities:

a. Organization: No T0KE changes, and no personnel augmentations have been made or requested during this period.

b. Personnel Strengths:

- Average Daily Assigned Strength: 220 Officers, 662 EM
- Average Daily Present for Duty: 662 Officers, 40 EM
- Average Daily Work Force: 101 EM
- Average Daily Security Requirements: 51 EM
- Average Daily Incl Overhead: 401 EM

c. Morale and Welfare: Troop and officer morale remain high and all actions relating to troop welfare were expedited.

d. Administration: Normal Operation.

e. Intelligence and Security: Cantonment and bridge reconnaissance in selected areas were performed as engineering assistance to combat support units. Security was normal (without incident) during reporting period.

f. Operations and Training: Operations were conducted on a 10 hour shift on a 7 day basis, (which includes training of Landstory B & USAV subjects during a two hour period per week on Sundays). Our pneuprime (dust control), quarry, crusher and laterite pits were operated on a two shift basis.

g. Logistics: The logistics activities in the battalion have been overall satisfactory during the period. The battalion provided assistance and support to the 62d Engineer Battalion, that was restationed from Phan Rang, in moving equipment and supplies from the Saigon Fort to the Long Binh Area. BN S-4 is supporting the 62d EBG on supplies for their BN Cantonment area and their projects. BN messhalls provided messing facilities for the 62d EBG personnel and units provided equipment in support of their construction effort.
h. Labor: Approximately 290 Vietnamese laborers were utilized daily on various battalion projects except on Sundays. Vietnamese trucks were utilized to haul laterite, but the BN Commander requested cancellation of contracts since the trucks delivered on average of 1-1/4 loads per day. The VN drivers were being paid on a full day basis and not by the load which would be in benefit to the US Government.

i. Maintenance: The average maintenance deadline rate for ordnance equipment was 2.0% and the average deadline rate for engineer equipment was 4.8%. This reflects a vigorous maintenance program that is strictly enforced. The unit presently has 283 m for ordnance and 250 m for engineer items. No unusual problems have been encountered in the maintenance area.

j. Medical and Dental: No significant medical or dental events. General health of the Command is excellent. The BN experienced two deaths due to accidental causes. One EM was slightly wounded by a command detonated claymore mine.

k. Communications: In general, no problems were encountered with wire communications. Radio has been limited during this period, but due to our expansion of areas of responsibility greater use of radio communications is now required. BN is endeavoring to obtain newer more powerful units to replace existing radios due to their range limitations.

l. Water Supply: The 169th Engineer Battalion water point produces an average of 74,000 gallons of potable water daily for units in the Long Binh area. No unusual problems have been encountered.

m. Relationship with Installation: Very good due to our all out construction effort and helping hand assistance as our construction schedules permit. The BN has worked out a night utilization schedule of TO&E equipment in assisting units in need of self help support for development of their cantonment areas.

n. Civic Action: The 169th Engineer Battalion has been actively engaged in the Civic Action program. It has assisted the Vien Giac School by hauling laterite for the school area. This will provide better drainage and possible area for expansion. In the month of November, construction continued on the schools at Vien Giac and Bui Thai. A portable generator was purchased for the refugee parish of Dr Minh to provide a source of electricity. Approximately 10 loads of laterite for fill and sub-flooring were hauled to schools by the 43d Engr Co (DT). The Bui Thai school was opened and dedicated on 8 Dec 66 with a ceremony attended by Group and Battalion personnel. English classes were initiated at Dr Minh and Vien Giac schools on Sunday mornings. The instructors are volunteers from BN Hqs and H/H CO EM. Approximately 70 Vietnamese attend these English classes. On Christmas Day the Trn Mai Orphanage was treated to a Christmas party and dinner in the BN area as well as at the orphanage. Clothing, toys and candy were distributed to 100 children. The older children were taken to company mess halls for dinner. The Vien Giac school was dedicated on 26 January 1967 with a contest held in honor of the occasion. English classes are being continued in both schools.
o. **Inspection:** The annual General Inspection for FY 67 for the 169th Engineer Battalion was conducted on 24 to 26 January with an exit briefing on 28 January 1967. The AGI Team consisted of six officers and nine noncommissioned officers. In addition, the USARV (P) IG and a USARV IG in training inspection team were present during the inspection. The battalion received a rating of excellent. The detailed report has not been received as of this reporting period.

p. **Command Management:** Due to the amount of personnel actions concerning extensions, transfers, reenlistments, court martial, article 15’s, appeals, etc., a close system of control has been initiated in this headquarters by use of log books. These logs are used to control flow, suspense dates, and location of paperwork. This has reduced the number of misplaced documents and provides the commander with an instant reference on personnel action status.

q. **Force Development:** None during this period.
FOR OFFICIAL USE ONLY

3. Significant Unit Activities:

a. A Company

(1) During the reporting period another rock crusher was assigned to A Co bringing the total to two on hand. The quarry continued to operate on two ten hour shifts with quarry blasting scheduled every other day. This quarry supports the A Co crushers and also the crusher of the 16th Engineer Battalion. It also provides quarry rock for self help construction to all units in the Long Binh Sub Area.

(2) Korean rock unloading: The company was assigned the responsibility for unloading Korean rock at the Thu Aic barge site. The rock was delivered initially in sampans and finally in flat bottom barges. Unloading of the barges was accomplished using a 40 ton crane and two cubic yard clam shell. To completely clean the barge, the clam shell was lowered in the barge, it was closed and the remaining rock was shoveled by hand into the clam shell. Initially sampans were unloaded as much as possible with a 3/4 cubic yard clam: but the sampans were too small to allow complete unloading. The sampans were then moved to two conveyors placed on the edge of the river. The remainder of the rock was then unloaded on the conveyors by Vietnamese labor and dumped into a truck.

(3) This unit continues to apply peneprime on a two ten hour shift basis. Tactile areas that have been peneprimed or are being peneprimed are the Hao Hai Class II & IV Storage area, 9th Division cantonment area at Long Than, and all roads and areas in the Long Binh Sub Area. This operation is the most effective means of controlling dust in the Long Binh Sub Area.

b. B Company

(1) 784 Man Cantonment Area (Project Directive 66-170DC-159): During this period, the company has completed construction of this cantonment area. This includes completion of a 40x150' mess hall, one water tower (4,200 gallon tank capacity), one 20'x100' battalion headquarters buildings, and pouring the remaining concrete slabs for small huts. A total of 500,000 sq ft of operational hardstand (laterite) was also constructed by the Earth Loving Platoon, with necessary drainage.

(2) Class II & IV Storage Yard (Project Directive (66-185DC-159): During this period, the company has completed construction of 165,000 sq yards of laterite hardstand to be used as storage pads for Class II and IV supplies. Accompanying drainage facilities, in particular, scraper cut ditches were installed as well. The laterite pads were treated with peneprime.

(3) Radio Receiver Site (Project Directive 65-59DC-159, change 1): During this period, the company began and completed construction of this project. An area 500 meters by 700 meters was cleared. A laterite road, 24 ft wide and 350 ft long was constructed out of compacted laterite In addition, a 150 ft square elevated laterite hardstand was constructed at the end of the access road.

(4) Concrete Batch Plant (GP task assignment 159-47): During this period, the company completed this project. Included was the construction of a timber tower to support an aggregate and sand bin made
of welded steel. Volumetric measuring buckets were also constructed and placed for cutting. A timber pad was built to support the 34" concrete mixer. Accompanying earthwork, to include 550 ft of laterite road, was also accomplished.

During this period, the company constructed approximately 8,000 ft of triple concertina fence and 9,8000 ft of standard barbed wire fence (5 ft) using "H" type pickets. This project was later transferred to another unit.

(6) Rehabilitation of U3: RV Bn (Op Task assignment (159-55)

During this period the company installed a total of 74 timber columns in the U3: RV Bn building to reinforce the existing upper structure which was failing. This involved columns constructed of: 12x12, 8x12 timber, and 8x8 timber. 6,150 US man hours were expended.

(7) Sign Box Communications 3ld- (Project Directive 66-1220-159)

During this period the company continued work on the communications building. Interior partitions and doors were installed, a water tower (500 gallon tank) with accompanying plumbing was installed. Interior walls were lined with plywood as well. A 20x30 concrete pad to support the control ventilation system was also constructed. Final completion is on arrival of air conditioning unit.

(8) Task assignments

During this period the company worked on task assignments in addition to the above projects. These included: Installation of 169th Engr 9p air conditioning and wiring (159-91); construction of 169th Engr Bn (Bn) Dispensary Bunker (169-22); and construction of 169th Engr Bn Electrical Shop (169-23).

C. Company

(1) 169th Engr Bn Cpl Task Assignment 4159-49: The F B yard requires (35 VN and 55%) to operate the yard efficiently. The VN are used as supervisors and Dewalt saw operators. The yard was originally set up to prefab pr latrines and showers. At the present time it is used for prefading structure members and sections which are utilized in the vertical construction effort of the battalion. During this period 9 latrines and 2 showers have been constructed. (Our 2-story huts are precut and the roof trusses assembled. Fifty marshall tables were constructed for the Engineer Command. Twenty 4'x8' movable partitions on 1'x6' legs were constructed for 100 Company 169th Engr Bn. A 40x60' battalion carpenter shed was constructed in the prefab yard. At the present time girts and studs are being precut and trusses were handcrafted for 30 marshalls (20x100') to be erected at Long Thau by 3 Co, 169th Engr Bn. To date 200 trusses have been presifted and 325 studs and 70 gorts have been precut.

(2) Quarry Road, (Bn Task assignment 169-12). Installed a bank of 6 inch 18" culverts 30' on an existing road which is 160 meters long. The road bed was raised 5' from existing level.
(3) PX Housing and Operations Building, (2p Task Assignment (159-53)). Construction of 10x50' tropical wood frame building with a concrete floor was used instead of concrete because this is a temporary building. The floor consisted of l6x1 joints and l6' flooring. A trikin section fence was erected around the perimeter (500 meters) to provide protection against pilleros.

(4) Two Story Hutments, (2p Task Assignment 159-43). The building which was constructed for C Company of the battalion as a model for other two story hutments to be erected in the future in the Khe An and Long Binh Sub Area. Prefab kits will be assembled with instruction, so as to assist non-engineer units in their constructions. The ground floor is constructed of 2"x10" joints with 2"x10" bridging.

(5) Killard, 500 man cantonment area, (Project Directive 66-20'DC-159) and constructed for 2/34, Armor and 5/2 int. Project was started on 7 Oct 66. EDC is 14 March 67. The following items have been constructed:

1. Roads 30' - 3,200 linear yards
2. Link Trails - 2,100 Linear yards
3. Hardstands - 86,000 sq vds
4. Buildings - 32,000 sq ft (Concrete)
   a. 20x150 messhall w/30x60 scullery - 1 st.
   b. 40x50 messhall w/20x70 scullery - 1 st.
   c. 16x26 latrine - 9 st.
   d. 16x26 shower - 8 st.
   e. 20x50 cmd - 1 st.
   f. 20x100 cmd - 1 st.
   g. 20x100 disp - 1 st.
   h. 20x100 admin - 2 st.
   i. 20x100 s-4 - 2 st.

All buildings are tropical wood frame construction.

D Company

1. 24th Evacuation Hospital (Project Directive 66-219-159): The 30B of 15 Dec 66 was not for the hospital. It that time the Administration Bldg., two 10B Bldgs., five Ward Bldgs., three Nurses' Quarters Bldgs., the Mess Hall, the showers, the latrines, the laundry, and the initial seven air conditioned Hospital Bldgs. were turned over to the hospital for use. At the present time, work is nearing completion on the remaining Wards, Transformers and Lounges, as well as the seven remaining Ward, the personnel building, dental building and the pharmacy. Construction is proceeding rapidly on the Supply Bldg., PX, Nurses' Bldg., and the Classroom Bldg. Work on the power system and water distribution system is underway at present. The roads in the hospital have been paved and the drainage system is essentially completed. Work has begun on sidewalks.

2. Non-Potable Water Storage Facilities - Long Thanh (Project Directive 66-219-159): four lift pumps were installed on two existing wells within the cantonment area at Long Thanh. Two 5500 gallon storage tanks were designed and constructed by a unit and an access road was constructed at well site #1. The project was completed on 20 Nov 66.

3. Water Well Facility - Long Thanh (Project Directive 66-219-159): This project included building a pump house, installing a hydrochlorinator, assembling and erecting a 21,000 gallon water tank and tower, constructing three fill stands with six discharge points and laying pipeline to connect the various components of the system. The system is presently in
(4) The company built a timber pile driving and construct site at the Thu Duc Bridge. Construction was completed and constructed at the Thu Duc Bridge site in just 15 days. The project involved driving 55 timber piles and putting a superstructure capable of supporting a Class 70 loads on them. The facility has been operational since 11 Dec 66 and has materially aided rock unloading operations at the site.

(5) After "All Activity - Bien Hoa" (Project Directive 07-990-017-4): Construction was recently completed on a utility facility in Bien Hoa which will serve the Engineer Command and units of the 173rd Airborne Brigade. It includes a camp house with hydrochlorinators, a 21,000 gallon water tank and tower, 1,000 feet of 4" pipe and three fill points with 5 discharge points as well as two access roads.

(6) L311 Asphalt Paving (Project Assignment 159-39); it present 53,800 SY of asphalt pavement have been laid within the Lone Pine area. Expect to have this year approx 52 miles of road in this area.

a. 43rd Engineer Company (D7)

(1) Support to Ty Ninh: On 17th or 18th Dec 66, Ten (10) trucks were utilized on a trip to the 7th Division area. Crushed rock was also delivered to the Phu Linh Civic Action Group at Ty Ninh.

(2) On 21 January 1967 a detachment from the company left Long Binh, Vietnam enroute to My Tho, Vietnam. Twelve trucks and fourteen men were in the detachment. The detachment was attached to the 617 Engineer Company (F3), commanded by CPT Vernon. On the first day the convoy Long Binh at 1400 hours and arrived at New Port Compound, at 0600 hours the following morning, the convoy left New Port Compound enroute to My Tho, Vietnam. Arriving at My Tho at 1300 hours on the 2nd of January 1967. On the 31st of January 1967 the detachment left My Tho in convoy at 0900 hrs and arrived at Long Binh at 1200 hrs the same day, at which time the trucks were released and returned to the 43rd Engineer Company (D7) motor pool.

b. For official use only

(3) Support of the 26th Engineer Division at Binh Chinh on 20 November 1966, hauling lumber, 39, 2 and laterite. The project was completed on 19 December 1966. Ten trucks and drivers were utilized per day. The trip was made per day.

(4) The company has been hauling in support of the 159th Engineer Battalion and the 66th Engineer Battalion since their arrival in Vietnam. Projects that have been supported are: the Class II 77 storage yard at Ho Hai, the Hano Cantonment area, Long Binh Ammunition Depot, Tan Son Nhat Air Base and numerous other similar projects.
Section 2 Part I: Operations (Lessons Learned):

1. Logistics

   a. Item: Transportation of 60' Piles

      b. Discussion: This unit was given a task assignment to construct a
         finger pier at Thu Duc. The pier called for 12 of 40' piles and 36 of 60' piles.
         The problem was to move the 60' piles from FIDC Construction Interim Yard #206
         down Highway 1 and Highway 1A to the construction site at Thu Duc Island; a dis-
         tance of about 8 miles. The longest carriers in the battalion are 22' low bed
         trailers. The pipe trailers belonging to the Engineer Pipe Line Co and the pole
         trailers of the Signal Construction Battalion are not long enough to handle 60'
         piles.

      c. Observation: Two solutions were arrived at and used

         (1) A 2' high stack of dunnage lumber was placed across the end of
             a standard low bed trailer. Then seven 60' piles were laid on the low bed trailer,
             butt end forward. The piles were chained in three places to the low bed trailer.
             The tip ends were bound with an additional chain. The piles were carried at a
             speed of 5-10 mph to the job site. A safety vehicle followed the trailer.

         (2) A commercial logging truck, under contract to the 4th Transportation Terminal Command, Saigon, was available for hauling on the second day. The
             required number of piles were moved to the project site. From a safety point of
             view, the first solution is a marginal method for moving these piles. Lists of
             available carriers having special equipment for over-length, over weight or over
             sized loads should be on hand at depot yards for customer information.

   f. Item: Resupply of Detonating Cord

      b. Discussion: A Co, 169th Engr Bn, operates a quarry in the Long
         Binh area. An average of 15,000 feet of Detonating Cord, Reinforced, FSN 1375-
         204-6851, DOD/C M456 is used per month in the quarry. Our direct support unit
         for this item is the 3rd Ord Bn. Due to the speed at which detonating cord is
         consumed, due outs are not established by 3rd Ord Bn stock control. Thus a unit
         is likely to receive an issue, only if it has a representative standing by when
         a shipment arrives at the depot. By finding out when the next shipment was due
         in and having a supply representative there at that time was the only method
         whereby the monthly supply of detonating cord could be obtained.

      c. Observation: This poor supply procedure causes needless travel
         and waiting, resulting in unnecessary expenditure of man-hours. It also forces
         the using unit to conform to the schedule of the service unit instead of being
         able to pick up supplies when time and its mission permit.

2. Communications

   f. Item: Radio Communication in a Construction Engineer Battalion

      b. Discussion: The AN/GRC-19 is a main element of the radio communi-
         cation network of a construction engineer battalion. The T-195/GRC is the
         transmitter for this radio and has proven very difficult to keep operational.
         The air filters on the T-195 require cleaning at least twice a day and even so,
         the dynamos and blower motors keep burning out.
FOR OFFICIAL USE ONLY

c. Observation: The mission of the construction engineers in Vietnam demands a flexible, responsive radio communication system. The outdated radio equipment that this unit is operating with should be replaced by the new series radio sets.

3. Maintenance

b. Item: Tractor Wheeled Industrial FSN 2420-088-9384

b. Discussion: This unit was issued 22 en tractors during the month of January. Unit pick up at Saigon Port was arranged. Some of the problems encountered by personnel taking pick up these tractors were: Fan belt tension was released in an improper manner. On several of the tractors, fan adjusting screws had been backed completely out of the fan bracket support and an attempt made to drive the bracket downward with a hammer without loosening the bracket. This action required parts to be made before operating the tractors. Seats, fire extinguishers, etc., were packed in the overpack kits. This required the kits to be opened in order to get the tractors operational. The boxes containing the overpack kits are not easily closed and once they are opened the contents which include publications, filters, etc., are exposed to the weather and will deteriorate.

c. Observation: Due to the crowded condition of Saigon Port and the need for items of equipment to be made operational in as little time as possible, equipment should be shipped as near ready for operation as possible. OEM could be mounted and protected by a plastic covering. Mechanical adjustments should be made prior to shipment which will allow machinery to be placed in a limited operational condition as soon as possible after unloading.

b. Item: Tractor Full Tracked D7E FSN 2410

b. Discussion: This unit has received 13 of Model D7E tractors during the past three months. All 13 tractors were received with puller type fans installed. Conditions in Vietnam do not allow use of the puller fans mainly due to operator discomfort. Pusher fans are available and shipped with the tractors. To install the pusher fan required the expenditure of 12-24 mechanic hours at unit level.

c. Observation: Pusher fans should be installed prior to shipment of tractors in Vietnam. The use of cold weather equipment is not required in Vietnam.

c. Item: Repair parts for special purpose equipment

b. Discussion: Repair parts for low density high usage engineer equipment i.e. rock crushers, earth augers, asphalt distributors, etc., continues to be a problem. Many of the parts required are not stocked in support units and spots in Vietnam. This causes long down time and loss of considerable construction effort due to lack of relatively minor parts such as clutches, bearings, special bolts, drive bolts, etc. This unit requested repair parts of this nature more than three times per item, to include follow up action to no avail.

c. Observation: More emphasis should be placed on recording fringe around and an attempt made to stock these repair parts rather then relying on only those items listed as stockage items in 35P manuals.

FOR OFFICIAL USE ONLY
Section 2. Unit Observations (Lessons Learned)

3. Unit Lessons Learned

   a. Item: Operations—Hydraulic Swivel Guard

   b. Discussion: The hydraulic swivel connection on the bucket of the H90CM scoop loader is unprotected. Operation around large rock would sometimes cause the rock to strike the connection, causing failure. To prevent this, a guard was fabricated from ¼ inch plate - 6 inches wide and 2 ft 2 inches long. This plate was then bent in a U-shape to fit from the scoop runner or skid up to the clam activating cylinder mounting bracket.

   c. Observation: The incident of hydraulic connection failure was greatly reduced by the innovation.

   a. Item: Operations - Brake adjusting tool

   b. Discussion: In order to make it easier to adjust the brakes on a Huber Warco model 4D, a special tool was fabricated from 2½ feet of steel stock for the body. The adjusting end was a 2½ inch flat steel, 3/4 inch wide. This was welded on the body of the tool along with a handle. A sketch of the tool is enclosed.

   c. Observation: The use of this tool will save almost 45 minutes work.

   a. Item: Operations - Unloading of rock from barges

   b. Discussion: Tests were made on different methods of unloading rock from small barges or sampans. Test methods included the use of full and half 33EX's, 5 ton dump beds and fifty five gallon drums.

   c. Observation: Results of the study were forwarded under separate cover.

   a. Item: Use of Grubbing Plows

   b. Discussion: The grubbing plow, a crawler tractor attachment with large teeth resembling those of a pitch fork, is a valuable piece of equipment for clearing operations. This type of plow enables the operator to grub out roots from the ground and push the roots and other vegetation into piles without stockpiling dirt in front of the blade. The dirt simply passes between the teeth of the plow. By eliminating the stockpiling of dirt along with grubbed vegetation, the piles can be completely and effectively burned. This reduces the size of the piles as well, enabling the dozer to operate more efficiently since it would only push vegetation and not dirt.

   c. Observation: Recommend that the US army issue to its construction units in Vietnam this type of plow. The grubbing plow has proven to be an invaluable piece of equipment in Vietnam. It is currently a standard piece of equipment on all clearing and grubbing operations conducted by ARVN-BuJ civilian contractors.
a. Item: Two Story Hutment

b. Discussion: Present plans call for bridging between floor joists. Bridging and joists are of the same material. It is very time consuming to cut 375 individual pieces for bridging and place them. At the present there is a severe shortage of 2" x 10" and 2" x 12" lumber.

c. Observation: Diagonal bracing (1 x 4) in lieu of 2x10 or 2x12 bridging would conserve lumber which is in short supply. This will not reduce the design strength of the ceiling. Ends of joists should be boxed in with 1" material.

b. Item: Standard Tropical Buildings

b. Discussion: Problems arise with the ventilator on the peak of the roof. When it rains there are accompanying winds. These winds cause water to blow under the ventilator.

c. Observation: Advantages of the vent are countered by the water problem. The alternative is either to delete the roof ventilator or raise the pitch of the roof.

b. Item: Trash being pulled into MD-16 dozer engine compartment

b. Discussion: As trash is pulled into the engine compartment it tends to build up in the under pad cover. The heat from the engine ignites this trash which then burns the electrical system of the engine.

c. Observation: This unit lost two days work due to this hazard. The fire caused severe damage to the hydraulic hoses and electrical systems. It is recommended that screens be placed on engine ventilator compartments and over the access hole to the radiator cap on these reactors.

b. Item: Bolts on 5 Ton Dump Trucks

b. Discussion: Due to the rugged terrain in Vietnam, it has been noted that all bolts on the 5 Ton Dump Trucks become loose and eventually are lost without a very rigorous and well supervised maintenance program.

c. Observation: The 43d Engr Co (DT) placed its forty-eight dump trucks into six truck sections, assigning one mechanic to a section. This has given a closer driver-mechanic relationship. It affords more attention per truck and provides the mechanic with a working knowledge of each truck. This is evident by the low deadline rate of 4.2% in the company.

a. Item: Safety

b. Discussion: Safety is a major problem encountered by a driver with road conditions and terrain in Vietnam.
Observation: The 43d Eng Co (DT) instituted a safety patrol within the company utilizing two jeeps with safety patrol markings. These jeeps are kept on the road to enforce speed limits, prevent tailgating, and enforce safe driving procedures. Through this and strict supervision by section MCO's the company has held accidents to a minimum.

a. Item A: Corrugated Tin Cutters

b. Discussion: In constructing tropical type buildings it was found to be rather difficult to cut corrugated tin roofing into desired lengths. Most roof vents on those type buildings make use of 4 foot lengths of tin, whereas the most common lengths of tin available in the supply yards are 6, 8, and 10 foot long. An oxyacetylene cutting torch was used to cut some pieces to correct length, but it was found that the galvanized coating on the tin caused damage to the tip on the torch. 600 foot sections available in the construction yards were found to be too light to cut the heavy gauge metal. SSG William H. Peck suggested making a large cutter similar to that used in cutting paper. SSG Peck fabricated the corrugated tin cutters in one afternoon. (See Incl #2.)

c. Observation: The corrugated tin cutters have proven invaluable in that they have speeded up construction on roof vents considerably and saved man-hours expended. Also, because of the ruggedness and durability of the cutter it has been found that local nationals can operate it without difficulty.

a. Item B: Use of crane with Extended Boom

b. Discussion: In recent construction at the 24th Evacuation Hospital a problem was encountered which required the use of a 20 ton truck mounted crane with an extended boom. The problem arose with the erection of a 40 foot prefabricated steel tower, on which had to be placed a 21,000 gallon water tank. Because of the weight of the tank and the height of lift required, it was decided to erect the tank in place on top of the tower. In order to handle the erection of the upper sections of the tower, as well as lifting components of the tank onto the completed tower, two 10 foot boom extension sections, with cable "eyes", were added to the normal 40 foot boom on our 20 ton truck crane to give a 60 foot boom with which to work. The crane with concrete bucket attachment was also utilized as an elevator for personnel and equipment to travel to the top of the tower.

c. Observation: The use of the crane with an extended boom proved to be the exact answer to the problem at hand. Careful handling of the piece of equipment by an experienced operator precluded any unusual problems arising. It should be stated, however, that the extra weight of the boom sections should be taken into account when calculating safe lifting capacity, as well as the fact that the lifting radius is greatly reduced for a crane with a boom of this length. If at all possible, cranes with extended booms should be operated in one location or one area only because traveling on the roads may damage the booms and cables. It also presents a greater hazard to power and telephone cables to maneuver at sharp corners or short radius turns.
a. Item C: Asphalt Sidewalks

b. Discussion: In recent work at the 21st Evacuation Hospital, the question of paving sidewalks has arisen. The following factors would seem to favor asphalt rather than concrete sidewalks. Extensive form work is required for concrete sidewalks; asphalt sidewalks can be laid by setting two string lines and laying a 2' x 4' next to these lines. Minimum thickness of concrete sidewalks should be three inches to avoid cracking caused by curing too rapidly; a 1/2 inch compacted thickness of asphalt is more than enough to meet foot traffic requirements (drive ways in the States are normally 2' thick). Concrete required personnel to place and finish it and is usually transported from a batch plant. Asphalt can be brought to the site in a 5 ton dump truck and hand tamped or rolled. Both asphalt and concrete result in acceptable surfaces if placed properly. Asphalt is less expensive per unit than concrete. Asphalt can be ready for traffic one hour after compaction.

c. Observation: In view of the above discussion, it is recommended that, where both asphalt and concrete are available, asphalt be used for sidewalk paving. Both surfaces use critical materials such as rock; the fact that about 1/4 the volume of asphalt is required as compared with concrete makes it much more economical. This plus the ease of forming for asphalt sidewalks, makes asphalt the more desirable of the two materials.

Part III, Recommendations

1. Operations: Air Conditioning: Construction requirements to include fabrication of duct work and installation has been placed on this Bn and other Construction Battalions in Vietnam. We do have two (2) "21J20 sheetmetal workers, but not skilled for engineering projects. The reason these two (2) 21J20 are assigned is strictly for 3d maintenance shop body repair and one in the utility section for installation and repair of sheetmetal equipment.

2. Air conditioning duct work requires a highly trained sheetmetal worker, whom has had many years of experience. The tools of the trade, such as a press, cutter, soldering equipment and clamps, are not organic TOE equipment. The only tools we are authorized is Tool kit, sheetmetal workers, hand, PSM 5160-596-1510, which do not include the tools to fabricate duct work, diffusers, and vents.

3. It is recommended that cutter, press, clamps, and soldering kit be made an organic part of our TOE Construction equipment along with qualified sheetmetal workers.

4. If TOE changes cannot be made, it is recommended that Sonac air duct or Harmon Nelson flexible duct be utilized. This type duct does not require any tools or skilled labor to install.
FOR OFFICIAL USE ONLY

EOB-3
1st Ind
CPT HARMON/rls/LB543
SUBJECT: Operational Report - Lessons Learned (RCS FOR-65) for Quarterly Period Ending 31 January 1967

DA, Headquarters, 159th Engineer Group (Const), APO 96491, 20 February 1967

TO: Commanding General, United States Army Engineer Command Vietnam (Prov)
ATTN: AVCC/RC, APO 96491

Assistant Chief of Staff for Force Development, Department of the Army (ACSFOR DA), Washington, D.C. 20310

1. This report is considered comprehensive and of value for documentation and review of the reporting units activities and experiences.

2. This Headquarters concurs with the Observations and Recommendations in Section 2, with the following comments:

   a. Item C. a. Radio Communication in a construction Engineer Battalion: The operation and maintenance of the outdated radio equipment throughout this Group has been a continual problem. In addition to the poor radio communications in general, there is the additional problem of insufficient FM radios to net with the newer model radios of other tactical units.

   b. Part III, Recommendations: The use of a prefabricated or flexible duct for air conditioning systems would be very advantageous in our construction. This solution should be investigated for general application.

AVCC-MHD (31 Jan 67)  2d Ind
SUBJECT: Operational Report-Lessons Learned (HCS CSPOR-65) for quarterly
        Period Ending 31 January 1967

HEADQUARTERS, UNITED STATES ARMY ENGINEER COMMAND
VIETNAM (PROV), APO 96491  16 MAR 1967

TO: Commanding General, United States Army, Vietnam, ATTN: AVHCC-DH,
    APO 96307

1. The subject report, submitted by the 169th Engineer Battalion (Const),
   has been reviewed by this headquarters and is considered adequate.

2. The recommendations and comments of the indorsing and submitting
   commanders have been reviewed and this headquarters concurs, subject to the
   following added comments:

   a. Section 1, paragraph 3b(7), air conditioning equipment has arrived
      in-country.

   b. Section 2, Part I, paragraph 1a, Item: Transportation of 60' Piles. This
      headquarters does not concur using unsafe field expedients when
      requests for special equipment can be made through local transportation
      offices.

   c. Section 2, Part I, paragraph 1a, Item: Resupply of Detonating Cord. Better
      forecasting of requirements are being established by the 1st
      Logistical Command.

   d. Section 2, Part I, paragraph 2a, Item: Radio Communication in
      a Construction Engineer Battalion and paragraph 2a, 1st Indorsement. The
      AN/GRC-19 radio is being replaced by the new AN/GRC-106 radio as they become
      available. An MTOE request to change all engineer battalions to the E series
      TOE has been submitted to higher headquarters. Upon approval all battalions
      will be authorized the new series of FM tactical radios.

   e. Section 2, Part I, paragraph 3a, Item: Tractor wheeled Industrial.
      A letter has been forwarded to CG, 1st Logistical Command concerning deficiencies
      found during deprocessing of the 290M tractor.

   f. Section 2, Part I, paragraph 3a, Item: Tractor Full Tracked D7E.
      Newer models have variable blades that can be adjusted without having to change
      the unit.

   g. Section 2, Part I, paragraph 3a, Item: Repair Parts for Special
      Purpose Equipment. A letter will be sent to the unit concerned, requesting
      specific information on repair parts required.
AVOC-MHD (31 Jan 67) 2d Ind
SUBJECT: Operational Report—Lessons Learned (nCS CSFOR-65) for Quarterly
Period Ending 31 January 1967

h. Section 2, Part I, paragraph 3a, Item: Use of Grubbing Plows. This headquarters will investigate and evaluate the use of these plows, and initiate procurement action if appropriate.

i. Section 2, Part I, paragraph 3a, Item: Standard Tropical Buildings. This headquarters has issued instructions to delete roof ventilators from all tropicalized wood buildings.

j. Section 2, Part II, (labelled "Part III"), and paragraph 2b, 1st Indorsement. This headquarters will study the proposal of the XTOE when submitted and justified by the unit. As an immediate solution this headquarters is currently redesigning the duct work required for air conditioning with emphasis on simplicity of construction. A program has also been initiated to train personnel in the fabrication and installation of this duct work.

FOR THE COMMANDER:

HICLACE J. DUCOTE
Colonel
Chief of Staff
SUBJECT: Operational Report—Lessons Learned for the Period Ending 31 January 1967 (RCS GSFOR-65)

HEADQUARTERS, UNITED STATES ARMY VIETNAM, APO San Francisco 96307

TO: Commander in Chief, United States Army, Pacific, ATTN: GFOP-CT APO 96558

1. This headquarters has reviewed the Operational Report—Lessons Learned for the period ending 31 January 1967 from Headquarters, 169th Engineer Battalion (Construction) as indorsed.

2. Pertinent comments follow:

   a. Reference Paragraph 1a, Page 9, and Paragraph 2b, 2d Indorsement, concerning transportation of 60' piles: Concur in the proposal to establish lists of materials handling and transport equipment capable of handling unusual loads or lengths of materials. A letter will be forwarded to 1st Logistical Command requesting that they compile lists of this type equipment at each of their depots for customer reference.

   b. Reference Paragraph 1b, Page 9, and Paragraph 2c, 2d Indorsement, concerning the short supply of detonating cord: Concur. Detonating cord has been in short supply for some time and extensive effort has been directed to this problem. As a means of improving the RVN stockage position, detonating cord has been placed under Available Supply Rate (ASR) control for a thirty-day period. Engineer units which use or have anticipated requirements for large quantities of detonating cord have been requested to provide a reasonable forecast of their 6-month requirements. This will assist the 1st Logistical Command in requisitioning and maintaining proper stock levels at desired locations.

   c. Reference Paragraph 1c, Page 9, and Paragraph 2d, 2d Indorsement, concerning the need for new series radios: The MTOE referred to in 2d Indorsement was forwarded by USARPAC to DA on 19 December 1966.

   d. Reference Paragraph 3, Page 10, and Paragraph 2e, 2d Indorsement, concerning wheeled tractors: Concur with action taken in 2d Indorsement.

   e. Reference Paragraph 3, Page 10, and Paragraph 2g, 2d Indorsement, concerning repair parts for special purpose equipment: Concur with proposed action in 2d Indorsement.
AVHEC-DH (31 Jan 67)

SUBJECT: Operational Report—Lessons Learned for the Period Ending
31 January 1967 (RCS CSFOR-65)

f. Reference Paragraph 3, Page 11, concerning hydraulic
swivel guard: Concur; however, if the improvement is considered fea-
sible for adoption on all H 90 CM scoop loaders, the unit is encouraged
to initiate a request for modification work order along with a sugges-
tion citing tangible or intangible benefits expected or derived from
the modification.

g. Reference Paragraph 3, Page 11, concerning the brake ad-
justing tool: Concur; however, the suitability of the fabricated tool
will be investigated by ANC technical representatives who will initiate
procurement action and issue maintenance instructions.

h. Reference Paragraph 3, Page 11, and Paragraph 2h, 2d In-
dorsement, concerning the use of grubbing plows: Concur in action pro-
posed in 2d Indorsement.

i. Reference Paragraph 3, Page 12, concerning hutment diagonal
bracing: Concur. The recommended use of 1" x 4" or any other small
dimension scrap lumber for floor joist bracing is considered desirable
in light of material economy and will in no way degrade the construction
standards of the hutment.

j. Reference Paragraph 3, Page 12, and Paragraph 2i, 2d In-
dorsement, concerning standard tropical buildings: Concur in 2d Indorse-
ment comment. Engineer Command has taken necessary action to eliminate
roof ventilators.

k. Reference Paragraph 3, Page 13, concerning the use of crane
with extended boom: Nonconcur. The concrete bucket attachment was de-
signed to move concrete or other similar material. The use of such
equipment or attachments thereto, for other than its intended purpose
is prohibited.

l. Reference Part III, Page 14, and Paragraph 2j, 2d Indorse-
ment: Concur with action taken and proposed by Headquarters, US Army
Engineer Command, in 2d Indorsement.
