SECTION 1Summary

Runs 428 through 431-SPL-S1 were special tests performed at MSTC Test Stand 1-95. The primary objective of Run 428 and 429 was to test the new fill provisions for the engine LO2 tank. Runs 430 and 431 had three objectives. They were: (a) to determine the effectiveness of the reworked fill ducting for the engine LO2 tank, (b) to further evaluate the LO2 Recirculator In (breakaway valve) temperature problem, and (c) to determine the adequacy of chilldown for the vernier engine LO2 ducting.

The engine LO2 tank fill times were well within the required 13 minutes for all four runs.

On Run 430, with LO2 ducting insulated, the maximum LO2 Recirculator In (breakaway valve) temperature reached during the warm interval after LO2 LOADING COMPLETE was -289 DGF at 13.2 minutes. On Run 431, with this insulation removed, the corresponding temperature was warmer than -287 DGF (upscale of recorder limit). The LO2 topping valve was full open (28 GPM) for both runs (430 and 431) during the 15 minute LO2 topping hold.

During both runs (430 and 431) visual observations verified that satisfactory Vernier Engine LO2 ducting chilldown was achieved.

During Run 428 the missile LO2 tank pressure exceeded redline (10 psig). The maximum pressure reached was 10.7 psig when emergency pressurization was initiated. After drain, inspection revealed valve L-26 closed. This valve is located in the sense line from the LO2 storage tank ullage to the tee of the pressure controller and instrumentation transducers. No damage resulted as a result of the incident.

Fuel and LO2 were satisfactorily loaded at IOC flow rates with the Acoustica Propellant Loading Control System properly controlling the loading sequences during Run 428 and 431. Run 428 was terminated manually at 8.70 minutes after Fuel Load Start because the objective of the test had been accomplished. During Run 430 the Acoustica LO2 90% level probe activated prematurely.

HE/LN2 loading was not included in the plan for these runs.

Missile tank pressures were maintained within the prescribed limits in all sequences during Runs 429, 430 and 431, as well as during Run 428 after the L-26 hand valve problem was eliminated (see LO2 Loading System discussion, Page 3).

The LO2 boiloff valve P/N 27-80588-811 operated satisfactorily during all four runs.

No missile or facility damage occurred during these runs.

This document contains information affecting the national defense of the United States within the meaning of the Espionage Laws, Title 18, USC, Sections 793 and 794. The transmission or the revelation of its contents in any manner to an unauthorized person is prohibited by law.

PAGE 2

SECTION 2

Engine LO2 Tank Fill and Vernier Chillover

Based on data accumulated during regular Phase III testing and in special tests following the conclusion of Block II, the engine LO2 plumbing configuration was changed to improve the Engine LO2 Tank fill time. The revised design is described in the Configuration portion of Appendix III, Test Article History, and is shown in the schematics of Figures 1 and 2. As shown in the fill time table below, the Engine LO2 Tank filled satisfactorily on all four runs.

Analysis of Engine LO2 tank pressure records and EA data from PL673X VERNIER LO2 TANK FULL (Engine LO2 Tank Full) during previous testing led to the conclusion that the fill time could be determined from the pressure records as clearly as from the sequence data. The LO2 detector probe for PL673X was removed from the system and fill times here were determined by pressure data analysis.

<u>Run No.</u>	<u>Fill Time (Minutes after FUEL LOAD START)</u>
428	7.7
429	7.6
430	8.2
431	8.2

Visual observation of vernier LO2 bleed verified that Vernier Engine LO2 plumbing chilled down in approximately 10.5 minutes after FUEL LOAD START.

This document contains information affecting the national defense of the United States within the meaning of the Espionage Laws, Title 18, USC, Sections 793 and 794. The transmission or the revelation of its contents in any manner to an unauthorized person is prohibited by law.

PAGE 3

SECTION 3

Overall Systems Performance

FUEL LOADING SYSTEM

Fuel Loading System operation for Runs 428, 429, 430 and 431 was satisfactory, with loading being terminated by the Acoustica 100% fuel level probe. The following data summarizes the Fuel Loading System for all four runs.

Fuel Loading Data

<u>Run No.</u>	<u>Termination Time (Minutes after fuel load start)</u>	<u>Total Weight (Pounds)</u>	<u>Maximum Flow Rate (GPM)</u>
428	6.44	77,250	4600
429	6.35	77,250	4600
430	6.71	77,150	4600
431	6.40	77,090	4600

LO2 LOADING SYSTEM

LO2 Loading System operation was satisfactory during Runs 428 and 429. However, prior to recycling the count during Run 428 the missile LO2 tank pressure exceeded the red line (10 psig) due to valve L-26 being closed. This valve is located in the sense line from the LO2 storage tank ullage to the tee of the pressure controller and instrumentation transducer. This prevented pressure sensing of the LO2 storage tank ullage to the pressure controller, the LO2 console and the instrumentation recorder.

Since no ullage pressure was sensed by the pressure controller, the LO2 storage tank was pressurized above normal (normal pressure during cooldown is 15 to 30 psig). This caused an excessive LO2 flow rate into the missile. The boiloff valve could not relieve the excess pressure caused by the boiling liquid; consequently, the ullage pressure in the missile LO2 tank rose above red line. Emergency pressurization was initiated and manual detanking was performed with no further incident. See Missile Pressurization System discussion for further details resulting from this problem.

After recycling the count for Run 428, and allowing time for the propulsion LO2 system to return to ambient temperature, the weight of LO2 loaded was 173,490 pounds with loading being terminated by the Acoustica 90% LO2 level probe at 11.59 minutes. LO2 loading was terminated manually during Run 429 at 8.67 minutes with 102,360 pounds of LO2 aboard (58.5% LO2 level).

This document contains information affecting the national defense of the United States within the meaning of the Espionage Laws, Title 18, USC, Sections 793 and 794. The transmission or the revelation of its contents in any manner to an unauthorized person is prohibited by law.

CONVAIR ASTRONAUTICS

PAGE 4

The LO2 Loading System operation was satisfactory during Run 430 and 431. However, during Run 430 the Acoustica 90% LO2 level probe prematurely signalled LO2 rapid load valve close at the 66.9% LO2 level. The LO2 console operator initiated LO2 rapid load valve open 0.22 minutes later and closed it when the LO2 tank head pressure (U1901V) read 89.0% LO2 level. LO2 loading was terminated automatically by the 99% LO2 level probe during Runs 430 and 431 at 11.81 and 11.57 minutes respectively. The weight of LO2 loaded was 172,080 pounds with a maximum LO2 flow rate of 5750 GPM for both runs.

The performance of the LO2 Topping System was satisfactory with the LO2 topping valve full open throughout both Runs 428 and 429. The maximum flow rate with the LO2 topping valve full open is 28 GPM.

The LO2 Recirculator In temperature (P1925T) remained below -291 DGF for Run 428 during LO2 loading and increased to -282.5 DGF during the 1.17 minute LO2 topping hold. The maximum temperature reached was -281 DGF before drain start. This temperature (P1925T) remained colder than -291 DGF for Run 429 during loading. There was no topping hold as LO2 loading was terminated at the 58.5% LO2 level. See Figure 5 for details of LO2 Recirculator In temperature (P1925T) during Run 428.

The LO2 Topping System operation was satisfactory during Run 430 and 431 with the LO2 topping valve full open throughout both runs (28 GPM maximum flow). The airborne fill and drain valve and the LO2 manifold, including the portion of the manifold inside the thrust barrel up to the pump inlets, were insulated prior to Run 430. The LO2 Recirculator In temperature (P1925T) for Run 430 remained below -291 DGF throughout LO2 loading and the 15 minute LO2 topping except between 12.1 and 13.5 minutes. The maximum temperature reached was -289 DGF.

The portion of insulation inside the thrust barrel up to the pump inlets was removed prior to Run 431. The LO2 Recirculator In temperature (P1925T) for Run 431 remained below -291 DGF throughout LO2 loading and the 15 minute LO2 topping hold except between 10.1 and 14.0 minutes. The maximum temperature reached cannot be determined because the temperature exceeded the upper recorder limit of -287 DGF. See Figure 6 for details of the LO2 Recirculator In temperature (P1925T) during Runs 430 and 431.

GO2 sampling was not used for Runs 428, 429, 430 and 431.

HELIUM/LN2 LOADING SYSTEM

Helium/LN2 loading was not planned for Runs 428, 429, 430 and 431.

This document contains information affecting the national defense of the United States within the meaning of the Espionage Laws, Title 18, USC, Sections 793 and 794. The transmission or the revelation of its contents in any manner to an unauthorized person is prohibited by law.

PAGE 5

CONVAIR PROPELLANT LOADING CONTROL SYSTEM

The Convair Propellant Utilization System was monitored during all four runs. The propellant loading control unit was removed prior to Run 417 and returned to San Diego.

The following table summarizes data obtained from the error demodulator output signal during the LO2 loading cycle of Runs 428, 430 and 431. Run 429 was terminated before the LO2 loading cycle was complete, therefore no data were obtained for the 90% and 99% LO2 levels.

All values are PU-sensed percent of nominal (2.25 LO2/fuel) mass ratio and are referenced to the time of the indicated Acoustica probe signal.

Run No.	% of Nominal Mass Ratio	
	Sensed at time of Acoustica LO2 90% probe	Sensed at time of Acoustica LO2 99% probe
428	88.7	102.6
430	*	103.2
431	91.6	102.3

*Premature signal. The PU system error trace is invalid at this time.

ACOUSTICA PROPELLANT LOADING CONTROL SYSTEM

The performance of the Acoustica Propellant Loading Control System was satisfactory for all runs except Run 430. On this run, the LO2 90% probe signalled LO2 RAPID LOAD STOP when the missile was only 66.9% full. The performance of the Acoustica PLCS during the fuel loading cycle of Run 430 was satisfactory. The LO2 overflow topping probe signalled during changeover to flight pressurization during Runs 430 and 431. However, this did not affect the performance of the system as all loading was complete.

These erroneous signals are due to the sensitivity setting of the control units, the values of which were determined and set for maximum sensitivity under Sequence II-L pressure to assure a positive cutoff signal.

MISSILE PRESSURIZATION SYSTEM

The Missile Pressurization System operated satisfactorily during Runs 428 and 429. However, during Run 428, prior to recycling the countdown, the missile LO2 tank pressure (F1001P) exceeded the red line (10 psig) due to a LO2 Loading System problem. See LO2 Loading System discussion for details of the problem. The maximum missile LO2 tank pressure reached was 10.7 PSIG when emergency pressurization was initiated. The missile fuel tank pressure

REPORT FM 1310

CONVAIR | ASTRONAUTICS

PAGE 6

(F1003P) was 28 PSIG and missile LO2 tank head pressure (U1901P) was 2.6 PSIG at this time. The minimum bulkhead differential pressure was 14.7 PSID. See Figure 7.

After the countdown was resumed for Run 428 the minimum and maximum missile LO2 tank pressure (F1001P) was satisfactory. The minimum and maximum missile LO2 tank pressures (F1001P) for Runs 429, 430 and 431 were satisfactory.

The boiloff valve performed satisfactorily, maintaining the desired missile LO2 tank pressure during all runs, except during the first attempt at Run 428, when rapid loading of LO2 into "hot" plumbing created more G02 than the valve could handle.

The fuel tank pressure was normal throughout all four runs.

This document contains information affecting the national defense of the United States within the meaning of the Espionage Laws, Title 18, USC, Sections 793 and 794. The transmission or the revelation of its contents in any manner to an unauthorized person is prohibited by law.

RED LINE VALUES EXCEEDED

The first attempt at Run 428 was aborted when Missile LO2 Tank Pressure (F1001P) rose to 10.7 PSIG during Sequence II-F pressures. The red line values for this measurement during Sequence II-F are a minimum of .9 PSIG and a maximum of 10 PSIG. All other measurements were satisfactory during Runs 428, 429, 430, 431. Red line values are tabulated in Test Directive ETD-OPH-5.

Ambient Conditions

Run 428

Ambient Temperature: 78 DGF
Barometric Pressure: 27.505 In. Hg.
Relative Humidity: 33%
Wind Direction: SW
Wind Velocity: 3 Knots

Run 429

Ambient Temperature: 95 DGF
Barometric Pressure: 27.440 In. Hg.
Relative Humidity: 17%
Wind Direction: NE
Wind Velocity: 7 Knots

Run 430

Ambient Temperature: 68 DGF
Barometric Pressure: 27.430 In. Hg.
Relative Humidity: 52%
Wind Direction: WSW
Wind Velocity: 16 Knots

Run 431

Ambient Temperature: 75 DGF
Barometric Pressure: 27.395 In. Hg.
Relative Humidity: 37%
Wind Direction: SW
Wind Velocity: 21 Knots

CONFIGURATION

The Phase III test article, missile assembly version number 7-31-27 is installed in the 1-95 Test Stand as required per 7-00027. This is a simulated operational missile which consists of "A", "B", "C" and "D" series components. These components are described in detail in the Block I Test Directive, Report No. ETD-OPH-4D. No significant changes have been made since the "D" revision, except as follows:

TVA 91457 authorizing connection of the Convair PLCU control units to Acoustica probes in the missile fuel tank has been cancelled and the Acoustica control units were restored to original configuration per TVA 91457B.

The Acoustica PLCU system was connected to control LO2 and fuel tanking per ETP-U-011.

Four Acoustica Control Units (P/N 50025219) for fuel tank probes were removed and replaced with Convair 7-04393-1 Control Units (Acoustica Model 810135, P/N 79404308).

TVA 91191, B change (7-89469) removes extension from engine LO2 tank line (29 July 1959).

TVA 91515 (7-89482) installs insulation on helium line between heater and helium ground disconnect (30 July 1959).

TVA 91517 (7-29232) installs insulation on all LO2 topping line switch lines (30 July 1959).

TVA 91516 (7-20220) installs insulation on LO2 "Y" duct and LO2 staging valve (30 July 1959).

GMA 5127 (7-86042) installs insulation on LO2 topping line from discharge LO2 subcooler to wall of transfer room (30 July 1959).

TVA 91508 (7-89482) removes orifice from LN2 exhaust port (30 July 1959).

TVA 91516B (7-20220) removes LO2 duct insulation aft of station 117, which is exterior of thrust structure (31 July 1959).

TVA 91519 (27-17524) installs measurement to determine back pressures in engine LO2 tank during initial fill (3 August 1959).

TVA 91521 (7-20227) increases size of engine LO2 tank overboard vent line to aid faster tank filling (4 August 1959).

TVA 91524 (27-17524) installs measurement for engine LO2 tank vent line pressure (4 August 1959).

This document contains information affecting the national defense of the United States within the meaning of the Espionage Laws, Title 18, USC, Sections 793 and 794. The transmission or the revelation of its contents in any manner to an unauthorized person is prohibited by law.

PAGE 50

TVA 91534 (27-17524) eliminates possible restriction in Engine LO2 Tank vent line (10 August 1959).

TVA 91530 (7-20227) installs orificed, overboard Engine LO2 Tank dump line with solenoid operated dump valve and provisions for flowmeter installation (11 August 1959).

TVA 91450B (7-20227) installed a one inch line from the main missile LO2 duct, between the B1 and B2 LO2 pump feed lines, to the Booster GG LO2 start line, between the Booster fill and check valve and the staging disconnect (14 August 1959).

TVA 91542 (7-20220) installed a scoop in the main missile LO2 duct to direct the flow of LO2 into the new engine LO2 tank fill line (14 August 1959).

Runs 428 and 429 were completed on 15 August 1959.

TVA 91516B (7-20220) installed insulation on the following LO2 ducting and valves: SK 19447-1 manifold, 7-23205-813 elbow assembly, 7-02230-9 valve, 7-02230-3 valve, and 27-02102-7 fill and drain valve. This same TVA also removed the following insulation for Run 431: from 7-23205-813 elbow assembly and from the portion of SK 19447-1 manifold which is inside the thrust section (18,19 August 1959).

TVA 91540C (7-20227) reroutes the new engine LO2 tank fill line to load line through the Booster fill and check valve.

HISTORY OF PROBLEMS (RUNS 428, 429, 430, 431)

On 15 August during first attempt at Run 428 Emergency Pressurization had to be initiated when missile LO2 tank pressure rose to 10.7 PSIG. Discovered that valve L-26 was not opened prior to attempted run.

This document contains information affecting the national defense of the United States within the meaning of the Espionage Laws, Title 18, USC, Sections 793 and 794. The transmission or the revelation of its contents in any manner to an unauthorized person is prohibited by law.

PROCEDURE HISTORY (RUNS 428, 429, 430, 431)

<u>Date</u>	<u>Procedure Used</u>	<u>Objectives</u>	<u>Results</u>
14 August	ETP-P-044 Propulsion System Leak and Functional Check	Leak and functionally check 7-31-27 propulsion system.	Satisfactory
14 August	ETP-F-055 Fuel Tank Purge	Replace the GN2 content of the mis- sile fuel tank with helium.	Satisfactory
15 August	ETP-M-004 Precountdown (Re- issue 7/20/59)	Prepare for countdown, Run 428.	Satisfactory
18 August	ETP-P-044 Propulsion System Leak and Functional Check	Leak and functionally check 7-31-27 propulsion system.	Satisfactory
18 August	ETP-F-055 Fuel Tank Purge	Replace the GN2 content of the mis- sile fuel tank with helium.	Satisfactory
19 August	ETP-M-004 Precountdown (Re- issue 7/20/59)	Prepare for countdown, Run 430.	Satisfactory
