Topical Hazard Evaluation
USDA Proprietary Compound
A13-36406
Candidate Repellent
eye irritation

20. ABSTRACT (Continue on reverse side if necessary and identify by block number)
A preliminary hazard evaluation of AI3-36406 was performed by means of laboratory animal studies using rats, rabbits, and guinea pigs. The technical grade compound caused mild corneal and conjunctival irritation in rabbits, but no primary or photoreirritation on skin. It did not sensitize guinea pigs or prove to be an acute ingestion hazard. Ethanol solutions of AI3-36406 USDA Proprietary Compound, caused mild skin irritation.
A summary of the pertinent findings and recommendations of the inclosed report follows:

A preliminary hazard evaluation of AI3-36406 was performed by means of laboratory animal studies using rats, rabbits and guinea pigs. The technical grade compound caused mild corneal and conjunctival irritation in rabbits, but no primary or photoinflammation on skin. It did not sensitize guinea pigs or prove to be an acute ingestion hazard. Ethanol solutions of AI3-36406 caused mild skin irritation. It was recommended that AI3-36406, USDA proprietary compound, be approved for further testing as a candidate repellent. Consideration should be given to the irritant nature of ethanol solutions when formulating this repellent, and persons experiencing irritation should wash the compound off as soon as possible.

TOPICAL HAZARD EVALUATION PROGRAM
OF CANDIDATE INSECT REPELLENT AI3-36406
US DEPARTMENT OF AGRICULTURE PROPRIETARY COMPOUND
STUDY NO. 75-51-0883-79
MAY 1976 - JUNE 1979

1. AUTHORITY.

b. Memorandum of Understanding between the Department of the Army, Office of The Surgeon General; the US Army Health Services Command; the US Army Environmental Hygiene Agency; the Armed Forces Pest Control Board; and the US Department of Agriculture; effective 1970 with Amendment 1, effective August 1974.

3. PURPOSE. The purpose of this program is to provide guidance for further entomological testing of the candidate insect repellent AI3-36406.

4. SUMMARY OF FINDINGS. A hazard evaluation of the candidate repellent AI3-36406, USDA Proprietary Compound, was conducted by this Agency using New Zealand White rabbits for skin and eye studies, Hartley guinea pigs for a skin sensitization study and Sprague-Dawley rats for determination of oral toxicity. A tabular presentation of animal toxicity data developed in this Agency follows:*†

* In conducting the studies described in this report, the investigators adhered to the "Guide for the Care and Use of Laboratory Animals," US Department of Health, Education, and Welfare Publication No. (NIH) 74-23, revised 1972.

† The experiments reported herein were performed in animal facilities, fully accredited by the American Association for the Accreditation of Laboratory Animal Care.

Approved for public release; distribution unlimited.

### PHOTOCHEMICAL SKIN IRRITATION STUDIES

#### Rabbits

A single 0.05 ml application of a 25 percent (w/v) solution of the compound and a 10 percent (w/v) oil of Bergamot solution (positive control) in 95 percent ethyl alcohol were applied to the intact skin of six rabbits. Five minutes after application, the rabbits were exposed to UV light (365 nm) for 30 minutes at a distance of 10-15 cm.

A 25 percent solution of Al3-36406 in ethanol did not cause a photochemical irritation reaction under test conditions. Positive control application and irradiation caused greater irritant effects than in unirradiated skin areas.

Compound Al3-36406 did not cause a photochemical irritation reaction under test conditions and is not expected to cause a photochemical irritation in humans.

#### Control

Following UV exposures of the rabbits, 0.05 ml of test compound, positive control and diluent were applied to additional skin areas to serve as unirradiated control sites. Application areas were checked for skin irritation at 24, 48 and 72 hours.

Ethanol solutions of Al3-36406 caused mild primary irritation at both UV and non-UV sites.

Ethanol solutions of Al3-36406 may be irritating to human skin.
**SENSITIZATION STUDIES**

**Guinea Pigs (Male)**

Intradermal injections of 0.1 ml of a 0.1 percent suspension (w/v) of Al3-36406 or of dinitrochlorobenzene (DNCB)* in a mixture containing 1 volume of propylene glycol and 29 volumes of saline.

Ten test guinea pigs were given ten sensitizing doses over a 3-week period. After 2 weeks' rest, they were challenged with ID injections of test compound.

Ten positive control guinea pigs were sensitized over 3 weeks to DNCB. After 2 weeks' rest, they were challenged with ID injections of DNCB.

* A known skin sensitizer
Study No. 75-51-0883-79, May 76 - Jun 79

5. CONCLUSION. Technical grade compound AI3-36406 caused mild corneal and conjunctival irritation in rabbits, but no primary or photoirritation on skin. It did not sensitize guinea pigs or prove to be an acute ingestion hazard. Ethanol solutions caused a primary irritation reaction in rabbits, and may cause a similar reaction in man.

6. RECOMMENDATION. Under the provisions of the Memorandum of Understanding (paragraph 1b), it is recommended that AI3-36406, USDA Proprietary Compound, be approved for further testing as a candidate insect repellent. Ethanol solutions may be irritating to skin, hence, consideration should be given when formulating the ultimate use formulation. Persons experiencing such a reaction should wash the compound off with copious amounts of water.

Chief, Toxicology Division
APPENDIX

TOPICAL HAZARD EVALUATION PROGRAM
DEFINITIONS OF CATEGORIES OF COMPOUNDS BEING
CONSIDERED FOR ACUTE SKIN APPLICATION

CATEGORY I - Compounds producing no primary irritation of the intact skin or
no greater than mild primary irritation of the skin surrounding an abrasion.
(INTERPRETATION: No restriction for acute application to the human skin.)

CATEGORY II — Compounds producing mild primary irritation of the intact
skin and the skin surrounding an abrasion. (INTERPRETATION: Should be used only
on human skin found by examination to have no abrasions or may be used as a
clothing impregnant.)

CATEGORY III - Compounds producing moderate primary irritation of the intact
skin and the skin surrounding an abrasion. (INTERPRETATION: Should not be
used directly on the skin without a prophetic patch test having been
conducted on humans to determine irritation potential to human skin. May be
used without patch testing, with extreme caution, as clothing impregnants.
Compound should be resubmitted in the form and at the intended use
concentration so that its irritation potential can be reexamined using other
test techniques on animals.)

CATEGORY IV - Compounds producing moderate to severe primary irritation of
the intact skin and of the skin surrounding an abrasion and, in addition,
producing necrosis, vesiculation, and/or eschars. (INTERPRETATION: Should
be resubmitted for testing in the form and at the intended use concentration.
Upon resubmission, its irritation potential will be reexamined using other
test techniques on animals, prior to possible prophetic patch testing in
humans, at concentrations which have been shown not to produce primary
irritation in animals.)

CATEGORY V - Compounds impossible to classify because of staining of the skin
or other masking effects owing to physical properties of the compound.
(INTERPRETATION: Not suitable for use on humans.)

EYE CATEGORIES:

A. Compounds noninjurious to the eye. INTERPRETATION: Irritation of
human eyes is not expected if the compound should accidentally get into the
eyes, provided it is washed out as soon as possible.

B. Compounds producing mild injury to the cornea. INTERPRETATION:
Should be used with caution around the eyes.

C. Compounds producing mild injury to the cornea, and in addition some
injury to the conjunctiva. INTERPRETATION: Should be used with caution
around the eyes and mucosa.

D. Compounds producing moderate injury to the cornea. INTERPRETATION:
Should be used with extreme caution around the eyes.

E. Compounds producing moderate injury to the cornea, and in addition
producing some injury to the conjunctiva. INTERPRETATION: Should be used
with extreme caution around the eyes and mucosa.

F. Compounds producing severe injury to the cornea and to the
conjunctiva. INTERPRETATION: Should be used with extreme caution. It is
recommended that use be restricted to areas other than the face.
