OFFICE OF NAVAL RESEARCH
Contract N00014-76-C-0408
Project NR 092-555

Contract Title: ROLE OF CHEMICAL BONDING IN ADHESION

FINAL REPORT

Principal Investigators: A. N. Gent and P. Dreyfuss
Institute of Polymer Science
The University of Akron
Akron, Ohio 44325

ONR Scientific Officer: Dr. R. S. Miller
Office of Naval Research (Code 432)

June, 1985

Reproduction in whole or in part is permitted for any purpose of the United States Government
### Title and Subtitle:
Role of Chemical Bonding in Adhesion

### Author(s):
A. N. Gent

### Performing Organization Name and Address:
Institute of Polymer Science
The University of Akron
Akron, Ohio 44325

### Controlling Office Name and Address:
Office of Naval Research (Code 432)
Power Program
Arlington, VA 22217

### Security Classification (of this report):
Unclassified

### Distribution Statement:
According to attached distribution list. Approved for public release; distribution unrestricted.

### Key Words:
Adhesion, Bonding, Composites, Elastomers, Inclusions, Rubber, Strength

### Abstract:
This report lists and summarizes technical activities, reports, and publications completed during the period of the contract.
1. Introduction

This project was concerned with the principal factors that govern the strength of elastomers when filled with rigid particles. The factors studied were: (i) the level of adhesion between the elastomer and the rigid surface; (ii) the size and number of the rigid inclusions; and, (iii) the strength of the elastomer itself. The main findings are outlined below and in 38 technical reports and publications, listed on pages 3-6. Additional keywords: elastomer composites, rubber.

2. Adhesion between elastomers and rigid surfaces.

The elastomers employed were polydimethylsiloxane, polybutadiene, ethylene-propylene copolymer (EPDM) and polyurethanes based on polybutadiene glycol. Substrate materials have included glass, aluminum, Mylar and various elastomers. Several specific modes of bonding have been detected in particular cases. In all cases, however, a direct correlation has been found between the mechanical strength of adhesion and the inferred degree of chemical interlinking between the two substances.

3. Effect of size, shape, and density of inclusions.

Small adhering spherical inclusions are not easily debonded. This experimental fact is supported by theoretical analysis also. However, failures were observed in the elastomeric binder near the bonded surface, and between two inclusions, when the local triaxial tension exceeded a critical level. A vacuole then appeared abruptly, and grew into a large propagating crack if the stresses were unbalanced in an appropriate way. This cavitation process is less serious with stiffer binders and with smaller inclusions, but it has not yet been thoroughly explored for highly-filled systems.

Under severe conditions, notably at high temperatures and under sustained loads, and especially in the swollen state, the strength of crosslinked elastomers reaches a minimum level. This threshold value has been successfully measured for a wide variety of materials and shown to be in good agreement with a simple molecular theory. The threshold strength of any new elastomeric material, crosslinked to any degree, can
therefore now be predicted with some confidence. Behavior under other conditions has also been studied. At high rates of strain, inertia effects become important and the maximum rate of crack growth has been shown to be of the same order as the speed of sound in the elastomer. (This is found to be extremely high for highly-stretched elastomers, which become effectively much stiffer.) At low temperatures, when the elastomer becomes glass-hard, the strength becomes comparable to that of rigid plastics. And when the elastomer is capable of crystallization the strength becomes much greater than before, probably due to the plastic work expended in disrupting crystallites. Further work is needed to put this last aspect of "reinforcement" on a sound theoretical basis.

5. Conclusions

Major advances have been made in our understanding of failure processes in elastomeric materials themselves, in elastomeric composites containing spherical or fibrous rigid inclusions, and at the interface between an elastomeric material and a rigid material. In the course of this work new test methods for measuring the strength of adhesion have also been developed.
Technical Reports and Publications

Personnel

Faculty: Alan N. Gent, Principal Investigator

Post-Doctoral Fellows and Research Associates:
- P. Dreyfuss, Co-Principal Investigator
- A.K. Bhowmick, Post-Doctoral Fellow
- R.P. Burford, Visiting Scientist from University of New South Wales, Sydney, Australia
- Y. Eckstein, Post-Doctoral Fellow
- F. Liang, Visiting Scientist from Chinese Rubber Research Institute, China
- Q.S. Lien, Post-Doctoral Fellow
- M.L. Runge, Post-Doctoral Fellow
- K.C. Sehgal, Post-Doctoral Fellow
- P. Vondracek, Visiting Scientist from Macromolecular Research Institute, Prague, Czechoslovakia
- O.H. Yeoh, Visiting Scientist from Malaysian Rubber Research Institute, Kuala Lumpur, Malaysia

Ph.D. Students (date awarded):
- K. Cho
- N.K. Eib
- M.D. Ellul(1984)
- J. Jeong(1985)
- P. Marteny(1982)
- B. Park(1983)
- C.T.R. Pulford(1978)

M.S. Students (date awarded):
- C.C. Hsu(1979)
- J. Jeong(1983)

Undergraduate Students:
- C. Slezak
- J.R. Williams
(DYN)
