20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This is the second in a continuing series of reports on the application of DIVWAG at Rodman Laboratory. The first report primarily examines the model and its operational utilization at Rodman Laboratory. In this report, the sensitivity of the DIVWAG model to extreme changes in the weather environment is evaluated. Two extremes were examined: (1) optimum weather - clear daylight with no precipitation and (2) minimum weather - dark with heavy precipitation. These extremes were evaluated to determine the impact of weather variations on the target acquisition process and the mobility of maneuver units as simulated in		

the DIVWAG model.

ACKNOWLEDGEMENT

The authors would like to thank Jolayne Yeager, Teresa Nicola, and Barbara Buranek for their assistance in preparing the manuscript in final form.

1.0 INTRODUCTION - WEATHER ANALYSIS

This is report number two of an on-going study utilizing DIVWAG, a computer simulation of a Division Level War Game, to determine the significance of varying battlefield parameters; i.e., artillery parameters, troop and equipment mobility parameters, and weather parameters. In report number R-TR-76-008, the first study in the sequence, the random number seed was changed and the results indicate that the overall battle results were unaffected. During this study, weather parameters were varied to simulate:

- a. optimum visibility
- b. minimum visibility.

2.0 CONCLUSIONS AND RECOMMENDATIONS

In order to determine the sensitivity of DIVWAG to weather parameter variations, the following extremes were examined:

- a. Good weather-maximum visibility, no precipitation
- b. Bad weather- minimum visibility with precipitation.

These runs were subjected to detailed analyses of the following:

- c. Total Force Losses by Cause
- d. Artillery Effectiveness
- e. Target Acquisition
- f. Ground Combat Engagements
- g. Force Movement

A summary of results by category is contained in this report.

2.1 Total Force Losses by Cause

Blue equipment and personnel losses are significantly lower in bad weather (Figure 1). Red losses (Figure 2) are about the same in bad weather, except for trucks and artillery weapons; artillery losses are insignificant with less than 2 systems lost. The significant reduction in Red truck losses is due primarily to a reduction in Blue counterbattery fire during bad weather since the bulk of truck assets are allocated to artillery units. As expected, both Red and Blue personnel and equipment losses caused by artillery and close air support are reduced during bad weather.

2.2 Artillery Effectiveness

Blue artillery is slightly degraded during bad weather (5% fewer rounds) while Red artillery is drastically degraded (35% fewer rounds). Blue 155MM SP's inflict 9% more casualties in bad weather than in good weather, but this is the exception. The only Red artillery weapons doing better in bad weather are the 130MM guns, but this statistic is tempered by the few casualties occurring in both games. The number of counter-battery missions are substantially decreased in bad weather - - 29% for the Blue and 50% for the Red.

2.3 Target Acquisition

Basically, the same targets are acquired in both good and bad weather. Overall, there is also little difference as to time of first detection,

size, type, and activity for the Red targets. Red maneuver units, however, are detected an average of 21 minutes earlier in good weather. The Red sensors' estimate of the size of Blue targets varies significantly from good weather to bad weather.

2.4 Ground Combat Engagements

There are seven battles or engagements between the Red and Blue forces. An engagement in bad weather occurs later than the same engagement in good weather. Although fewer rounds are fired and fewer systems are destroyed by both forces during bad weather, there is actually an improvement in the losses per round fired ratio (23% for Blue and 26% for Red - Figures 17 and 18). There is relatively no change in Blue rounds fired at Red tanks, but there are approximately one-third fewer Red rounds fired at Blue tanks in bad weather.

2.5 Force Movement

The Red force required 13% more time in bad weather than in good weather to advance virtually the same distance. Actually, there was a 1% reduction in ground gained by the Red force in the bad weather games as compared to the good weather game. Also, in bad weather, the Blue force required 7% less time to cover 11% less distance than in good weather.

In conclusion, the model has proven sensitive to different sets of weather parameters. Decreased visibility is more detrimental to the Red attackers than the Blue defenders. It is recommended that this study be followed by a study of such parameters as; extended range artillery performance, suppression time, rate of fire, and lethal areas.

3.0 DISCUSSION

The physical environment of the area of combat operations plays a significant role in the execution of military activities. For this reason, it was decided initially to subject the weather parameters to sensitivity testing. Later in subsequent studies, the parameters mentioned in Section 2. will be conducted. Within DIVWAG, weather conditions are described for each hour of game time in terms of the following parameters:

- a. Temperature (in degrees Fahrenheit)
- b. Precipitation (none, light, or heavy)
- c. Fog (yes or no)
- d. Cloud cover (percent)
- e. Wind speed (knots)
- f. Wind direction (azimuth in degrees)
- g. Relative humidity (percent)
- h. Visibility index (1-9; 1 worst, 9 best).

The first seven parameters above are established in the pregame phase as a portion of the data load. Additionally, parameters describing moon conditions (quarter, moonrise, and moonset), sun conditions (time for beginning morning nautical twilight (BMNT), and evening nautical twilight (EENT), sunrise and sunset) are also set at this time. The visibility index is determined from the cloud cover, precipitation and fog parameters, and the times of sunset, sunrise, moonrise, and moonset. These weather parameters are used in the Ground Combat, Air/Ground Engagement, Movement, Intelligence and Control, and Engineer Models to represent the impact of weather conditions on line of sight, mobility, weapons effects, etc.

Two weather extremes were examined:

- i. Good weather - 10:00 in the morning and maximum visibility
- j. Bad weather - 4:00 in the morning and minimum visibility.

These weather differences have been analyzed for:

- k. Total Force Losses by Cause
- l. Artillery Effectiveness
- m. Target Acquisition
- n. Ground Combat
- o. Movement

Throughout this report GOOD will be used to indicate good weather

and BAD will be used to indicate bad weather.

3.1 Total Force Losses by Cause

Blue and Red force losses for GOOD and BAD are compared in Figures 1 and 2. Blue losses are significantly less during BAD for all categories while Red losses per category are within $\pm 10\%$, except for trucks and artillery weapons. There are not enough Red artillery weapons affected to yield any significant results, but there are 42% fewer Red trucks lost in BAD.

CATEGORY	GOOD WEATHER	BAD WEATHER	% DIFF
1. Personnel	668	487	-27
2. Tanks	60.46	44.09	-27
3. Vehicle-mounted antitank guided missiles	14.82	11.09	-25
4. Personnel carriers and other tracked vehicles	48.54	41.69	-14
5. Trucks	187.46	163.55	-13
6. Man-packed antitank guided missiles	54.35	44.98	-17
7. Other antitank weapons	222.05	183.14	-18
8. Artillery weapons	0.35	0.08	-77

Figure 1 Total Blue Losses

CATEGORY	GOOD WEATHER	BAD WEATHER	% DIFF
1. Personnel	2654	2499	-6
2. Tanks	62.20	66.32	+7
3. Vehicle-mounted antitank guided missiles	13.85	13.56	-2
4. Personnel carriers and other tracked vehicles	82.90	86.03	+4
5. Trucks	79.26	46.10	-42
6. Man-packed antitank guided missiles	14.79	13.95	-6
7. Other antitank weapons	139.56	127.52	-9
8. Artillery weapons	1.20	0.82	-32

Figure 2 Total Red Losses

A loss exchange comparison for personnel, tanks, and all other direct fire systems involved is made in Figure 3. An increased Blue force effectiveness is clearly demonstrated during BAD by the exchange loss ratio; i.e.. 18% increase in direct fire systems losses other than tanks, 29% increase in personnel losses, and 46% increase in tank exchange ratios.

TYPE WEATHER	RED LOSSES			BLUE LOSSES			EXCHANGE RATIO (RED/BLUE)		
	PERSONNEL	TANKS	OTHER DIRECT FIRE	PERSONNEL	TANKS	OTHER DIRECT FIRE	PERSONNEL	TANKS	OTHER DIRECT FIRE
GOOD	2654	62.20	250.25	668	60.46	336.91	3.97:1	1.03:1	0.74:1
BAD	2499	66.32	240.52	487	44.09	277.83	5.13:1	1.50:1	0.87:1
% CHANGE	-6	+7	-4	-27	-27	-18	+29	+46	+18

Figure 3 Loss Exchange Comparison

Force losses are summarized by cause in Figures 4 and 5. It can be seen that percentage losses due to Red close air decreases during BAD. It should be noted that except for personnel, Red direct fire weapons are the major cause of Blue losses. From Figure 5, it can be seen that in all categories Blue direct fire weapons inflicted more losses in BAD than in GOOD. Except for personnel, there is little percentage of losses change due to BAD. The discussed personnel losses appear to be the result of less ground combat time.

A breakout of personnel losses by individual Blue and Red units is given in Figures 6 and 7. With respect to blue units, only two units (#213 and #217) are significantly different. During GOOD, #213 received 46 rounds of incoming artillery and suffered 16 casualties but in BAD received only 34 rounds of incoming artillery, suffering 6 casualties. During GOOD, #217 received 72 rounds of counterbattery fire, suffering 69 casualties. No counterbattery fire was received by #217 during BAD.

There are quite a few differences between GOOD and BAD for the Red units. During both GOOD and BAD, artillery units 563, 730, and 806 and maneuver units 677, 682, 693, 709, 759, and 764 finish the period with less than 60% of their original personnel strength. During GOOD only, artillery units 567, 775, and 808 are also under 60% of personnel strength. The military gamers during the original FASCAM¹ game considered 60% the level necessary to maintain unit effectiveness. Under this criterion, only three of the nine maneuver units engaged in ground combat are capable of

Figure 7 Personnel Losses by Red Units Having Military Activity

continuing the attack into Period 2.

3.2 Artillery Effectiveness

For reporting purposes, mortar fire has been included with artillery fire.

During BAD, Blue artillery fired 4 % fewer missions, assessed 7% fewer targets, fired 5% fewer total rounds, and inflicted 11% fewer personnel casualties (Figure 8) than during GOOD. Personnel losses/round fired are 6% greater during GOOD. Therefore, Blue artillery performance is not significantly altered due to the weather.

Red artillery fired 28% fewer missions, assessed 20% fewer targets, fired 35% fewer total rounds, and inflicted 25% fewer personnel casualties in BAD (Figure 9). Red artillery's ability to deliver fire is severely degraded due to poor weather. This is understandable because of the scenario posture of the Blue and Red forces for Period 1 (Red - attacking and Blue - primarily stationary defense).

TYPE WEATHER	MISSIONS FIRED	TARGETS ASSESSED	% MISSIONS ASSESSED	ROUNDS FIRED	PERSONNEL CASUALTIES INFLICTED	PERSONNEL LOSSES/ ROUND FIRED

% CHANGE	-28	-20	+10	-35	-25	+16

Figure 9 Red Artillery Force Comparison

Comparisons of Blue and Red artillery are made by weapon type in Figures 10 and 11. Note that for Blue the 155MM SP weapons are unaffected by the weather extremes as far as total missions fired and total rounds fired; consequently, the 155MM SP percentage of total force rounds is up 2.5% in BAD. Total mortar rounds are decreased 2.5% in BAD. The 155MM Towed and 203MM SP weapons fire fewer rounds in BAD and have a substantial decrease in the personnel losses/round fired ratio.

Note that no Red mortars were fired in BAD. In DIVWAG, mortars are organic to those units involved in ground combat. The priorities of fire, as determined by the Red gamers, is to use artillery as the primary method of attack. If insufficient artillery is available, the units' organic mortars are used. Due to a 35% reduction in the amount of Red artillery rounds fired in BAD, mortars never had to be used. The 130MM guns did appreciably better in BAD than in GOOD as far as % of missions assessed and personnel losses/rounds fired.

WEAPON TYPE	WEATHER TYPE	MISSIONS FIRED	TARGETS ASSESSED	% MISSIONS ASSESSED	ROUNDS FIRED	PERSONNEL CASUALTIES INFLICTED	PERSONNEL LOSSES/ROUND FIRED	% TOTAL ROUNDS FIRED

Figure 13 Red Artillery Assessments by Blue Target Types

3.3 Target Acquisition

The targets acquired are compared in Figures 14 and 15. Basically, there is little difference as to time of first detection, size, type, and activity for the Red targets. There is a substantial difference in the time of last detection. With the exception of #806 (an artillery battalion), the only units affected are the maneuver units engaged in ground combat. These maneuver units are detected an average of 21 minutes earlier in GOOD than in BAD.

The Red forces estimated size of the Blue targets varies quite a bit from GOOD to BAD. There are 40 Blue and 11 Red sensor reports in BAD.

The number of Red close air sorties was reduced from 16 in GOOD to 8 in BAD. There were 6 Blue attack helicopter sorties in both GOOD and BAD.

3.4 Ground Combat Engagements

There are seven battles or engagements between the Red and Blue Force in the two hour game described by this report. These battles are summarized in Figure 16.

FORCE TYPE	IUID	MOVEMENT (METERS)		BATTLE ID	
		GOOD	BAD	GOOD	BAD
BLUE	7	923	0	1-1A	1
RED	709	4025	3567	1-1A	1
BLUE	14	916	538	2-2A	2
RED	693	4038	3924	2-2A	2
BLUE	21	2150	500	3-3A	3
RED	682	1580	1257	3-3A	3
BLUE	34	4201	4860	4-4A	4-4A
RED	677	1342	2769	4-4A	4-4A
RED	800	1152	1152	4-4A	4-4A
BLUE	54	0	0	5	5
RED	783	4885	4887	5	5
RED	795	1971	1971	5	5
BLUE	41	3307	1989	6-6A	6-6A
RED	764	3217	2575	6-6A	6-6A
BLUE	48	4173	2693	7-7A	7-7A
RED	759	4077	3514	7-7A	7-7A

Figure 16 Maneuver Units Engaged in Ground Combat

Battles suffixed with the letter "A", (involves the withdrawal of the Blue units) occur when the involved Blue unit's personnel strength drops below 90%. Note that some of the "A" battles (1A, 2A, and 3A) are not consummated in BAD. This is due to:

- a. Fewer personnel losses in BAD, and/or
- b. Degradation of movement rates in BAD.

Blue and Red systems (direct fire weapons only) lost by maneuver units engaged in ground combat are tabulated in Figures 17 and 18. An engagement in BAD occurs later than the same engagement in GOOD and

usually with the combatants being nearer each other. Thus, although fewer rounds are fired and fewer systems killed by both forces in BAD, there is actually an improvement in the loss per round fired ratio (+23% for Blue and +26% for Red). There is relatively no change in Blue rounds fired at Red tanks, regardless of weather. The loss exchange ratio (Blue/Red) was 0.483 (88.029/182.089) in GOOD and 0.395 (66.851/169.319) in BAD. This is an increase of 18% in Blue effectiveness during BAD.

3.5 Force Movement

Blue and Red individual unit movements are tabulated in Figures 19 and 20. The Blue force had a total movement of 110,005 meters in 862.58 minutes in GOOD and 97,619 meters in 805.66 minutes in BAD. This represents a 11% decrease in distance moved in 7% less elapsed time. The Red force had a total movement of 113,960 meters in 1123.48 minutes and 112,828 meters in 1274.88 minutes in Good and Bad respectively. This implies a 13% greater elapsed time to move 1% less distance.

A breakout of force movement by unit types is given in Figure 21. Analysis of this figure shows a definite advantage for the Blue defense during BAD (much less movement by the direct support artillery batteries and the maneuver units engaged in ground combat).

DISTRIBUTION LIST

A. Dept. of the Defense

Defense Documentation Center
ATTN: TIPCR (12)
Cameron Station
Alexandria, VA 22314

B. Dept. of the Army

Commander
Rock Island Arsenal
ATTN: SARRI-LR (5)
ATTN: SARRI-LPL (2)
ATTN: SARRI-L (1)
Rock Island, IL 61201

Commandant
US Army Field Artillery School
ATTN: ATSF-D-L, LTC Dublisky (1)
Fort Sill, OK 73503

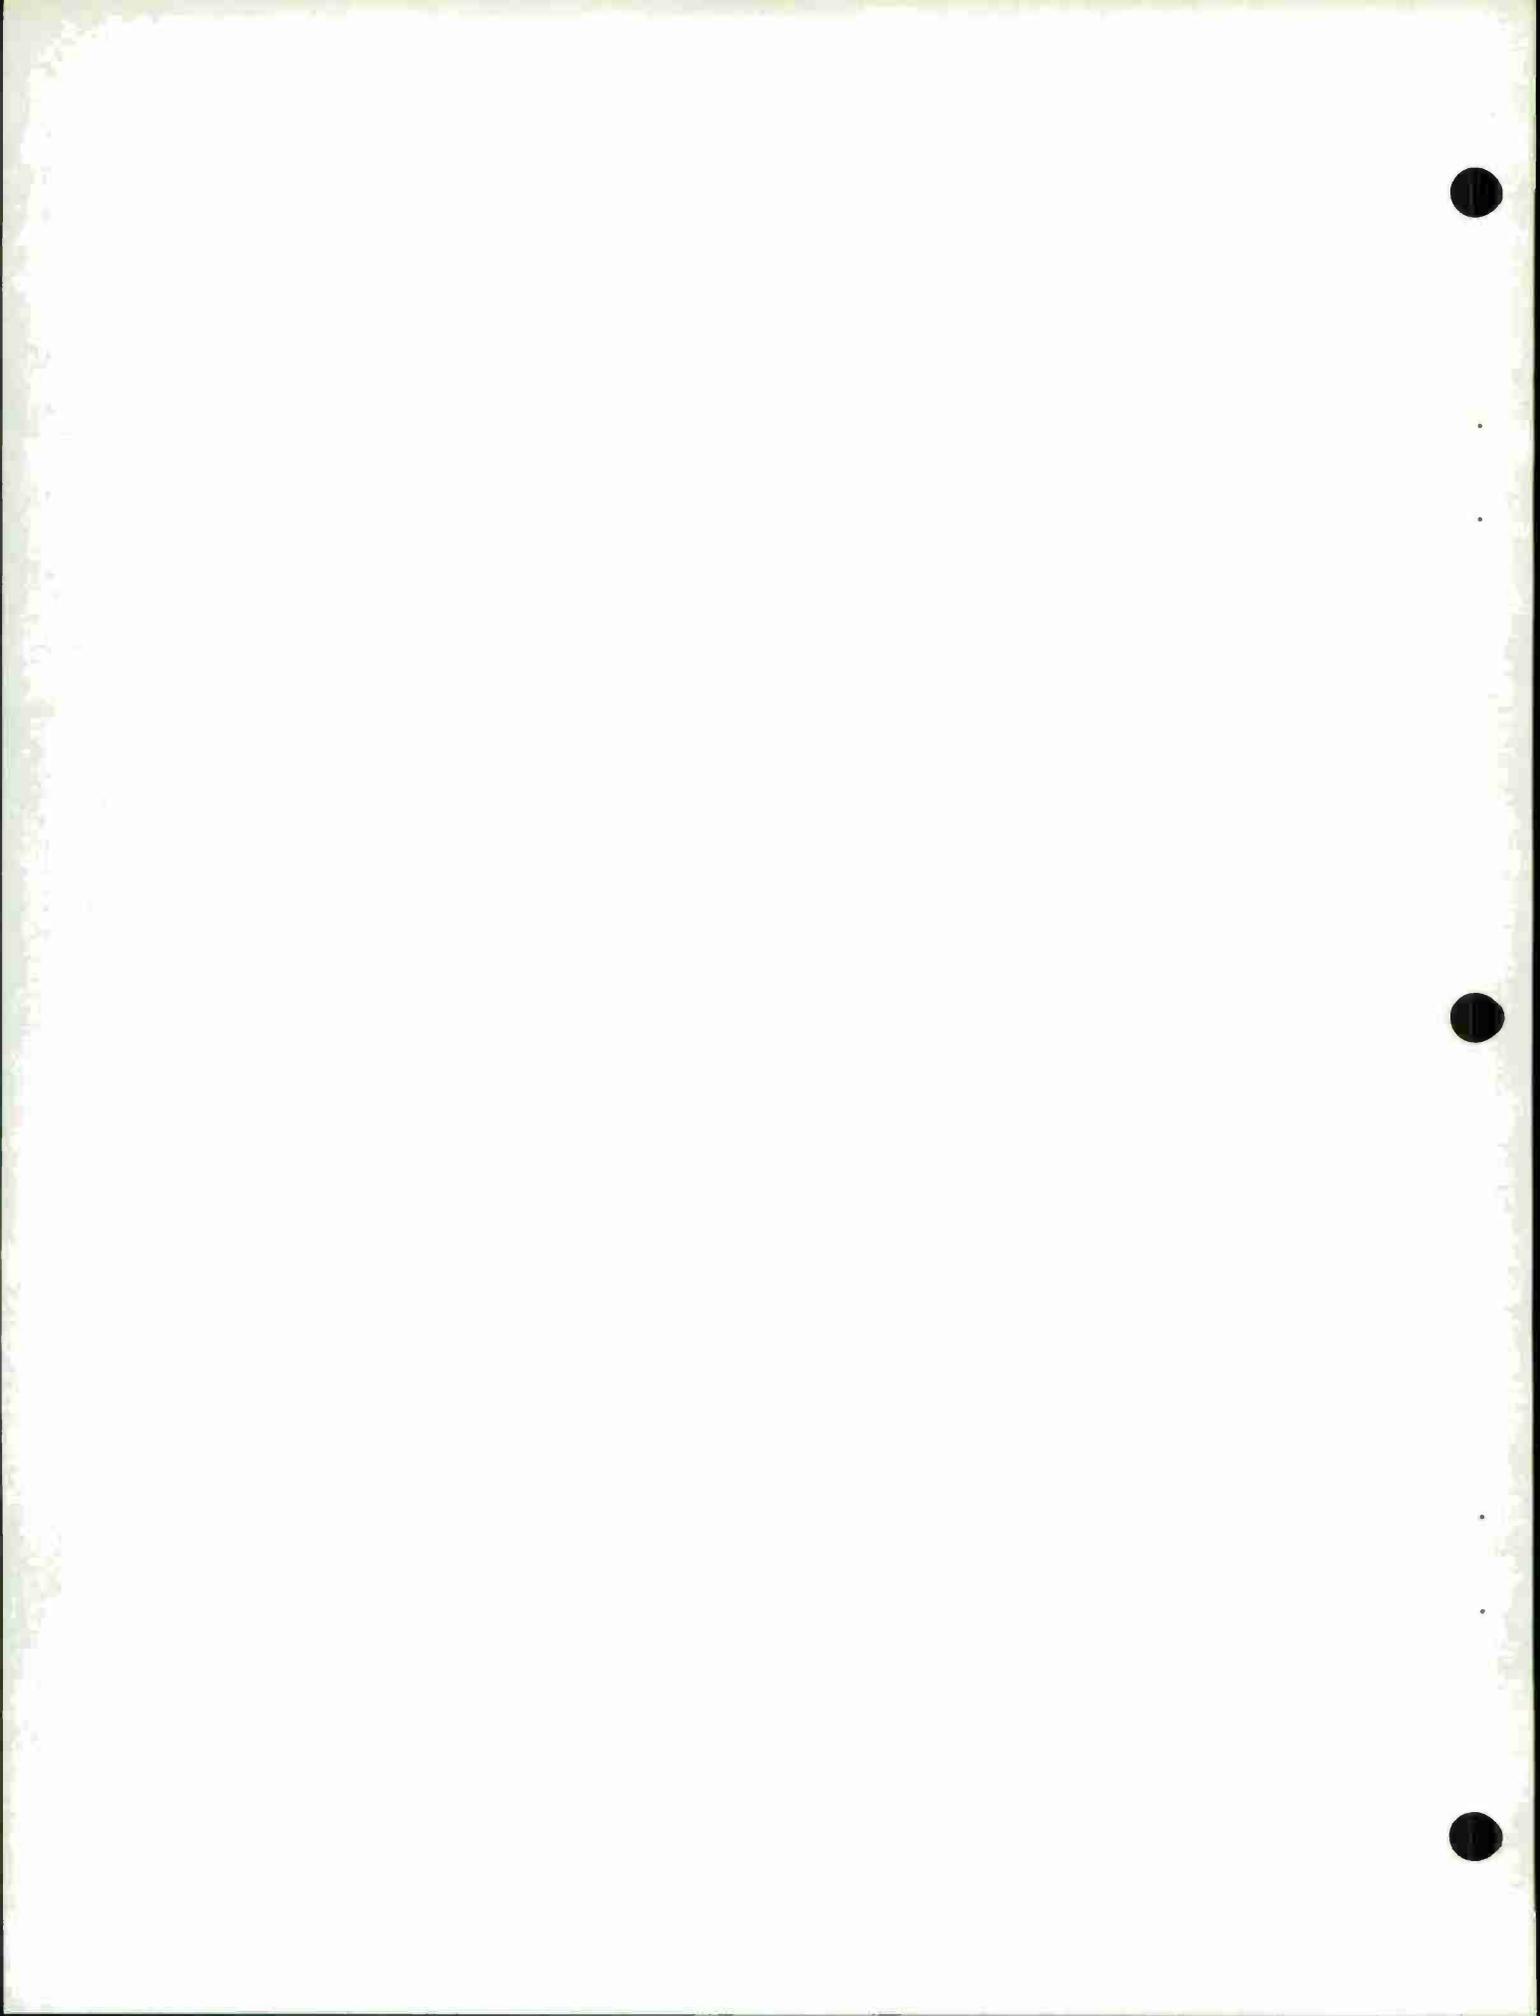

Commander
USA Combined Arms Combat Development Activity
ATTN: CACDA at CACA, CPT Mather (1)
Fort Leavenworth, KS 66027

Director
US Army Material Systems Analysis Activity
ATTN: AMXSY-GS, Mr. Blankenbiller (1)
Aberdeen Proving Ground, MD 21005

Director
US Army Ballistic Research Laboratory
ATTN: AMXBR-CAL, Mr. Harry Reed (1)
Aberdeen Proving Ground, MD 21005

Commander
US Army Armament Command
ATTN: AMSAR-SAS, Mr. S. Olson (1)
ATTN: AMSAR-RDT-L, Mr. L. Johnson (1)
Rock Island, IL 61201

Director
TRADOC Systems Analysis Agency
ATTN: ATAA-TBA, Mr. D. Padgett (1)
White Sands, NM 88002

DISTRIBUTION LIST UPDATE

- - - FOR YOUR CONVENIENCE - - -

Government regulations require the maintenance of up-to-date distribution lists for technical reports. This form is provided for your convenience to indicate necessary changes or corrections.

If a change in our mailing lists should be made, please check the appropriate boxes below. For changes or corrections, show old address *exactly* as it appeared on the mailing label. Fold on dotted lines, tape or staple the lower edge together, and mail.

Rock Island, Illinois 61201

FOLD HERE

AD _____ ACCESSION NO. _____
Research Directorate, General Thomas J. Rodman Laboratory
Rock Island Arsenal, Rock Island, Illinois 61201

Sensitivity of DIWVAG to Variations
in Weather Parameters

Prepared by: Jerry W. Frantz, George E. Stiles
CPT Michael A. Roddy III, William A. Werker
Security Class. (of this report): Unclassified
Technical Report R-TR-76-009

20 Pages, Incl Figures

This is the second in a continuing series of reports on the application of DIWVAG at Rodman Laboratory. The first report primarily examines the model and its operational utilization at Rodman Laboratory. In this report, the sensitivity of the DIWVAG model to extreme changes in the weather environment is evaluated. Two extremes were examined: (1) optimum weather - clear daylight with no precipitation and (2) minimum weather - dark with heavy precipitation. These extremes were evaluated to determine the impact of weather variations on the target acquisition process and the mobility of maneuver units as simulated in the DIWVAG model.
