**20. ABSTRACT (Continue on reverse side if necessary and identify by block number)**

The primary dermal irritation potential of components of the Prototype M-258A-1 Decontamination Kit was assessed by using a modified Draize test. The test called for applying the components as they are intended to be applied under field conditions. Approximately 0.03 to 0.1 g of test substance was applied per dose site. Decon I and Decon I and II when applied together, caused moderate irritation after exposure and occlusion for 24 hours. Decon II caused mild irritation after exposure and occlusion for 24 hours.

Primary Dermal Irritation GLP Study Report

TESTING FACILITY: Letterman Army Institute of Research
Presidio of San Francisco, CA 94129

SPONSOR: Letterman Army Institute of Research
Presidio of San Francisco, CA 94129

PROJECT: Medical Defense Against Chemical Agents 612772.875.

GLP STUDY NUMBER: 81021

STUDY DIRECTOR: LTC (P) John T. Fruin, DVM, PhD, VC, Diplomate of American College of Veterinary Preventive Medicine

PRINCIPAL INVESTIGATOR: CPT Martha A. Hanes, DVM, VC

RAW DATA: A copy of the final report, study protocol, raw data, and standard operating procedures will be retained in the LAIR Archives.

TEST SUBSTANCES:

A. Decon I, consisting of a pad pre-wetted with hydroxyethane (ethanol) 72 ± 2% phenol 10 ± 0.5%, sodium hydroxide 5 ± 0.5%, ammonium hydroxide 0.2 ± 0.05% and water was used to wipe the back of rabbits for 1 minute.

B. Decon II, consisting of a pad impregnated with a quantity of crystalline chloramine B and an equal quantity of liquid contained in breakable glass ampoules covered with nylon mesh. The liquid contains hydroxyethane (ethanol) 45 ± 2%, zinc chloride 5±0.5% and water. Just prior to dosing, the ampoules were broken and thus the chloramine B impregnated pad was saturated with liquid. Decon II was used to wipe the backs of rabbits for 2-3 min.

C. Decon I and Decon II were used to wipe the same area of the back for 1 and 2-3 minutes, respectively.

D. Control (no treatment)

WORK UNIT: 302 Studies on Potential Dermal Irritation of M-258A-1 Kit

PURPOSE: The purpose of this study was to determine the primary dermal irritation potential of the test substance used as listed above.
ACKNOWLEDGMENTS

The authors wish to thank LTC Kenneth Black MD, MC; SP5 Lance White; SP4 Thomas Kallner, BS; PFC Evelyn Zimmerman; Carolyn Lewis, MS; for assistance in performing the research, and for advice in scoring the irritation reactions. The authors also wish to thank M. Mershon, VMD; LTC (P) E. Houston, PhD, MS; LTC R. Howarth, VMD, VC, of the U.S. Army Medical Research Institute of Chemical Defense, Aberdeen Proving Grounds, MD, for providing prototype M-258A-1 Decontamination Kits and background information.
Signatures of Principal Scientists Involved
In The Study

We, the undersigned, believe the study, GLP Study number 81021, described in this report to be scientifically sound and the results and interpretation to be valid. The study was conducted to comply, to the best of our ability, with the Good Laboratory Practice Regulations for Nonclinical Laboratory Studies outlined by the Food and Drug Administration.

MEMORANDUM FOR RECORD

SUBJECT: Report of GLP Compliance

I hereby certify that in relation to LAIR GLP study 81021 the following inspections were made:

11 June 1981
16 June 1981
19 June 1981

Routine inspections with no adverse findings are reported quarterly, thus these inspections are also included in the July 1981 report to management and the Study Director.

John C. Johnson
CPT, MS
Quality Assurance Officer
An evaluation of the Prototype M-258A-1 Decontamination Kit for primary dermal irritation potential by using the modified Draize test (1) was recently completed (2). That evaluation using the standard method to apply the test compound produced evidence of severe irritation potential. Further testing was determined to be necessary to determine the kit's irritation potential under conditions of proposed field usage.

Deviation from standards

Rather than applying liquid test substance on gauze, liquid impregnated pads from the M-258A-1 Decontamination Kit were cut into approximately one inch squares. Decon I squares were used to wipe the test area on the backs of rabbits for 1 minute. Decon II squares were used similarly, except the wiping was for 2 minutes. For Decon I plus Decon II the test site was first wiped for 1 minute with Decon I and then for 2 minutes with Decon II.

In addition, the exposure sites were not bandaged as specified in SOP-OP-STX-34. Chemical analyses were not conducted except for measuring pH. The pH of Decon I was 10.7 - 10.8, Decon II was 6.5 - 6.6 and combined Decon I and II was 10.6 - 10.7. Chemical composition was considered to be that printed on the outer container for the prototype M-258A-1 Decontamination Kit (Table 1 and 2). The compound was assumed to be stable under conditions of storage and use. Compound purity was unknown.

* Equal quantities of liquid and solid are mixed to form Decon II.

**Objective of Study**

The objective of this study was to determine the primary dermal irritation potential of the Prototype H-258A-1 Decontamination Kit as it is expected to be used in the field.
METHODS

Historical Listing of Study Events

11 June 1981 Animals were weighed and sites for exposure were randomized.
15 June 1981 Animals were close clipped and areas marked.
16 June 1981 Animals were weighed and dosed.
16-30 June 1981 Animals were observed daily, only significant or abnormal observations were recorded.
17 June 1981 Bandages removed, 24-hr postexposure score.
19 June 1981 72-hr postexposure score.
23 June 1981 7-day postexposure score, weight taken.
30 June 1981 Animals were scored, (14 day after exposure) and weights taken. Animals were removed from the study.

Animal Data

Animal: New Zealand White Rabbits
Sex: Female
Source: Elkhorn Rabbitry

Pre-test Conditioning:

A. Transferred from Clinical Investigation, and had not been on study

B. Animals were close clipped and test areas marked

Method of Randomization: Manual, Latin Square, SOP-OP-STX-34

Number of Animals on test: 6 animals - each animal had 4 test sites and received each of the three test treatments and a control with no treatment

Age of animals at start of study: young adults
Body Weight Range: 3–4 kg

Condition of animals at start of study: normal

Identification System: Ear marked as per SOP-OP-AGR-1

Environmental Conditions

Caging: Number/cage = 1; Type cage used = stainless steel, wire mesh bottom, battery type, no bedding, automatic flushing

Diet: Purina Certified Rabbit Chow 5322 approximately 110 g per day supplemented with about 45 g of fresh carrots

Water: Central line to cage battery with automatic lick dispensers

Temperature: 70 ± 5 F (21 ± 3 C)

Relative Humidity: 50 ± 10%

Photoperiod: 0530 – 2000 hr/day (14 1/2 hr of light)

Dosing Levels

A. Approximately 0.03–0.1 g Decon I
B. Approximately 0.03–0.1 g Decon II
C. Approximately 0.03–0.1 g and 0.3–0.1 g of Decon I and Decon II respectively.
D. Control: Nothing was applied.

Dosing Procedures

Method and frequency of administration were dictated by SOP-OP-STX-34. The backs of the animals were close clipped and divided into quadrants designated I, II, III and IV (SOP-OP-STX-34). Areas I and IV were intact on all animals, and areas II and III were abraded by making two perpendicular scratches in the stratum corneum of the skin about 1 1/2 inch long by using an escarifier. The four application sites were about 10 cm apart. A standard latin square table was used to randomize the test sites (SOP-OP-STX-34). The test substance impregnated pads were wiped over the test sites for 1, 2 and 3 minutes (see deviation to standards). An Elizabethan collar was placed around each animal's neck to keep animals from self-mutilating the treatment sites.
RESULTS

Scoring

Six animals were exposed to the chemicals. Animals were scored at 24 and 72 hr, 7 and 14 days for edema/erythema (Table 3). Tabular data appear in Appendix A. Abraded areas (sites II and III) and intact areas (sites I and IV) were graded separately as well as together. The scores obtained were used for a basis for categorization. Primary irritation potential values were calculated from the 24-and 72-hr scores.

* Any skin reaction more serious than severe erythema, severe edema, vesiculation, ulceration, or necrosis places the chemical in Category IV.
Compounds producing combined averages (intact and abraded scores) of 0.51-2 are considered mildly irritating (Category II), if the intact score is greater than 0.5, whereas those with indexes from 2 to 5 are moderate irritants (Category III). (Category assignment and interpretation, A.H. McCreesh, 1980, personnel communication).

Category IV irritants are compounds producing moderate to severe primary irritation of intact skin surrounding an abrasion. In addition, these compounds produce necrosis, vesiculation, ulceration and/or eschars. (Category assignment and interpretation, A.H. McCreesh, personnel communication, 1980.) Table 4 demonstrates the primary irritation indexes for the exposed areas.

</tbody>
</table>

**DISCUSSION**

Decon I, Decon II, and Decon I+II showed moderate irritation potential. Decon II showed mild irritation. The irritation demonstrated by this test was much less than demonstrated previously by the standard test (2).
CONCLUSIONS

The modified Draize test presented here may provide more accurate data concerning the potential hazard of the M-258A-1 Decontamination Kit to the soldier in the field.

RECOMMENDATIONS

Recommendations will be made after the current series of studies is completed.
