Phase I Dam Inspection Report
National Dam Safety Program
Grisham Lake Dam (MO 31574)
Howell County, Missouri

Anderson Engineering, Inc.

U.S. Army Engineer District, St. Louis
Dam Inventory and Inspection Section, LMSED-PD
210 Tucker Blvd., North, St. Louis, Mo. 63101

Approved for release; distribution unlimited.

This report was prepared under the National Program of Inspection of Non-Federal Dams. This report assesses the general condition of the dam with respect to safety, based on available data and on visual inspection, to determine if the dam poses hazards to human life or property.
INSTRUCTIONS FOR PREPARATION OF REPORT DOCUMENTATION PAGE

RESPONSIBILITY. The controlling DoD office will be responsible for completion of the Report Documentation Page, DD Form 1473, in all technical reports prepared by or for DoD organizations.

CLASSIFICATION. Since this Report Documentation Page, DD Form 1473, is used in preparing announcements, bibliographies, and data banks, it should be unclassified if possible. If a classification is required, identify the classified items on the page by the appropriate symbol.

COMPLETION GUIDE

General. Make Blocks 1, 4, 5, 6, 7, 11, 13, 15, and 16 agree with the corresponding information on the report cover. Leave Blocks 2 and 3 blank.

Block 1. Report Number. Enter the unique alphanumeric report number shown on the cover.

Block 2. Government Accession No. Leave Blank. This space is for use by the Defense Documentation Center.

Block 3. Recipient's Catalog Number. Leave blank. This space is for the use of the report recipient to assist in future retrieval of the document.

Block 4. Title and Subtitle. Enter the title in all capital letters exactly as it appears on the publication. Titles should be unclassified whenever possible. Write out the English equivalent for Greek letters and mathematical symbols in the title (see "Abstracting Scientific and Technical Reports of Defense-sponsored RDT&E," AD-667 000). If the report has a subtitle, this subtitle should follow the main title, be separated by a comma or semicolon if appropriate, and be initially capitalized. If a publication has a title in a foreign language, translate the title into English and follow the English translation with the title in the original language. Make every effort to simplify the title before publication.

Block 5. Type of Report and Period Covered. Indicate here whether report is interim, final, etc., and, if applicable, inclusive dates of period covered, such as the life of a contract covered in a final contractor report.

Block 6. Performing Organization Report Number. Only numbers other than the official report number shown in Block 1, such as series numbers for in-house reports or a contractor/grantee number assigned by him, will be placed in this space. If no such numbers are used, leave this space blank.

Block 7. Author(s). Include corresponding information from the report cover. Give the name(s) of the author(s) in conventional order (for example, John R. Doe or, if author prefers, J. Robert Doe). In addition, list the affiliation of an author if it differs from that of the performing organization.

Block 8. Contract or Grant Number(s). For a contractor or grantee report, enter the complete contract or grant number(s) under which the work reported was accomplished. Leave blank in in-house reports.

Block 9. Performing Organization Name and Address. For in-house reports enter the name and address, including office symbol, of performing activity. For contractor or grantee reports enter the name and address of the contractor or grantee who prepared the report and identify the appropriate corporate division, school, laboratory, etc., of the author. List city, state, and ZIP Code.

Block 10. Program Element, Project, Task Area, and Work Unit Numbers. Enter here the number code from the applicable Department of Defense form, such as the DD Form 1498, "Research and Technology Work Unit Summary" or the DD Form 1634, "Research and Development Planning Summary," which identifies the program element, project, task area, and work unit or equivalent under which the work was authorized.

Block 11. Controlling Office Name and Address. Enter the full, official name and address, including office symbol, of the controlling office. (Equates to funding/sponsoring agency. For definition see DoD Directive 5200.20, "Distribution Statements on Technical Documents.")

Block 12. Report Date. Enter here the day, month, and year or month and year as shown on the cover.

Block 13. Number of Pages. Enter the total number of pages.

Block 14. Monitoring Agency Name and Address (if different from Controlling Office). For use when the controlling or funding office does not directly administer a project, contract, or grant, but delegates the administrative responsibility to another organization.

Block 18. Supplementary Notes. Enter information not included elsewhere but useful, such as: Prepared in cooperation with...

Block 19. Key Words. Select terms or short phrases that identify the principal subjects covered in the report, and are sufficiently specific and precise to be used as index entries for cataloging, conforming to standard terminology. The DoD "Thesaurus of Engineering and Scientific Terms" (TEST), AD-672 000, can be helpful.

Block 20. Abstract. The abstract should be a brief (not to exceed 200 words) factual summary of the most significant information contained in the report. If possible, the abstract of a classified report should be unclassified and the abstract of an unclassified report should consist of publicly-releasable information. If the report contains a significant bibliography or literature survey, mention it here. For information on preparing abstracts see "Abstracting Scientific and Technical Reports of Defense-Sponsored RDT&E," AD-667 000.

SUBJECT: Grisham Lake Dam
Howell County, Missouri
Missouri Inventory No. 31574

This report presents the results of field inspection and evaluation of the Grisham Lake Dam. It was prepared under the National Program of Inspection of Non-Federal Dams.

a. Dam inspected under this program.

b. Dam is not performing as a dam as it had in the past.

c. Should it hold water and function as a dam at some future time, the spillway is seriously inadequate because it will not pass 50 percent of the Probable Maximum Flood without overtopping the dam.

PHASE I INSPECTION REPORT
NATIONAL DAM SAFETY PROGRAM

Prepared By
Anderson Engineering, Inc., Springfield, Missouri
Hanson Engineers, Inc., Springfield, Illinois

Under Direction Of
St. Louis District, Corps of Engineers

For
Governor of Missouri

AUGUST, 1980
Grisham Lake Dam was inspected by an interdisciplinary team of engineers from Anderson Engineering, Inc. of Springfield, Missouri and Hanson Engineers, Inc. of Springfield, Illinois. The purpose of this inspection was to make an assessment of the general condition of the dam with respect to safety, based upon available data and visual inspection, in order to determine if the dam poses hazards to human life or property.

The guidelines used in the assessment were furnished by the Department of the Army, Office of the Chief of Engineers, and they have been developed with the help of several Federal and State agencies, professional engineering organizations, and private engineers. Based on these guidelines, the St. Louis District, Corps of Engineers has determined that this dam is in the high hazard potential classification, which means that loss of life and appreciable property loss could occur if the dam fails. The estimated damage zone extends approximately three miles downstream of the dam. Located within this zone are 24 dwellings, commerce and residential buildings and Highway 17 (barrier), all in the City of West Plains.

The dam is in the small size classification, since it is less than 40 ft high, and the maximum storage capacity is greater than 50 ac-ft but less than 1,000 ac-ft.

Our inspection and evaluation indicates that the spillway does not meet the criteria set forth in the guidelines for a dam having the above size and hazard potential. The spillway will pass 22 percent of the Probable Maximum Flood without overtopping. The Probable Maximum Flood is defined as the flood discharge that may be expected from the most severe combination of critical meteorologic and hydrologic conditions that are reasonably possible in the region. The guidelines require that a dam of small size with a high downstream hazard potential pass 50 to 100 percent of the PMF. Considering the height of the dam (25 feet), the maximum storage capacity (179 acre-feet) and the small volume of permanent water storage, 50 percent of the PMF has been determined to be the
appropriate spillway design flood. The 100-year flood (1 percent probability flood) will not overtop the dam. The 1 percent probability flood is one that has a 1 percent chance of being equaled or exceeded in any given year.

The embankment appears to be in good condition. Deficiencies visually observed by the inspection team were: (1) Few small trees on upstream face of embankment; (2) very dense brush and tree growth on downstream face of embankment; (3) lack of wave protection for upstream face of embankment; (4) minimal elevation difference between the spillway crest and the low point of the dam crest; and (5) lack of a non-erodible spillway control section.

Another deficiency was the lack of seepage and stability analysis records.

It is recommended that the owners take the necessary action without undue delay to correct the deficiencies reported herein. A detailed discussion of these deficiencies is included in the following report.

SECTION 1 - PROJECT INFORMATION

1.1 GENERAL:

A. Authority:

The National Dam Inspection Act, Public Law 92-367, authorized the Secretary of the Army, through the Corps of Engineers, to initiate a program of safety inspection of dams throughout the United States. Pursuant to the above, the St. Louis District, Corps of Engineers, District Engineer directed that a safety inspection be made of Grisham Lake Dam in Howell County, Missouri.

B. Purpose of Inspection:

The purpose of the inspection was to make an assessment of the general condition of the dam with respect to safety, based upon available data and a visual inspection in order to determine if the dam poses hazards to human life or property.

C. Evaluation Criteria:

Criteria used to evaluate the dam were furnished by the Department of the Army, Office of the Chief of Engineers, "Recommended Guidelines for Safety Inspection of Dams, Appendix D." These guidelines were developed with the help of several federal agencies and many state agencies, professional engineering organizations, and private engineers.

1.2 DESCRIPTION OF PROJECT:

A. Description of Dam and Appurtenances:

Grisham Lake Dam is an earth fill structure approximately 25 ft high and 765 ft long at the crest. The appurtenant works consists of an earth cut swale spillway at the north abutment.

Sheet 3 of Appendix A shows a plan, profile, and typical section of the embankment.

B. Location:

The dam is located in the central part of Howell County, Missouri on a tributary of Howell Creek. The dam and lake are within the West Plains, Missouri 15 minute quadrangle sheet (Section 13, T24N, R09W - latitude 36°44.8'; longitude 91°53.8'). Sheet 2 of Appendix A shows the general vicinity.

C. Size Classification:

With an embankment height of 25 ft and a maximum storage capacity of approximately 179 acre-ft, the dam is in the small size category.
D. Hazard Classification:

The St. Louis District, Corps of Engineers has classified this dam as a high hazard dam. The estimated damage zone extends approximately three miles downstream of the dam. Located within this zone are 24 dwellings, commerce and residential buildings and Highway 17 (barrier), all in the City of West Plains. Photograph number 12 of Appendix D shows a portion of the dwellings in the estimated damage zone. The affected features within the damage zone were verified by the inspection team.

E. Ownership:

The dam is owned by Mr. G. E. Grisham. The owner's address is 213 E. Main Street, West Plains, Missouri (Telephone number 417/256-7159).

F. Purpose of Dam:

The dam was constructed primarily for lakeside home development.

G. Design and Construction History:

There are no plans or design calculations available for this dam. The dam was constructed in 1964 by Mr. E. T. Stokes of West Plains, Missouri. Mr. Stokes, an equipment dealer, constructed the dam with his own equipment and personnel. The lake was to have approximately 13 acres of surface area when full.

A core trench 10 feet wide and 6 to 10 feet deep was cut into "good clay". The material for the core was obtained from the lake area. All of the borrow for the embankment was obtained from the lake area. Mr. Stokes indicated that the material removed from the borrow site consisted of "sand and creek gravel" over clay. The core was constructed from the selected clay obtained from the borrow area.

Mr. Stokes stated that after completion of the dam, the reservoir was filling at a normal expected rate. Approximately one year after the dam was completed, a "heavy" rainfall raised the lake level to about 2 feet below the spillway. Three days after the rainfall, Mr. Stokes stated that he heard a loud noise from the vicinity of the dam. When he arrived at the dam site, he stated that he heard the sound of "rushing water". He did not observe any flow of surface water downstream of the dam. Seven hours after the loud noise, Mr. Stokes stated that the reservoir area was dry.

During the period of time that the water was draining, no apparent surface flow was observed downstream of the dam.

An area near the south abutment, believed to be the failure area, was excavated to a depth of 15 to 20 feet. A large crevice
was detected in the bedrock. After cleaning out the crevice area, 40 cubic yards of concrete were placed in and around the crevice. Clays obtained from the lake bed were then placed and compacted in the excavated area.

Mr. Stokes indicated that subsequent to the repair work, the dam has never held water. No additional repairs or modifications have been made to the dam.

H. Normal Operating Procedures:

All flows will be passed by the uncontrolled earth cut swale spillway at the north abutment. Information obtained from Mr. Stokes and Mr. Grisham indicates that the dam has never been overtopped.

1.3 PERTINENT DATA:

Pertinent data about the dam, appurtenant works, and reservoir are presented in the following paragraphs. Sheet 3 of Appendix A presents a plan, profile, and typical section of the embankment.

A. Drainage Area:

The drainage area for this dam, as obtained from the U.S.G.S. quad sheet, is approximately 168 acres.

B. Discharge at Dam Site:

(1) All discharge at the dam site is through an uncontrolled spillway.

(2) Estimated Total Spillway Capacity at Maximum Pool (Top of Dam - El. 1070): 5 cfs

(3) Estimated Capacity of Principal Spillway: 5 cfs

(4) Estimated Experience Maximum Flood at Dam Site: Spillway section has not been used; maximum reservoir elevation approximately 1068.0 feet, MSL

(5) Diversion Tunnel Low Pool Outlet at Pool Elevation: Not Applicable

(6) Diversion Tunnel Outlet at Pool Elevation: Not Applicable

(7) Gated Spillway Capacity at Pool Elevation: Not Applicable

(8) Gated Spillway Capacity at Maximum Pool Elevation: Not Applicable

C. Elevations:

All elevations are consistent with an assumed mean sea level elevation of 1074.00 for nail set in west side of 15 inch oak tree
10 feet right of Station 0 + 20, (estimated from quadrangle map).

(1) Top of Dam: 1070.0 feet, MSL (Low Point)
(2) Principal Spillway Crest: 1069.8 feet, MSL
(3) Emergency Spillway Crest: Not Applicable
(4) Principal Outlet Pipe Invert: Not Applicable
(5) Streambed at Centerline of Dam: 1048.0 feet, MSL
(6) Pool on Date of Inspection: 1048.4 feet, MSL
(7) Apparent High Water Mark: 1057.0 feet, MSL
(8) Maximum Tailwater: Not Applicable
(9) Upstream Portal Invert Diversion Tunnel: Not Applicable
(10) Downstream Portal Invert Diversion Tunnel: Not Applicable

D. Reservoir Lengths:
(1) At Top of Dam: 1,560 feet
(2) At Emergency Spillway Crest: Not Applicable
(3) At Principal Spillway Crest: 1,550 feet

E. Storage Capacities:
(1) At Top of Dam: 179 acre-feet
(2) At Emergency Spillway Crest: Not Applicable
(3) At Principal Spillway Crest: 175 acre-feet

F. Reservoir Surface Areas:
(1) At Top of Dam: 19.3 acres
(2) At Emergency Spillway Crest: Not Applicable
(3) At Principal Spillway Crest: 19 acres

G. Dam:
(1) Type: Rolled Earth
(2) Length at Crest: 765 feet
(3) Height: 25 feet
(4) Top Width: 11 feet
(5) Side Slopes: Upstream varies from 1V on 1.7H to 1V on 2.3H; Downstream varies from 1V on 3.8H to 1V on 5.8H

(6) Zoning: Apparently Homogeneous

(7) Impervious Core: None

(8) Cutoff: Key Trench to Clay

(9) Grout Curtain: None

H. Diversion and Regulating Tunnel:

(1) Type: Not Applicable

(2) Length: Not Applicable

(3) Closure: Not Applicable

(4) Access: Not Applicable

(5) Regulating Facilities: Not Applicable

I. Spillway:

I.1 Principal Spillway:

(1) Location: North Abutment

(2) Type: Earth Cut Swale

(3) Upstream Channel: Earth Cut, grass covered channel

(4) Downstream Channel: Brush and wood covered earth channel with moderate side slopes

I.2 Emergency Spillway:

(1) Location: Not Applicable

(2) Type: Not Applicable

J. Regulating Outlets:

There are no regulating facilities associated with this dam.
SECTION 2 - ENGINEERING DATA

2.1 DESIGN:

No engineering data exist for this dam. No documentations of construction records were available. There are no documented maintenance data.

A. Surveys:

No information regarding pre-construction surveys was obtained. Sheet 3 of Appendix A presents a plan, profile, and cross section of the dam from survey data obtained during the site inspection. A nail set in the west side of a 15 inch oak tree at Station 0 + 20, 10 feet right of centerline, was used as a site datum of assumed elevation 1074.0.

B. Geology and Subsurface Materials:

The topography of the site is rolling to hilly. This area is in the Ozarks geologic region of the state. Generally the soils around the dam consist of thick, well drained, residual cherty, silty clays above bedrock. Shallow auger probes in the embankment showed it to consist of cherty silt clays that were yellowish-brown in color. The soil portion appeared to be in the Unified Soil Group of CL. The underlying rock is of the Canadian series of the Ordovician system. The rocks of this series are principally arenaceous, and cherty dolomite and sandstone. The Jefferson City dolomite formation is believed to be the parent bedrock in the lake basin. The thickness of the Jefferson City formation ranges from 125 to 350 feet.

The publication "Caves of Missouri" indicates that two known caves exist in Howell County. Both caves are several miles from the site. The quad sheet for this area shows the presence of sinks in all directions from the lake basin and characterizes the residual soils.

The "Geologic Map of Missouri" indicates the nearest fault zone to be approximately 20 miles northwest of the site. The Missouri Geologic Survey has indicated that the faults in this area are generally considered to be inactive.

C. Foundation and Embankment Design:

No foundation and embankment design information was available. Seepage and stability analyses apparently were not performed as required in the guidelines. Mr. Stokes indicated that a clay core approximately 10 feet wide and 6 to 8 feet deep was incorporated into the dam and keys into a clay material. He also stated that the material for the embankment was obtained from the lake area.
D. Hydrology and Hydraulics:

No hydrologic or hydraulic design computations for this dam were available. Based on a field check of spillway dimensions, embankment elevations, and a check of the drainage area on U.S.G.S. quad sheets, hydrologic analyses using U.S. Army Corps of Engineers guidelines were performed and appear in Appendix C, Sheets 1 to 9.

E. Structures:

There are no structures associated with this dam.

2.2 CONSTRUCTION:

No construction inspection data have been obtained.

2.3 OPERATION:

Normal flows would be passed by an uncontrolled earth cut spillway located in the north abutment. No operating facilities exist.

2.4 EVALUATION:

A. Availability:

No engineering data, seepage or stability analyses, or construction test data were available.

B. Adequacy:

The engineering data available were inadequate to make a detailed assessment of the design, construction, and operation of this structure. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency. These seepage and stability analyses should be performed for appropriate loading conditions and made a matter of record.

C. Validity:

To our knowledge, no valid engineering data on the design or construction of the embankment are available.
3.1 FINDINGS:

A. General:

The field inspection was made on June 19, 1980. The inspection team consisted of personnel from Anderson Engineering, Inc. of Springfield, Missouri and Hanson Engineers, Inc. of Springfield, Illinois. The team members were:

Steve Brady - Anderson Engineering, Inc. (Civil Engineer)
Tom Beckley - Anderson Engineering, Inc. (Civil Engineer)
Dave Daniels - Hanson Engineers, Inc. (Geotechnical Engineer)
Nelson Morales - Hanson Engineers, Inc. (Hydraulic Engineer)

Photographs of the dam, appurtenant structures, reservoir, and downstream features are presented in Appendix D.

B. Dam:

The embankment appears to be in good condition. The upstream face had some scattered trees. There was no sloughing or significant erosion. There was no wave protection such as riprap for the upstream face.

The horizontal alignment was good with a gentle curve. The crest of the dam had a sag curve extending the full length of the embankment. The elevation of the crest varied from 1070.0 at the center to 1071.6 at the north end of the embankment. The elevation at the center of the embankment was 0.2 feet higher than the spillway channel.

No surface cracking or unusual movement of the embankment was obvious.

The downstream face of the embankment was densely covered with brush and trees. A thorough inspection of the downstream face was difficult due to the heavy growth. No animal burrows were observed. No sloughing or serious erosion was evident on the embankment or at the embankment-abutment contacts. The embankment and downstream valley were investigated for seepage, but none was found.

Auger probes in the crest of the embankment indicated a red-brown clayey silt with chert fragments (ML-CL).

C. Appurtenant Structures:

C.1 Principal Spillway:

The spillway is an earth cut swale in the north abutment. No significant erosion was observed in the channel. The approach
area had a scattering of brush and small trees. There is no permanent control section at the crest of the spillway. The spillway has apparently never been used. The elevation of the channel is 0.2 foot lower than the low point of the embankment.

C.2 Emergency Spillway:

There is no emergency spillway associated with this dam.

D. Reservoir:

The watershed is wooded with some pastureland. The slopes into the reservoir area are moderate. The lake was only about 0.5 acre in plan area the day of inspection. According to the builder the lake has maintained this level for all but the first year after construction. The crevice that was repaired, or other apparent crevices does not permit permanent water storage.

E. Downstream Channel:

The downstream channel is wooded for several hundred feet starting about 150 feet downstream of the toe. Some brush cover was observed at the inlet to the channel. The downstream channel slopes were light to moderate.

3.2 EVALUATION:

Trees and brush on the dam constitute a potential seepage hazard and encourage animal burrowing. There is no wave protection provided for the upstream face of the embankment. A non-erodible control section is not provided for the spillway; therefore, progressive erosion could lower the elevation of the spillway, and thus lower the normal pool elevation of the reservoir should the dam ever attain normal pool elevation. The tree and brush growth in the spillway channel could restrict flood flows.

The difference of 0.2 feet between the spillway and the low point of the crest of dam and the small capacity of the spillway indicates that overtopping is eminent should the pool level reach the spillway elevation.

As the dam has not provided permanent water storage for 15 of the 16 years of its existence, the above deficiencies are not as critical from an urgency standpoint. However, the correction of these deficiencies represents standard practice for the construction and maintenance of dams. The occurrence of a large flood could result in rapid fill up of the lake and substantially increase the risk associated with the above deficiencies.
SECTION 4 - OPERATIONAL PROCEDURES

4.1 PROCEDURES:

There are no operating facilities associated with this dam. The pool level is normally controlled by rainfall, runoff, evaporation and apparent leakage from the reservoir. Should the lake ever fill up, an additional pool level control would be the capacity of the uncontrolled spillway.

4.2 MAINTENANCE OF DAM:

The presence of tree and brush growth on the embankment indicates that minimal maintenance is done.

4.3 MAINTENANCE OF OPERATING FACILITIES:

There are no operating facilities for this dam.

4.4 DESCRIPTION OF ANY WARNING SYSTEM IN EFFECT:

The inspection team is unaware of any existing warning system for this dam.

4.5 EVALUATION:

The vegetation on the dam, lack of riprap, and a non-erodible spillway control section and the minute elevation difference between the low point of the crest of the dam and the spillway crest are deficiencies which could become serious should the dam provide permanent water storage.
5.1 EVALUATION OF FEATURES:

A. Design Data:

No hydrologic or hydraulic design computations for this dam were available.

B. Experience Data:

No recorded rainfall, runoff, discharge or reservoir stage data were available for this lake and watershed. The builder and owner indicated that the spillway has never been used. Information from the builder indicates that the highest water level in the lake was approximately 2 feet below the top of dam elevation 1068. The apparent high water mark observed by the inspection team was elevation 1056.4. Our hydrologic and hydraulic analyses using U. S. Army Corps of Engineers guidelines appear in Appendix C.

C. Visual Observations:

The approach area to the spillway has a few scattered trees and some brush. There is no non-erodible spillway control section. The spillway outlet channel is diverted away from the embankment, and spillway releases would not be expected to endanger the dam. The small difference in elevation (0.2 feet) of the spillway crest and the low point of the crest of the dam creates a potential overtopping should the dam ever provide permanent water storage.

D. Overtopping Potential:

The hydraulic and hydrologic analyses (using the U. S. Army Corps of Engineers guidelines and the HEC-1 computer program) were based on: (1) a field survey of spillway dimensions and embankment elevations; and (2) an estimate of the reservoir storage and the pool and drainage areas from the West Plains, Missouri 15 Minute U.S.G.S. quad sheet.

Based on the hydrologic and hydraulic analysis presented in Appendix C, the spillway will pass 22 percent of the Probable Maximum Flood. The Probable Maximum Flood is defined as the flood discharge that may be expected from the most severe combination of critical meteorologic and hydrologic conditions that are reasonably possible in the region. The recommended guidelines from the Department of the Army, Office of the Chief of Engineers, require that this structure (small size with high downstream hazard potential) pass 50 percent to 100 percent of the PMF, without overtopping. Considering the height of dam (25 feet), the maximum
storage capacity (179 acre-feet) and the small volume of permanent water storage, 50 percent of the PMF has been determined to be the appropriate spillway design flood. The 1 percent probability flood will be storage in the lake without spillway spilling or overtopping of the dam.

Application of the probable maximum precipitation (PMP), minus losses, resulted in flood hydrograph peak inflow of 4,020 cfs. For 50 percent of a PMF, the peak inflow was 2,010 cfs.

The routing of the PMF through the spillway and dam indicates that the dam will be overtopped by 1.9 feet at elevation 1071.9. The duration of the overtopping will be 18.5 hours, and the maximum outflow will be 3,405 cfs. The maximum discharge capacity of the spillway is 5 cfs. The routing of 50 percent of the PMF indicates that the dam will be overtopped by 1.3 feet at elevation 1071.3. The maximum outflow will be 1,584 cfs, and the duration of overtopping will be 12.0 hours. Overtopping of an earthen embankment could cause serious erosion and could possibly lead to failure of the structure.
SECTION 6 - STRUCTURAL STABILITY

6.1 EVALUATION OF STRUCTURAL STABILITY:

A. Visual Observations:

Observed features which could adversely affect the structural stability of this dam are discussed in Sections 3.1B and 3.2.

B. Design and Construction Data:

No design and construction data for the foundations and embankment were available.

Seepage and stability analyses comparable to the requirements of the guidelines were not available, which constitutes a deficiency which should be rectified.

C. Operating Records:

No operating records have been obtained.

D. Post-Construction Changes:

The only post-construction changes that have been done to the dam are the reported repair to the lake bed by excavating and concreting the apparent failed area.

E. Seismic Stability:

The structure is located in seismic zone 1. An earthquake of this magnitude would not generally be expected to cause severe structural damage to a well constructed earth dam of this size.
SECTION 7 - ASSESSMENT/REMEDIAL MEASURES

7.1 DAM ASSESSMENT:

This Phase I inspection and evaluation should not be considered as being comprehensive since the scope of work contracted for is far less detailed than would be required for an in-depth evaluation of dams. Latent deficiencies, which might be detected by a totally comprehensive investigation, could exist.

A. Safety:

The embankment is generally in good condition. Several items were noted during the visual inspection which should be investigated further, corrected or controlled. These items are: (1) few small trees on the upstream face of embankment; (2) very dense brush and trees on downstream face of embankment; (3) lack of wave protection for upstream face of embankment; and (4) minimal elevation difference between the spillway crest and the low point of the dam crest.

Another deficiency was the lack of seepage and stability analyses records.

The dam will be overtopped by flows in excess of 22 percent of the Probable Maximum Flood. Overtopping of an earthen embankment could cause serious erosion and could possibly lead to failure of the structure.

B. Adequacy of Information:

The conclusions in this report were based on the performance history as related by others, and visual observation of external conditions. The inspection team considers that these data are sufficient to support the conclusions herein. Seepage and stability analyses comparable to the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency.

C. Urgency:

The remedial measures recommended in paragraph 7.2 should be accomplished in the near future. If the deficiencies listed in paragraph A are not corrected, and if good maintenance is not provided, the embankment condition will continue to deteriorate and possibly could become serious in the future. The items recommended in paragraph 7.2A should be pursued without undue delay.

D. Necessity for Additional Inspection:

Based on the result of the Phase I inspection, no additional inspection is recommended.

- 14 -
E. Seismic Stability:

The structure is located in seismic zone 1. An earthquake of this magnitude would not generally be expected to cause severe structural damage to a well constructed earth dam of this size.

7.2 REMEDIAL MEASURES:

The following remedial measures and maintenance procedures are recommended. All remedial measures should be performed under the guidance of a professional engineer experienced in the design and construction of dams.

A. Alternatives:

(1) Spillway size and/or height of dam should be increased to pass 50 percent of the PMF. In either case, the spillway should be protected to prevent erosion.

B. O & M Procedures:

(1) Seepage and stability analyses comparable to the requirements of the recommended guidelines should be performed by an engineer experienced in the construction of dams.

(2) A non-erodible spillway control section should be provided so that progressive erosion of the spillway would not lower the normal pool of the reservoir.

(3) The vertical alignment of the crest of the dam should be improved to provide a greater elevation difference between the spillway and dam crest to limit the overtopping potential.

(4) Wave protection should be provided for the upstream face of the dam.

(5) Brush and tree growth should be removed from the embankment and the spillway channel. This should be done under the guidance of a professional engineer experienced in the design and construction of dams. Indiscriminate clearing methods could jeopardize the safety of the dam.

(6) A detailed inspection of the dam should be made periodically by an engineer experienced in the design and construction of dams.

Overtopping Analysis
APPENDIX C

HYDROLOGIC AND HYDRAULIC ANALYSIS

To determine the overtopping potential, flood routings were performed by applying the Probable Maximum Precipitation (PMP) to a synthetic unit hydrograph to develop the inflow hydrograph. The inflow hydrograph was then routed through the reservoir and spillway. The overtopping analysis was accomplished using the systemized computer program HEC-1 (Dam Safety Version), July 1978, prepared by the Hydrologic Engineering Center, U.S. Army Corps of Engineers, Davis, California.

The PMP was determined from regional charts prepared by the National Weather Service in "Hydrometeorological Report No. 33." Reduction factors were not applied. The rainfall distribution for the 24-hour PMP storm duration was assumed according to the procedures outlined in EM 1110-2-1411 (SPD Determination). Also, the 1 percent chance probability flood was routed through the reservoir and spillway. Doniphan rainfall distribution (5 min. interval - 24 hours duration), as provided by the St. Louis District, Corps of Engineers, was used in this case.

The synthetic unit hydrograph for the watershed was developed by the computer program using the SCS method. The parameters for the unit hydrograph are shown in Table 1 (Sheet 4, Appendix C).

The SCS curve number (CN) method was used in computing the infiltration losses for rainfall-runoff relationship. The CN values used, and the result from the computer output, are shown in Table 2 (Sheet 5, Appendix C).

The reservoir routing was accomplished by using the Modified Pulse Method. The hydraulic capacity of the spillway was used as an outlet control in the routing. The hydraulic capacity of the spillway and the storage capacity of the reservoir were defined by the elevation-surface area-storage-discharge relationships shown in Table 3 (Sheet 5, Appendix C).

The reservoir of this dam has never been filled. To consider the effect of the reservoir storage in the routing, an antecedent storm of 25 percent and 50 percent of the PMF was considered assuming the reservoir at elevation 1,057.0 (mean annual high water) to determine the starting reservoir elevation for the routing of 50 percent and 100 percent of the PMF respectively. The 25 percent PMF reached elevation 1,066.8. The 50 percent PMF overtopped the dam. These antecedent storms were assumed to occur four days prior to the corresponding storm. There are no outlet works or dewatering structures in this dam. Thus, the final routing analysis was accomplished starting at the spillway crest elevation (1,069.8) for the PMF, and at elevation 1,066.8 for the 50 percent PMF storm.

The percentage of the PMF that will reach the top of the dam was determined to be 22 percent. An antecedent storm of half this magnitude (11 percent) was considered. In this case, the starting reservoir elevation was 1,062.13.

Sheet 2, Appendix C
For the routing of the 1 percent probability flood, the antecedent storm was assumed to be equivalent to 1 in. of runoff. The corresponding reservoir level (1,059.0) was used as the starting reservoir elevation.

The rating curve for the spillway (see Table 4, Sheet 6, Appendix C) was determined assuming critical flow conditions at the control section.

The flow over the crest of the dam during overtopping was determined using the non-level dam option ($L$ and $V$ cards) of the HEC-1 program. The program assumes critical flow over a broad-crested weir.

A summary of the routing analysis for different ratios of the PMF is shown in Table 5 (Sheet 7, Appendix C).

The computer input data and a summary of the output data for the antecedent storms, the PMF and the PMF ratios, are presented on Sheets 8 through 18 of Appendix C. A plot of the inflow-outflow hydrograph for the PMF is shown on Sheet 12, Appendix C.
