TOPICAL HAZARD EVALUATION PROGRAM
OF CANDIDATE INSECT REPELLENT AI3-38017
US DEPARTMENT OF AGRICULTURE PROPRIETARY CHEMICAL
STUDY NO. 75-51-0246-82
NOVEMBER 1979 - JANUARY 1982

Approved for public release, distribution unlimited.
**Title:** Topical Hazard Evaluation Program of Candidate Insect Repellent, A13-38017

**Authors:** Michael J. Topper, CPT, VC
John G. Harvey, Jr.

**Performing Organization:** US Army Environmental Hygiene Agency, Aberdeen Proving Ground, MD 21010

**Report Date:** Nov 79 - Jan 82

**Contract or Grant Number:** Study No. 75-51-0246-82

**Distribution Statement:** Approved for public release; distribution unlimited.

**Abstract:** Preliminary hazard evaluation of A13-38017 was performed by means of laboratory animal studies using rats, rabbits, and guinea pigs. The technical grade chemical caused mild injury to the cornea, and in addition, some injury to the conjunctiva of rabbits. A13-38017 did not cause skin or photo-irritation. It did not prove to be a skin sensitizer or to be acutely toxic by ingestion. It was recommended that A13-38017 be approved for further testing as a candidate insect repellent.
SUBJECT: Topical Hazard Evaluation Program of Candidate Insect Repellent A13-38017, US Department of Agriculture Proprietary Chemical, Study Number 75-51-0246-82, November 1979 - January 1982

Executive Secretary

Washington, DC 20012

A summary of the pertinent findings and recommendations of the inclosed report follows:

Preliminary hazard evaluation of A13-38017 was performed by means of laboratory animal studies using rats, rabbits, and guinea pigs. The technical grade chemical caused mild injury to the cornea, and in addition some injury to the conjunctiva of rabbits. A13-38017 did not cause skin or photoirritation. It did not prove to be a skin sensitizer or to be acutely toxic by ingestion. It is recommended that A13-38017 be approved for further testing as a candidate insect repellent.

b. Memorandum of Understanding between the US Army Environmental Hygiene Agency; the US Army Health Services Command; the Department of the Army, Office of The Surgeon General; the Armed Forces Pest Control Board; and the US Department of Agriculture, Agricultural Research, Science and Education Administrations; titled, Coordination of Biological and Toxicological Testing of Pesticides, effective 23 January 1979.

2. REFERENCE. Toxicology Division Standing Operating Procedures, US Army Environmental Hygiene Agency (USAHAE), 1981.

3. PURPOSE. The purpose of this program is to provide guidance for further entomological testing of the candidate insect repellent A13-38017.

4. SUMMARY OF FINDINGS. Hazard evaluation of the candidate repellent A13-38017, US Department of Agriculture (USDA) Proprietary Chemical was conducted by this Agency using New Zealand White rabbits for skin and eye studies, Hartley guinea pigs for a skin sensitization study and Sprague-Dawley rats for determination of oral toxicity. A tabular presentation of animal toxicity data developed in this Agency follows:

* In conducting the studies described in this report, the investigators adhered to the "Guide for the Care and Use of Laboratory Animals," US Department of Health, Education and Welfare Publication No. (NIH) 80-23, revised 1978.

† The studies reported herein were performed in animal facilities fully accredited by the American Association for the Accreditation of Laboratory Animal Care.

Approved for public release, distribution unlimited.

**PHOTOCHEMICAL SKIN IRRITATION STUDIES**

**Rabbits**

A single 0.05 mL application of a 25 percent (w/v) solution of each chemical and a 10 percent (w/v) Oil of Bergamot solution (positive control) in 95 percent ethyl alcohol were applied to the intact skin of six rabbits. Five minutes after application, the rabbits were exposed to UV light (365 nm) for 30 minutes at a distance of 10-15 cm.

**Control**

Following UV exposures of the rabbits, 0.05 mL of test chemical, positive control and diluent were applied to additional skin areas to serve as unirradiated control sites. Application areas were checked for skin irritation at 24, 48 and 72 hours.

**SENSITIZATION STUDIES**

**Guinea Pigs (Male)**

Intradermal injections of 0.1 mL of a 0.1 percent solution (w/v) of AI3-38017 or of dinitrochlorobenzene (DNCB)* in a mixture containing 1 volume of propylene glycol and 29 volumes of saline.

Ten test guinea pigs for each chemical were given 10 sensitizing doses over a 3-week period. After 2-weeks rest, they were challenged with ID injections of each test compound.

Ten positive control guinea pigs were sensitized over 3 weeks with DNCB. After 2-weeks rest, they were challenged with ID injections of DNCB.

| Challenge doses of AI3-38017 did not produce a sensitization reaction. |
| Chemical AI3-38017 did not produce sensitization reactions under test conditions and are not expected to produce sensitization reactions in man. |
| Challenge dose of DNCB in positive control guinea pigs produced a marked sensitization reaction in 10 out of 10 guinea pigs. |
| DNCB produced a marked reaction, indicating the guinea pigs respond to sensitizing agents. |

* A known skin sensitizer
Study No. 75-51-0246-82, Nov 79 - Jan 82

5. CONCLUSION. Technical grade chemical produced mild injury to the cornea, and in addition some injury to the conjunctiva of rabbits. It did not cause any skin or photoirritation. It did not produce a sensitization reaction, or prove to be an acute ingestion hazard. The Analytical Quality Assurance review is located in Appendix B.

6. RECOMMENDATION. Under the provisions of the Memorandum of Understanding (paragraph 1b), it is recommended that AI3-38017 be approved for further testing as a candidate insect repellent.

APPENDIX A

TOPICAL HAZARD EVALUATION PROGRAM

DEFINITIONS OF CATEGORIES OF COMPOUNDS BEING CONSIDERED FOR ACUTE SKIN APPLICATION

CATEGORY I - Compounds producing no primary irritation of the intact skin or no greater than mild primary irritation of the skin surrounding an abrasion. (INTERPRETATION: No restriction for acute application to the human skin.)

CATEGORY II - Compounds producing mild primary irritation of the intact skin and the skin surrounding an abrasion. (INTERPRETATION: Should be used only on human skin found by examination to have no abrasions or may be used as a clothing impregnant.)

CATEGORY III - Compounds producing moderate primary irritation of the intact skin and the skin surrounding an abrasion. (INTERPRETATION: Should not be used directly on the skin without a prophetic patch test having been conducted on humans to determine irritation potential to human skin. May be used without patch testing, with extreme caution, as clothing impregnants. Compound should be resubmitted in the form and at the intended use concentration so that its irritation potential can be reexamined using other test techniques on animals.)

CATEGORY IV - Compounds producing moderate to severe primary irritation of the intact skin and of the skin surrounding an abrasion and, in addition, producing necrosis, vesiculation, and/or eschars. (INTERPRETATION: Should be resubmitted for testing in the form and at the intended use concentration. Upon resubmission, its irritation potential will be reexamined using other test techniques on animals, prior to possible prophetic patch testing in humans, at concentrations which have been shown not to produce primary irritation in animals.)

CATEGORY V - Compounds impossible to classify because of staining of the skin or other masking effects owing to physical properties of the compound. (INTERPRETATION: Not suitable for use on humans.)

EYE CATEGORIES:

A. Compounds noninjurious to the eye. INTERPRETATION: Irritation of human eyes is not expected if the compound should accidentally get into the eyes, provided it is washed out as soon as possible.

B. Compounds producing mild injury to the cornea. INTERPRETATION: Should be used with caution around the eyes.

C. Compounds producing mild injury to the cornea, and in addition some injury to the conjunctiva. INTERPRETATION: Should be used with caution around the eyes and mucosa.

D. Compounds producing moderate injury to the cornea. INTERPRETATION: Should be used with extreme caution around the eyes.

E. Compounds producing moderate injury to the cornea, and in addition producing some injury to the conjunctiva. INTERPRETATION: Should be used with extreme caution around the eyes and mucosa.

F. Compounds producing severe injury to the cornea and to the conjunctiva. INTERPRETATION: Should be used with extreme caution. It is recommended that use be restricted to areas other than the face.
APPENDIX B

ANALYTICAL QUALITY ASSURANCE

The Analytical Quality Assurance Office certifies the following with regard to this study:

a. This study was conducted in accordance with:

   (1) Standing Operating Procedures developed by the Toxicology Division, USAEHA.

b. Facilities were inspected during its operational phase to insure compliance with paragraph a above.

c. The information presented in this report accurately reflects the raw data generated during the course of conducting the study.

PAUL V. SNEERINGER, Ph.D.
Chief, Analytical Quality Assurance Office
