Approved for public release, distribution unlimited.

**ABSTRACT**
A preliminary hazard evaluation of A13-70820-Ga was performed by means of laboratory animal studies using rats, rabbits, and guinea pigs. The technical grade compound caused mild primary skin irritation and mild corneal irritation. It did not cause any photoirritation, did not sensitize guinea pigs, and did not prove to be an acute ingestion hazard. It was recommended that A13-70820-Ga, US Department of Agriculture Proprietary Compound, be approved for further testing as a candidate insect repellent.

A summary of the pertinent findings and recommendations of the inclosed report follows:

A preliminary hazard evaluation of A13-70820-Ga was performed by means of laboratory animal studies using rats, rabbits, and guinea pigs. The technical grade compound caused mild primary skin irritation and mild corneal irritation. It did not cause any photoirritation, did not sensitize guinea pigs, and did not prove to be an acute ingestion hazard. It was recommended that A13-70820-Ga, US Department of Agriculture Proprietary Compound, be approved for further testing as a candidate insect repellent.

USDA, ARS-Southern Region
1. AUTHORITY.
   b. Memorandum of Understanding between the US Army Environmental Hygiene Agency; the US Army Health Services Command; the Department of the Army Office of The Surgeon General; the Armed Forces Pest Control Board; and the US Department of Agriculture, Agricultural Research, Science and Education Administrations, titled, Coordination of Biological and Toxicological Testing of Pesticides, effective 23 January 1979.

3. PURPOSE. The purpose of this program is to provide guidance for further entomological testing of the candidate insect repellent AI3-70820-Ga.

4. SUMMARY OF FINDINGS. A hazard evaluation of the candidate repellent AI3-70820-Ga, US Department of Agriculture (USDA) Proprietary Compound, was conducted by this Agency using New Zealand White rabbits for skin and eye studies, Hartley guinea pigs for a skin sensitization study, and Sprague-Dawley rats for determination of oral toxicity. A tabular presentation of animal toxicity data developed in this Agency follows:*t

* In conducting the studies described in this report, the investigators adhered to the "Guide for the Care and Use of Laboratory Animals," US Department of Health, Education and Welfare Publication No. (NIH) 74-23, revised 1978.
† The experiments reported herein were performed in animal facilities, fully accredited by the American Association for the Accreditation of Laboratory Animal Care.

Study No. 75-51-0230-80, Aug 79 - Jan 80
### Test Results Interpretation

**PHOTOCHEMICAL SKIN IRRITATION STUDIES**

**Rabbits**

A single 0.05 ml application of a 25-percent (w/v) solution of the compound and a 10-percent (w/v) Oil of Bergamot solution (positive control) in 95-percent ethyl alcohol were applied to the intact skin of six rabbits. Five minutes after application, the rabbits were exposed to UV light (365 nm) for 30 minutes at a distance of 10-15 cm.

Positive control application and irradiation caused greater irritant effects than in unirradiated skin areas.

A 25-percent solution of A13-70820-Ga in ethanol did not cause a photochemical irritation reaction under test conditions.

Compound A13-70820-Ga did not cause a photochemical irritation reaction under test conditions and is not expected to cause a photochemical irritation in humans.

**Control**

Following UV exposures of the rabbits, 0.05 ml of test compound, positive control and diluent were applied to additional skin areas to serve as unirradiated control sites. Application areas were checked for skin irritation at 24, 48 and 72 hours.

* A known skin sensitizer
5. CONCLUSION. Technical grade compound AI3-70820-Ga caused mild primary skin irritation and mild corneal irritation. It did not cause any photoirritation, did not produce any sensitization reaction, and did not prove to be an acute ingestion hazard.

6. RECOMMENDATION. Under the provisions of the Memorandum of Understanding (paragraph 1b), it is recommended that AI3-70820-Ga, USDA Proprietary Compound, be approved for further testing as a candidate insect repellent.

APPENDIX

TOPICAL HAZARD EVALUATION PROGRAM
DEFINITIONS OF CATEGORIES OF COMPOUNDS BEING CONSIDERED FOR ACUTE SKIN APPLICATION

CATEGORY I - Compounds producing no primary irritation of the intact skin or no greater than mild primary irritation of the skin surrounding an abrasion. (INTERPRETATION: No restriction for acute application to the human skin.)

CATEGORY II - Compounds producing mild primary irritation of the intact skin and the skin surrounding an abrasion. (INTERPRETATION: Should be used only on human skin found by examination to have no abrasions or may be used as a clothing impregnant.)

CATEGORY III - Compounds producing moderate primary irritation of the intact skin and the skin surrounding an abrasion. (INTERPRETATION: Should not be used directly on the skin without a prophetic patch test having been conducted on humans to determine irritation potential to human skin. May be used without patch testing, with extreme caution, as clothing impregnants. Compound should be resubmitted in the form and at the intended use concentration so that its irritation potential can be reexamined using other test techniques on animals.)

CATEGORY IV - Compounds producing moderate to severe primary irritation of the intact skin and of the skin surrounding an abrasion and, in addition, producing necrosis, vesiculation, and/or eschars. (INTERPRETATION: Should be resubmitted for testing in the form and at the intended use concentration. Upon resubmission, its irritation potential will be reexamined using other test techniques on animals, prior to possible prophetic patch testing in humans, at concentrations which have been shown not to produce primary irritation in animals.)

CATEGORY V - Compounds impossible to classify because of staining of the skin or other masking effects owing to physical properties of the compound. (INTERPRETATION: Not suitable for use on humans.)

EYE CATEGORIES:

A. Compounds noninjurious to the eye. INTERPRETATION: Irritation of human eyes is not expected if the compound should accidentally get into the eyes, provided it is washed out as soon as possible.

B. Compounds producing mild injury to the cornea: INTERPRETATION: Should be used with caution around the eyes.
C. Compounds producing mild injury to the cornea and, in addition, some injury to the conjunctiva. INTERPRETATION: Should be used with caution around the eyes and mucosa.

D. Compounds producing moderate injury to the cornea. INTERPRETATION: Should be used with extreme caution around the eyes.

E. Compounds producing moderate injury to the cornea and, in addition, producing some injury to the conjunctiva. INTERPRETATION: Should be used with extreme caution around the eyes and mucosa.

F. Compounds producing severe injury to the cornea and to the conjunctiva. INTERPRETATION: Should be used with extreme caution. It is recommended that use be restricted to areas other than the face.
