**Title:** Phase I Dam Inspection Report

**National Dam Safety Program**

**Lake Champeleta Dam (MO 30880)**

**Boone County, Missouri**

**Authors:**
- Hoskins-Western-Sonderegger, Inc.
- Gordy, Michael E.; McMeekin, Harold P.; Hoskins

**Performing Organization:**
- U.S. Army Engineer District, St. Louis Dam Inventory and Inspection Section, LMSED-PD 210 Tucker Blvd., North, St. Louis, Mo. 63101

**Controlling Office:**
- U.S. Army Engineer District, St. Louis Dam Inventory and Inspection Section, LMSED-PD 210 Tucker Blvd., North, St. Louis, Mo. 63101

**Monitoring Agency:**
- UNCLASSIFIED

**Distribution Statement:**
- National Dam Safety Program, Lake Champeleta Dam (MO 30880), Missouri - Kansas City Basin, Boone County, Missouri. Phase I Inspection Report.

**Abstract:**
This report was prepared under the National Program of Inspection of Non-Federal Dams. This report assesses the general condition of the dam with respect to safety, based on available data and on visual inspection, to determine if the dam poses hazards to human life or property.
INSTRUCTIONS FOR PREPARATION OF REPORT DOCUMENTATION PAGE

RESPONSIBILITY. The controlling DoD office will be responsible for completion of the Report Documentation Page, DD Form 1473, in all technical reports prepared by or for DoD organizations.

CLASSIFICATION. Since this Report Documentation Page, DD Form 1473, is used in preparing announcements, bibliographies, and data banks, it should be unclassified if possible. If a classification is required, identify the classified items on the page by the appropriate symbol.

COMPLETION GUIDE

General. Make Blocks 1, 4, 5, 6, 7, 11, 13, 15, and 16 agree with the corresponding information on the report cover. Leave Blocks 2 and 3 blank.

Block 1. Report Number. Enter the unique alphanumeric report number shown on the cover.

Block 2. Government Accession No. Leave blank. This space is for use by the Defense Documentation Center.

Block 3. Recipient's Catalog Number. Leave blank. This space is for the use of the report recipient to assist in future retrieval of the document.

Block 4. Title and Subtitle. Enter the title in all capital letters exactly as it appears on the publication. Titles should be unclassified wherever possible. Write out the English equivalent for Greek letters and mathematical symbols in the title (see "Abstracting Scientific and Technical Reports of Defense-sponsored RDT&E," AD-667 000). If the report has a subtitle, this subtitle should follow the main title, be separated by a comma or semicolon if appropriate, and be initially capitalized. If a publication has a title in a foreign language, translate the title into English and follow the English translation with the title in the original language. Make every effort to simplify the title before publication.

Block 5. Type of Report and Period Covered. Indicate here whether report is interim, final, etc., and, if applicable, inclusive dates of period covered, such as the life of a contract covered in a final contractor report.

Block 6. Performing Organization Report Number. Only numbers other than the official report number shown in Block 1, such as series numbers for in-house reports or a contractor/grantee number assigned by him, will be placed in this space. If no such numbers are used, leave this space blank.

Block 7. Author(s). Include corresponding information from the report cover. Give the name(s) of the author(s) in conventional order (for example, John R. Doe or, if author prefers, J. Robert Doe). In addition, list the affiliation of an author if it differs from that of the performing organization.

Block 8. Contract or Grant Number(s). For a contractor or grantee report, enter the complete contract or grant number(s) under which the work reported was accomplished. Leave blank in in-house reports.

Block 9. Performing Organization Name and Address. For in-house reports enter the name and address, including office symbol, of the performing activity. For contractor or grantee reports enter the name and address of the contractor or grantee who prepared the report and identify the appropriate corporate division, school, laboratory, etc., of the author. List city, state, and ZIP Code.

Block 10. Program Element, Project, Task Area, and Work Unit Numbers. Enter here the number code from the applicable Department of Defense form, such as the DD Form 1496, "Research and Development Planning Summary," or the DD Form 1534, "Research and Development Planning Summary," which identifies the program element, project, task area, and work unit or equivalent under which the work was authorized.

Block 11. Controlling Office Name and Address. Enter the full, official name and address, including office symbol, of the controlling office. (Equates to funding/sponsoring agency. For definition see DoD Directive 5200.20, "Distribution Statements on Technical Documents."")

Block 12. Report Date. Enter here the day, month, and year or month and year as shown on the cover.

Block 13. Number of Pages. Enter the total number of pages.

Block 14. Monitoring Agency Name and Address (if different from Controlling Office). For use when the controlling or funding office does not directly administer a project, contract, or grant, but delegates the administrative responsibility to another organization.

Block 15 & 15a. Security Classification of the Report: Declassification/Downgrading Schedule of the Report. Enter in 15 the highest classification of the report. If appropriate, enter in 15a the declassification/downgrading schedule of the report, using the abbreviations for declassification/downgrading schedules listed in paragraph 4-207 of DoD 5200.1-R.

Block 17. Distribution Statement (of the abstract entered in Block 20, if different from the distribution statement of the report). Insert here the applicable distribution statement of the abstract from DoD Directive 5200.20, "Distribution Statements on Technical Documents."

Block 18. Supplementary Notes. Enter information not included elsewhere but useful, such as: Prepared in cooperation with . . . (translation of (or by) . . . Presented at conference of . . . To be published in . . .

Block 19. Key Words. Select terms or short phrases that identify the principal subjects covered in the report, and are sufficiently specific and precise to be used as index entries for cataloging, conforming to standard terminology. The DoD "Thesaurus of Engineering and Scientific Terms" (TEST), AD-672 000, can be helpful.

Block 20. Abstract. The abstract should be a brief (not to exceed 200 words) factual summary of the most significant information contained in the report. If possible, the abstract of a classified report should be unclassified and the abstract to an unclassified report should consist of publicly-releasable information. If the report contains a significant bibliography or literature survey, mention it here. For information on preparing abstracts see "Abstracting Scientific and Technical Reports of Defense-sponsored RDT&E," AD-667 000.

LAKE CHAMPETRA DAM
BOONE COUNTY, MISSOURI
MISSOURI IDENTIFICATION NO. 30880

PHASE I INSPECTION REPORT
NATIONAL DAM SAFETY PROGRAM

PREPARED BY
HOSKINS-WESTERN-SONDEREGGER, INC.
CONSULTING ENGINEERS
LINCOLN, NEBRASKA

UNDER DIRECTION OF
ST. LOUIS DISTRICT, CORPS OF ENGINEERS

FOR
GOVERNOR OF MISSOURI
MAY, 1979
SUBJECT: Lake Champetra Dam Phase I Inspection Report

This report presents the results of field inspection and evaluation of Lake Champetra Dam.

It was prepared under the National Program of Inspection of Non-Federal Dams.

This dam has been classified as unsafe, non-emergency by the St. Louis District as a result of the application of the following criteria:

1) Spillway will not pass the Probable Maximum Flood
2) Overtopping could result in dam failure.
3) Dam failure significantly increases the hazard to loss of life downstream.

SUBMITTED BY
Chief, Engineering Division

APPROVED:
Colonel, CE, District Engineer

Lake Champetra Dam was inspected by an interdisciplinary team of engineers from Hoskins-Western-Sandergerg, Inc. The purpose of the inspection was to make an assessment of the general condition of the dam with respect to safety, based upon available data and visual inspection, in order to determine if the dam poses hazards to human life or property.

The guidelines used in the assessment were furnished by the Department of the Army, Office of the Chief of Engineers, and developed with the help of several Federal and State agencies, professional engineering organizations, and private engineers. Based on these guidelines, this dam is classified as an intermediate size dam with a high downstream hazard potential. Failure would threaten life and property. The estimated damage zone extends approximately five and one half miles (and at this point enters the Missouri River) downstream from the dam. Within the damage zone are several farm dwellings, two secondary roads, and a bridge on Highway 63.

Our inspection and evaluation indicates that the spillway does not meet the criteria set forth in the recommended guidelines for an intermediate dam having a high hazard potential. The Probable Maximum Flood is the appropriate spillway design flood. The spillways will not pass the 100-year flood (flood having a one percent chance of being exceeded in any year) without overtopping the dam. The spillways will pass 15% of the Probable Maximum Flood and also the 10-year flood without overtopping the dam. The Probable Maximum Flood (PMF) is defined as the flood that may be expected from the most severe combination of critical meteorologic and hydrologic conditions that are reasonably possible in the region.

No design data were available for this dam. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency.
Other deficiencies observed during the inspection are small trees growing on the downstream slope, seepage outcrops in both abutment troughs, the plugged condition of the principal spillway riser, the absence of a trash rack on the principal spillway riser, the storage of a float boat or diving platform at the entrance to the emergency spillway and the fact that the low point on the crest of the dam is lower in elevation than the high point in the emergency spillway.

It is recommended that the Owner take action to correct or control the deficiencies stated above and described in detail in the body of this report.

1.1 GENERAL

a. Authority. The National Dam Inspection Act, Public Law 92-367, authorized the Secretary of the Army, through the Corps of Engineers, to initiate a program of safety inspection of dams throughout the United States. Pursuant to the above, the St. Louis District, Corps of Engineers, District Engineer directed that a safety inspection of Lake Champetra Dam be made.

b. Purpose of Inspection. The purpose of the inspection was to make an assessment of the general condition of the dam with respect to safety, based upon available data and visual inspection, in order to determine if the dam poses hazards to human life or property.

c. Evaluation Criteria. Criteria used to evaluate the dam were furnished by the Department of the Army, Office of the Chief of Engineers, in "Recommended Guidelines for Safety Inspection of Dams," Appendix D to "Report of the Chief of Engineers on the National Program of Inspection of Dams," dated May, 1975, and published by the Department of the Army, Office of the Chief of Engineers.

1.2 DESCRIPTION OF PROJECT

a. Description of Dam and Appurtenances.

(1) The dam is an earth fill about 675 feet in length with a maximum height of 58 feet ± located in moderately steep topography. Valley slopes are covered with colluvial loess from the uplands and clay residuum from the underlying bedrock.

(2) The principal spillway consists of a 24-inch diameter steel riser connected with a 12-inch diameter welded steel pipe conduit passing through the embankment.

(3) A vegetated earth emergency spillway is cut through the left abutment.

(4) The dam is equipped with a 12 inch gate valve controlled drawdown pipe.
(5) Pertinent physical data are given in paragraph 1.3 below.

b. **Location.** The dam is located in the southeast corner of Boone County, Missouri, as shown on Plate A-2. The dam is shown on Plate A-1 in the NW_k of Section 13, T45N, R12W. The lake formed behind the dam is shown in the NW_k of Section 13, T45N, R12W, and the NE_k of Section 14, T45N, R12W.

c. **Size Classification.** Criteria for determining the size classification of dams and impoundments are presented in the guidelines referenced in paragraph 1.1c above. Based on these criteria, this dam and impoundment is in the intermediate size category.

d. **Hazard Classification.** Guidelines for determining hazard classification are presented in the same guidelines as referenced in paragraph 1.1c above. Based on referenced guidelines, this dam is in the high hazard classification. The estimated damage zone extends approximately five and one half miles (and at this point enters the Missouri River) downstream from the dam. Within the damage zone are several farm dwellings, two secondary roads, and a bridge on Highway 63.

e. **Ownership.** The dam is owned by Kenneth Adams, Hartsburg, Missouri 56039.

f. **Purpose of Dam.** The dam forms a recreational lake covering about 38 acres and impounding about 530 acre-feet of water.

g. **Design and Construction History.** It was reported by Kenneth Adams that the dam was constructed in 1970 by Martin Brothers, Fulton, Missouri, and that it was designed by Bernard Browning from Fulton, Missouri. (Mr. Browning was contacted several times without success in securing plans for this dam.) It was also reported by Kenneth Adams that test holes were drilled on the site, that the dam has a clay core and was compacted with sheepfoot rollers.

h. **Normal Operating Procedure.** All spillways are uncontrolled and there are no operating procedures for this dam.

### 1.3 PERTINENT DATA

a. **Drainage Area.** 597 acres (0.93 square miles).

b. **Discharge at Damsite.**
(1) All discharges at the damsite are through a steel pipe principal spillway. The crest of the emergency spillway is above the low point on the dam.

(2) Estimated maximum flood at damsite -- unknown.

(3) The principal spillway capacity varies from 0 c.f.s. at elevation 609.7 to 15 c.f.s. at the crest of the dam (elevation 613.9 feet).

c. Elevations (feet above M.S.L.).
   (1) Top of dam - 613.9 ± (low point)
   (2) Principal spillway crest - 609.7 ±
   (3) Emergency spillway crest - 614.1 ±
   (4) Streambed at center line - 555.6 ±
   (5) Maximum tailwater - unknown

d. Reservoir. Length (feet) of maximum pool - 3,100 ±.

e. Storage (Acre-feet).
   (1) Top of dam - 690 ±
   (2) Principal spillway crest - 530 ±

f. Reservoir Surface (Acres).
   (1) Top of dam - 47 ±
   (2) Principal spillway crest - 38 ±

g. Dam.
   (1) Type - Earth fill
   (2) Length - 675 feet ± (measured)
   (3) Height - 58 feet ± (measured)
   (4) Top width - 24 to 26 feet (measured)
   (5) Side slopes
      (a) Downstream 2.8 to 2.9H to 1V (measured)
      (b) Upstream 4H on 1V (measured on exposure)
   (6) Zoning - unknown
   (7) Impervious core - unknown
   (8) Cutoff - unknown
   (9) Grout curtain - unknown
   (10) Wave protection - vegetated earth berm at normal pool elevation with no riprap.
   (11) Internal drains - unknown

h. Diversion Channel and Regulating Tunnel. None

i. Spillway.
(1) Principal
   
   (a) Type - uncontrolled, drop inlet, 24-inch diameter steel pipe riser, 6 feet + high with 12-inch steel pipe conduit. The presence of antiseep collars is not known.
   
   (b) Crest (invert) elevation - 609.7 feet +
       Outlet - 556.4 feet +
   
   (c) Length - 230 feet +

(2) Emergency

   (a) Type - uncontrolled, vegetated earth, cut through the left abutment, "U" shaped section about 55 feet across the top.
   
   (b) Control section - well vegetated earth, weir crest.
   
   (c) Crest elevation - 614.1 feet +
   
   (d) Approach Channel - well vegetated on slope of about 8%.
   
   (e) Exit Channel - well vegetated on slope exceeding 5%.

j. Regulating Outlets. None.
SECTION 2 - ENGINEERING DATA

2.1 DESIGN

No design data were available for this dam. Kenneth Adams reported that the dam was designed by Bernard Browning, Fulton, Missouri.

2.2 CONSTRUCTION

No construction data were available. It was reported that the dam was built in 1970 by Martin Brothers, Fulton, Missouri.

2.3 OPERATION

No data were available on spillway operation. It was reported by Kenneth Adams that the emergency spillway has not operated. The highest reservoir level observed by the owner was about elevation 612 feet and the lowest water level was about 608.5 feet.

2.4 EVALUATION

a. Availability. No data were available.

b. Adequacy. The field surveys and visual observation presented herein are considered adequate to support the conclusions of this report. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency. These seepage and stability analyses should be performed for appropriate loading conditions (including earthquake loads) and made a matter of record.

c. Validity. Not applicable.
SECTION 3 - VISUAL INSPECTION

3.1 FINDINGS

a. General. A visual inspection of the Lake Champetra Dam was made on May 31, 1979. Engineers from Hoskins-Western-Sonderegger, Inc., Lincoln, Nebraska making the inspection were: R. S. Decker, Geotechnical; Gordon Jamison, Hydrology; and M. McMeekin, Civil Engineer. Kenneth Adams, owner, met with the inspection crew prior to the inspection.

b. Dam.

(1) Geology and soils (abutment and embankment). The abutments consist of a thin mantle of CL or CH soil colluvium-residium over limestone bedrock. Limestone and chert float rocks (rocks detached from bedrock strata by weathering processes) are exposed on the valley sides. The bedrock is probably a member of the Jefferson City formation which is generally horizontally bedded and fractured. No indications of sink holes or solution cavities were noted in the area. Auger borings on the dam indicated plastic CL or CH materials to depths of 2 feet. The materials were probably borrowed from the colluvial-residual soils covering the valley slopes. Materials in the valley bottom consist of alluvial-colluvial plastic CL soils containing limestone and chert gravels. These soils are derived from the upland loess mantle and the residual soils developed on the valley slopes.

(2) Upstream Slope. The upstream slope is well vegetated with adapted grasses and clover. The compacted earth berm, 10 to 15 feet in width, extends from just below the normal pool level into the reservoir. It appeared to be on a slight slope with no water over it at the spillway elevation and 4 to 6 inches of water covering the lake side crest of the berm. Very little erosion was observed on the berm or upstream face. No rodent holes, slides or deformations were observed.

(3) Crest. The crest is well vegetated except for two vehicular travel ruts. The section between stations 4+50 and 6+00 (over the old channel) is about one foot lower in elevation than the ends of the dam which could be due to a lack of overfill to compensate for foundation consolidation. No holes, cracks or abnormal deformation were noted along the crest.
(4) Downstream slope. The downstream slope is well vegetated with grass. A few very small cottonwood trees were observed toward the right end of the dam. No rodent holes, cracks or abnormal deformations were noted on the slope. Seepage outcrops in both abutment troughs. The seep in the right abutment trough emerges at about elevation 591 feet and extends down the trough almost to the toe of the dam. The seepage discharge is carried in a narrow gully or channel varying in depth from 1 to 2 feet. Total seepage effluent from the right abutment was estimated at 0.5 gal/min. It was all clear but rust stained. Seep from the left abutment emerges at about elevation 586 feet (lower than the right abutment). Seep from the left abutment is also collected in a narrow ditch 2 to 2.5 feet in depth and discharges into the principal spillway scour hole. Total seep from the left abutment was estimated at 1 gal/min. All seepage was clear. No seepage was observed on the downstream slope of the dam and it would appear that the seepage observed comes through the limestone abutments.

(5) Miscellaneous. The excellent vegetation cover, the dimensions of the dam and the materials apparent in the dam would indicate that it could withstand significant overtopping without serious damage.

c. Appurtenant Structures.

(1) The principal spillway at the time of the inspection was not operating effectively. In fact, the top of the riser was submerged. A subsequent visit to the site showed that the inlet to the 12-inch steel pipe conduit at the bottom of the riser was almost completely plugged with a tree stump and trash. The owner was notified of this condition by letter. There is no trash rack over the top of the riser. No deterioration was noted in the steel riser or conduit.

(2) The emergency spillway is well vegetated. The exit channel just downstream from the crest is partially blocked by the storage of a float boat or diving platform. It did not appear that the spillway had operated. No slides, slumps or erosion was noted in the spillway. Discharges from the spillway should not endanger the dam.
Drawdown facilities consist of a 12-inch diameter welded steel pipe, with gate valve at the lower end, which passes through the base of the dam at about Station 6 + 30. The valve appears to be operable. It was reported by Kenneth Adams that this drawdown pipe was initially installed to pass the normal stream flow during construction of the dam.

d. Reservoir Area. No significant erosion or wave wash was noted around the shoreline of the reservoir.

e. Downstream Channel. The small natural channel downstream from the dam is overgrown with trees and shrubs. However, there is a broad, open, nearly level flood plain adjacent to the channel that should rapidly dissipate any flood crests in the channel.

3.2 EVALUATION

This structure appears to be in good shape. The present seepage through the abutments should not significantly affect the safety of the dam.

Deficiencies in maintenance of the spillways, plugged principal spillway riser and partially blocked emergency spillway, increase the potential for overtopping, and should be corrected. However, it would appear that the dam could withstand considerable overtopping without serious damage.
SECTION 4 - OPERATIONAL PROCEDURES

4.1 PROCEDURES

There are no controlled outlet works for this dam. The pool level is controlled by rainfall, evaporation, and the capacity of the uncontrolled spillways.

4.2 MAINTENANCE OF DAM

There does not appear to be a maintenance plan for this structure. Maintenance of the spillways is deficient. The principal spillway should be opened, and a suitable trash rack should be installed to prevent future plugging. The obstruction in the emergency spillway channel should be removed. The trees should be removed from the downstream slope and measures taken to prevent their recurrence.

4.3 MAINTENANCE OF OPERATING FACILITIES

The only operating facility consists of a 12-inch diameter welded steel drawdown pipe, with gate valve at the lower end, which passes through the base of the dam at about Station 6+30. The valve appears to be operable.

4.4 DESCRIPTION OF ANY WARNING SYSTEM IN EFFECT

There is no warning system in effect for this dam.

4.5 EVALUATION

There does not appear to be any serious potential of failure of this structure if regular maintenance operations are initiated in the near future.
SECTION 5 - HYDRAULIC/HYDROLOGIC

5.1 EVALUATION OF FEATURES

a. Design Data. No design data were found for this dam. Therefore, all computations are based on the field inspection and survey performed by the consultant. The plans, profiles, and cross sections from the survey are attached in Appendix C.

b. Experience Data. The drainage area, reservoir surface area, and elevation-storage data were developed from the USGS Jefferson City NW, Missouri 7.5 minute topographic quadrangle map. The hydraulic computations for the spillway and dam overtopping discharge ratings were based on data collected in the field at the time of the field inspection. There are no available records of reservoir operation. It was reported by Kenneth Adams that the vegetated, earthen emergency spillway has never operated. It was also reported by Kenneth Adams that after a 7 or 8 inch rainfall the water in the reservoir reached an elevation 2 feet below the emergency spillway crest.

(1) The steel pipe principal spillway was observed to be plugged with a tree stump and roots, severely limiting the spillway capacity. A letter was written to the owner strongly suggesting this condition be corrected.

(2) The vegetated, earthen emergency spillway, located on the left abutment of the dam is in good condition. The exit channel, just downstream from the crest is partially blocked with a float boat or diving platform. Discharges from the emergency spillway will not endanger the dam.

(3) The dam is equipped with a 12-inch diameter welded steel pipe drawdown facility which is operated by a gate valve at the outlet end.

d. Overtopping Potential. The principal spillway is too small to pass the probable maximum flood or the 100-year flood without overtopping. The crest of the emergency spillway is above the low point on the dam. The principal spillway will pass 15% of the PMF and also the 10-year flood without overtopping of the dam. The dam could probably stand significant overtopping without serious damage. The results of the routings through the dam are tabulated below.

</tbody>
</table>

According to the recommended guidelines from the Department of the Army, Office of the Chief of Engineers, this dam is classified as having a high hazard rating and an intermediate size. Therefore, the PMF is the test for the adequacy of the dam and its spillway.

The estimated damage zone is described in Paragraph 1.2d in this report.
6.1 EVALUATION OF STRUCTURAL STABILITY

a. Visual Observation. This dam appears to be structurally stable. The embankment slopes and dimensions should provide adequate safety against shear failures. The present seepage through the abutments does not appear to significantly affect the structural integrity of the dam but could ultimately cause adverse effects by saturating the downstream toe sections of the embankment, unless it is collected and controlled by drains.

The effects of overtopping are not known but would appear to be minimal on structure stability.

b. Design and Construction Data. No design or construction data were available. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency. These seepage and stability analyses should be performed for appropriate loading conditions (including earthquake loads) and made a matter of record.

c. Operating Records. There are no controlled operating facilities for this dam.

d. Post Construction Changes. The inspection team is not aware of any post construction changes.

e. Seismic Stability. This dam is located in Seismic Zone 1. An earthquake of the magnitude predicted in this area is not expected to cause structural failure of this dam.
SECTION 7 - ASSESSMENT/REMEDIAL MEASURES

7.1 DAM ASSESSMENT

a. Safety. There does not appear to be any serious potential of failure of this structure. The approximate analyses presented in Section 5 of this report indicate that the 100-year storm occurrence will overtop the dam by 0.3 feet for about 9 hours and 50 percent of the Probable Maximum Flood will overtop the dam by 2.0 feet for about 11 hours. Additional studies would be required to determine the actual potential for overtopping and the adverse effects of such overtopping. The present seepage through the abutments does not appear to significantly affect the structural integrity of the dam but could ultimately cause adverse effects by saturating the downstream toe sections of the embankment unless it is collected and controlled by drains.

Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency. Deficiencies in maintenance of this structure, which include tree growth on the embankment and blockages in the emergency spillway control section and the principal spillway riser could ultimately lead to potential of failure if left uncontrolled.

b. Adequacy of Information. Due to the lack of engineering data, the conclusions in this report are based upon performance history and visual observations. Seepage and stability analyses were not available which is considered a deficiency.

c. Urgency. The recommendations in paragraph 7.2a relative to protection against overtopping should be pursued on a high priority basis. Other remedial measures recommended in paragraph 7.2 should be accomplished in the near future.

d. Necessity for Phase II. Phase II investigation is not considered necessary.

e. Seismic Stability. This dam is located in Seismic Zone I. An earthquake of this magnitude is not expected to be hazardous to this dam but stability analyses should include the appropriate earthquake loading.
7.2 REMEDIAL MEASURES

a. Overtopping and Stability

1. Additional information should be obtained on the topographic characteristics of the reservoir to determine the actual potential of overtopping the dam and to determine the corrective measures required to minimize or eliminate this potential. Corrective measures to be considered should include the following:

   (a) Provide a uniform crest elevation of 616+ which would be approximately two feet above the present low section of the dam.

   (b) Lower the crest and/or increase the cross section of the existing emergency spillway to provide capacity to pass the Probable Maximum Flood.

2. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams", including appropriate earthquake loadings, should be performed.

3. Seepage discharge in both abutment troughs should be collected and controlled by means of properly designed drains. Discharge from the drains should be monitored for quantity and clarity.

4. The services of an engineer experienced in the design and construction of earth dams should be obtained to perform the above analyses and to design the corrective measures, as required.

b. O & M Procedures

1. The principal spillway should be opened up and measures (trash rack) installed to prevent recurrence of plugging.

2. Obstructions in the emergency spillway should be removed and measures taken to keep the channel open.

3. The small trees and shrubs should be removed from the downstream slope of the dam and measures taken to prevent recurrence of growth.

PLATE C-2
APPENDIX D
HYDRAULIC AND HYDROLOGIC DATA
HYDROLOGIC COMPUTATIONS

1. The SCS dimensionless unit hydrograph and the systemized computer program HEC-1 (Dam Safety Version), July 1978, prepared by the Hydrologic Engineering Center, U.S. Corps of Engineers, Davis, California, were used to develop the inflow hydrographs.

   a. Twenty-four hour, 100-year rainfall for the dam location was taken from the data for the rainfall station at Jefferson City, Mo. as supplied by the St. Louis District, Corps of Engineers per their letter dated 6 March 1979. The twenty-four hour probable maximum precipitation was taken from the curves of Hydrometerological Report No. 33 and current Corps of Engineers and St. Louis policy and guidance for hydraulics and hydrology.

   b. Drainage area = 0.93 square miles (597 acres).

   c. Time of concentration of runoff = 25 minutes (computed from "Kirpich" formula).

   d. The antecedent storm conditions for the probable maximum precipitation were heavy rainfall and low temperatures which occurred on the previous 5 days (SCS AMC III). The antecedent storm conditions for the 100-year precipitation were an average of the conditions which have preceded the occurrence of the maximum annual flood on numerous watersheds (SCS AMC II). The initial pool elevation was assumed at the principal spillway crest.

   e. The total twenty-four hour storm duration losses for the 100-year storm were 2.90 inches. The total losses for the PMF storm were 1.58 inches. These data are based on SCS runoff curve No. 88 and No. 75 for antecedent moisture conditions, SCS AMC III and AMC II respectively. The watershed is composed of primarily SCS soil group C and D (Freeburg silt loam, Winfield and Steep Stony Land) and consists mostly of grassland and woodland.

   f. Average soil loss rate = 0.07 inch per hour for the PMF.

2. The discharge rating for the emergency spillway was developed using the Corps of Engineers Surface Water Profile HEC-2 computer program.

The discharge rating curve for the principal spillway was developed using the weir equation \( Q=CLH^{3/2} \) (\( C=3.1, L=6.24 \text{ ft} \) and \( H=0.0 \text{ ft. to 0.6 ft.} \)), the orifice flow equation \( Q=CA(2gH)^{1/2} \) (\( C_c=0.52, A=3.14 \text{ ft.}^2 \) and \( H=0.6 \text{ ft. to 1.1 ft.} \)) and the Bernoulli energy equation for full flow.
The discharge rating curve for flow over the dam crest was developed using the HEC-1 (Dam Safety Version) program.

Flow over the dam was computed using the HEC-1 option for non-level dam crests (cards $L$ and $V$). This option accounts for the fact that the dam crest is not level by dividing the crest into rectangular and trapezoidal sections and computing critical flow through each section. The weir coefficient shown in the output is not used in the computations.

3. Floods were routed through the reservoir using the HEC-1 (Dam Safety Version) program. The input, output, and plotted hydrographs are included in this Appendix.
