xxxii
Objective(s): To test the effectiveness of treating severe hematomas with the Helium Neo Laser (HeNe Laser).

Technical Approach: The right lateral thighs of rats were gravitationally traumatized yielding full thickness hematomas. Experimental animals were treated with an HeNe laser (632.8 nm) over a 10 day period and their lesions compared to those of untreated animals. Hematomas were visualized histologically and by 67Ga gamma scans.

Progress: "Healing curves" based on 67Ga uptake ratios in the traumatized vs non-traumatized leg reveal no statistically significant enhancement of healing with HeNe laser therapy. Histological evaluations have proven extremely difficult to tabulate but subjective reviews imply no difference in the healing patterns between control and treated legs. Furthermore, objective data analysis is desired if funds are available for computerized morphometric types of analysis.
Objective(s): To determine if presence of bladder surface mucin and/or artificial reconstitution thereof prevents implantation of transitional cell carcinoma of the bladder after mucin removal with standard urologic intravesical irrigants.

Technical Approach: Animals are randomized to receive either heparin prophylaxis or saline control to attempt to prevent adherence and growth of intravesically-implanted transitional cell carcinoma.

Progress: This study was performed in duplicate. Although a previous study suggested that mucin reconstitution may prevent implantation of transitional cell carcinoma, this study was unable to prove such an association.
## Title
Radiation Therapy and Synergism with Chemotherapy for Treatment of Transitional Cell Carcinoma of the Bladder.

### Start Date
3 May 84

### Est Comp Date:

### Principal Investigator
Ian M. Thompson, M.D., CPT, MC

### Dept/Svc
Department of Surgery/Urology

### Associate Investigators:
- William Gregory, SP5
- Wendy Blomgren, SP5
- Clayton L. Hadick, D.V.M., CPT, VC
- Madahava Baikadi, M.D., MAJ, MC
- C. Ritchie Spence, M.D., COL, MC

### Objective(s):
To investigate the therapeutic effects of external beam radiotherapy and its possible synergism with chemotherapeutic agents in the therapy of murine transitional cell carcinoma.

### Technical Approach:
Two separate studies will be performed which will study the effect of radiation therapy for post-excisional treatment of transitional cell carcinoma.

The second study will investigate the effect of radio-sensitizers and cytoxan in the treatment of established murine transitional cell carcinoma.

### Progress:
This is a two-part study. The first part, employing cisplatin, radiation therapy, a combination of both, and control animals demonstrated that radiated animals had a lesser degree of mortality than did any of the other treatment arms. The second part of the study will begin shortly.

### Cost:
OMA Cost: 714.00

### Number of Subjects Enrolled During Reporting Period:

### Total Number of Subjects Enrolled to Date:

### Date of Periodic Review:

### Results:
Objective(s): To study the incidence of pelvic and intraperitoneal adhesions when using synthetic sutures on peritoneal closure.

Technical Approach: Forty rabbits were used for this study. Animals were divided into four groups. One group was reperitonealized using braided polyglycolic suture, one was reperitonealized using chromic suture, one was repaired with PDS suture, and the final group had no sutures used on the peritoneum.

Progress: There was no difference seen as far as the type of suture used and the incidence of pelvic and intraperitoneal adhesions.

Objective(s): To develop a model of induced transitional cell carcinoma in the non-human primate.

Technical Approach: Transitional cell induction will be performed via oral carcinogen feeding in non-human primates. The implications of the study are tremendous with an ability to perfect a model which would allow controlled evaluation of surgical, chemotherapeutic, and radiation therapeutic modalities for the treatment of transitional cell carcinoma.

Progress: This study will start as soon as funding is approved.

Objective(s): To determine if intra-arterial infusion of Cisplatin (CDDP) in
conjunction with direct hemoperfusion (DHP) will deliver a high concentration
of anticancer drug to the bladder while reducing systemic levels of the drug.

Technical Approach: An experimental pig model was developed to investigate the
feasibility of intra-arterial infusion of Cisplatin in combination with direct
hemoperfusion (DHP). The basic concept was to infuse high dose Cisplatin into
the plevic arterial system to achieve high tissue levels within the bladder and
at the same time remove Cisplatin from the circulation by DHP. There were four
experimental groups with all but one group employing DHP with increasing infu-
sion doses of Cisplatin. Blood, bladder tissue, urine and ultrafiltrate from
the DHP unit were assayed for platinum levels.

Progress: High dose intra-arterial infusion of Cisplatin was found to deliver
high concentration of Cisplatin to the bladder and tissue levels of platinum
were not compromised by the utilization of DHP. DHP was seen to keep serum
levels of platinum at levels equivalent to serum levels seen at lower doses not
utilizing DHP. The therapeutic efficacy and reduction in side effects awaits
evaluation through clinical studies.

Objective(s): To serve as a training protocol to teach the technique of creation of a continent ileal conduit to Urology residents at BAMC.

The development of a noncanine model for the long-term observation of anatomic results of the Koch ileal conduit.

Technical Approach: Thus far, six procine subjects have undergone a randomized trial of standard sutured versus surgically stapled Koch urinary ileal conduits. Animals have been sacrificed approximately one week postoperatively.

Progress: Thus far, a number of Yorkshire Pigs have been used for creation of a Koch ileal pouch. Six animals were analyzed postoperatively for one week for ureteroileal leaks and pouch closure. A single nipple valve was noted to fail in this period, but otherwise, pouches were noted to be successful. Several other animals have been employed in terminal experiments to improve techniques of actually creating the conduit.

Date of Periodic Review Results

Objective(s):

1) Study the effects of chronic hypertension in a primate population on arterial dynamics compared to age-sex matched controls.

2) Determine specificity and sensitivity of arterial dynamic parameters to assess the resistive and capacitive components of hypertension.

3) Assess the accuracy of in vivo catheterization techniques to predict directly measured central aortic compliance.

4) Evaluate the differences of hydrodynamic variables between in vivo and in vitro states.

Technical Approach: In vivo catheterization with 6-sensor and flow catheter simultaneous pressure/cine v-grams and aortograms at low blood pressure, control and hypertensive pressures were done. Aorta was occluded at three pressure levels at various sites. In vitro study was done in sink table mock circulatory system using aortas from necropsy. Sine/wave spike stimuli were used.

Progress: Six control baboons and five hypertensive baboons were found and in vivo and in vitro data collected. Data analysis is in progress.
Title: LASER Therapy for Coronary Atherosclerosis in the Adult Baboon

Objective(s): 1) To identify which members of a population of adult baboons have developed significant coronary artery disease as a result of exposure to a highly atherogenic diet and experimentally-induced intimal disruption.

2) To identify the appropriate techniques of angioscopy and LASER delivery and manipulation that result in selective destruction of atherosclerotic plaques without damaging the vascular intima or media.

Technical Approach: In Phase I, we hope to identify which animals of a large baboon population have developed significant atherosclerosis, having been fed a highly-atherogenic diet using standard cardiac catheterization techniques. Phase II includes LASER vaporization of the plaques developed through phase I.

Progress: This is a new study. No data are available at this time.

**Results:**

**Objective(s):** To test the effectiveness of treating full thickness burns with a Helium Neon Laser (HeNe Laser).

**Technical Approach:** Forty male rats will be utilized for this study. Full thickness burns will be administered bilaterally on the lateral thighs. The animals will then be lasered on one leg over the entire surface of the burn for four minutes. The animals will then be divided into two subgroups for evaluation by Technetium 99m-pyrophosphate imaging.

**Progress:** This is a new study. No reportable data are available at this time.

Total Number of Subjects Enrolled to Date:
Date of Periodic Review n/a  Results

Objective(s): To develop a percutaneous technique for direct intravascular visualization of the heart and vessels.

Technical Approach: In vivo examination of cardiovascular structures will be attempted with fiberoptic techniques developed in the postmortem and isolated heart-lung preparations in 20 animals. Angioscopy will be performed while simultaneously recording high-fidelity hemodynamic data and echocardiograms. Ten acute and ten chronic experiments will be performed.

Progress: This is a new study.
Objective(s): To determine the efficacy of hyperfractionated radiotherapy in comparison to standard daily radiotherapy fractions.

Technical Approach: Animals will be anesthetized and 0.1 cc of tumor suspension injected subcutaneously. Animals will be followed until 90 animals have developed tumors. Animals with equal tumor volumes will be randomly assigned to three groups. The control group will be followed until all animals have expired of their tumor burden. The radiotherapy group will receive 4000 rad directed to tumor sites via radiotherapy. The hyperfractionation radiotherapy group will receive 4000 rad directed to tumor sites in a manner identical to the radiotherapy group with the exception that doses will be halved and given twice daily, approximately 4 hours apart. During treatment of all groups, tumors will be measured three times a week in two dimensions and volumes calculated.

Progress: This is a new study. No reportable data are available.
Objective(s): To evaluate the efficacy of hydroxyurea in preventing and controlling the symptoms of thrombosis and bleeding with 1) the clinical entity primary thrombocytopenia, 2) those patients with myelofibrosis—myeloid metaplasia with elevated platelet counts, and 3) those patients with unclassified myeloproliferative disease with elevated platelet counts.

Technical Approach: In order to be eligible for entry on this study, the patient must meet the following criteria: 1) Absence of Philadelphia chromosome, 2) absence of an increased red cell mass, 3) bone marrow which shows marked megakaryocytic hyperplasia and abundant platelet clumps, 4) thrombosis not secondary to some identifiable cause, and 5) must not have had a pre-existing cancer, other than skin cancer.

Therapy will follow the schema outlined in the study protocol.

Progress: Six patients remain on the study and are doing well.
Title: Adjuvant Chemotherapy with 5-Fluorouracil, Adriamycin, and Mitomycin-C (FAM) vs Surgery Alone for Patients with Locally Advanced Gastric Adenocarcinoma.

Objective(s): To determine the efficacy of adjuvant chemotherapy with 5-FU, Adriamycin and Mitomycin-C (FAM) on the disease-free interval and survival of patients with TNM stage-groups IB, IC, II and III gastric adenocarcinoma compared to potentially curative surgery alone.

Technical Approach: Eligible patients must have localized lesions at least extending into the submucosa and involving any of the deeper layers with the maximum allowable penetration into but not through the serosa; localized lesions extending through serosa, with or without direct extension to contiguous structures; a lesion diffusely involving the wall of the stomach with or without metastases to immediately adjacent perigastric nodes or a localized lesion of any depth with metastases to perigastric nodes in the immediate vicinity; a localized or diffuse lesion with metastases to perigastric nodes distant from primary.

Therapy will follow the schema outlined in the study protocol.

Progress: One hundred thirty-four patients are registered on this study. Only 89 patients are currently evaluable for recurrence and survival.
Date: 11 Sep 85  Proj No: SWOG 7808  Status: Ongoing

Title: Combined Modality Treatment for Stages III and IV, Hodgkin's Disease - MOPP #6.

Start Date  FY 79  Est Comp Date:
Principal Investigator  Facility
Glenn M. Mills, M.D., LTC, MC  Brooke Army Medical Center
Dept/Svc  Associate Investigators:

Cost:  OMA Cost:
Number of Subjects Enrolled During Reporting Period: 0
Total Number of Subjects Enrolled to Date: 0
Date of Periodic Review  9 November 1984  Results Continue

Objective(s): 1. To attempt to increase the complete remission rate induced with MOP-BAP alone utilizing involved field radiotherapy in patients with Stages III and IV Hodgkin's disease achieving a PR at the end of 6 cycles of MOP-BAP.

2. To determine if immunotherapy maintenance with levamisole or consolidation with low dose involved field radiotherapy will produce significantly longer remission durations over a no further treatment group when CR has been induced with 6 cycles of MOP-BAP in Stages III and IV Hodgkin's disease.

Technical Approach: Eligible patients must have a histological diagnosis of Hodgkin's which must be classified by the Lukes and Butler system.

Therapy will follow the schema outlined in the study protocol.

Progress: Of 32 patients who have received radiotherapy, three have relapsed (9%) in comparison with 11 of 50 (22%) who have received no radiotherapy. There is not a significant difference (p = 0.16).
Objective(s): 1. To compare the disease-free interval and recurrence rates in estrogen receptor positive (ER+) premenopausal patients with Stage II disease, using combination chemotherapy alone versus chemotherapy and oophorectomy.

2. To compare the disease-free interval and recurrence rates in estrogen receptor positive postmenopausal patients with Stage II disease, using combination chemotherapy plus tamoxifen versus tamoxifen alone versus combination chemotherapy alone.

3. To compare the disease-free interval and recurrence rates in all estrogen receptor negative (ER-) patients with Stage II disease using one versus two years of combination chemotherapy.

4. To compare the effect of these various adjunctive therapy programs upon the survival patterns of such patients.

5. To correlate the ER status with disease-free interval and survival.

Technical Approach: All patients must have had a radical or modified radical mastectomy with histologically proven breast cancer and with one or more pathologically proven axillary nodes. Primary neoplasm and clinically apparent axillary disease must be completely removed. Pretherapy studies must reveal no evidence of metastatic disease or involvement of the other breast. Therapy will follow the schema outlined in the study protocol.

Progress: The ER negative phase of the study has been completed. However, the ER positive components to this study need to accrue more patients. It is too early to comment on results at this time.
Title: Radiation Therapy in Combination with CCNU in Patients with Incompletely Resected Gliomas of the Brain, Grade I and II.

Objective(s): 1) To compare the survival of patients with incompletely resected Grade I and II gliomas treated with radiation alone vs radiation and CCNU.

2) To compare the effectiveness of radiation therapy vs radiation therapy plus CCNU for remission induction and duration of remission.

Technical Approach: Patients with histologically confirmed primary brain tumors of the following histologic types are eligible: Astrocytoma, Grade I and II with incomplete tumor resection. Patients who have had surgery with histologic diagnosis within the previous six weeks are eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: At the present time, an analysis of survival comparing radiation alone to radiation plus CCNU has radiation therapy alone demonstrating a superior survival with a p value of .001 in a two-tailed test.

Objective(s): To determine the efficacy of standard pulse, intermittent busulfan therapy plus oral Vitamin A in prolonging the chronic phase of CML, and hence in prolonging survival.

Technical Approach: All patients with newly diagnosed chronic stage CML will be eligible for entry onto this protocol. Patients who have had prior hydroxyurea and/or leukopheresis for less than seven days after initial diagnosis are likewise eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: There is a strong possibility this protocol will close soon because it is unlikely accrual goals will be met within a reasonable time frame.

Objective(s):
1) To compare the disease-free survival and overall survival for surgery alone (with chemotherapy for relapers) vs surgery plus early adjuvant chemotherapy in patients with resectable Stage II testicular cancer.

2) To register and follow patients with non-seminoma, non-choriocarcinoma stage I testicular cancer, to define prognostic variables which may predict recurrence in this stage group.

3) To define the difference in disease-free rates and patterns of recurrence based upon histologic subtypes and extent of disease on initial presentation.

4) To evaluate the role of marker substances such as human chorionic gonadotropin, alpha-fetoprotein, and lactic dehydrogenase in the early detection and management of recurrences in patients with stage I and stage II testicular carcinoma.

5) To evaluate the accuracy of lymphangiogram, CAT scans, and ultrasound studies for staging of retroperitoneal nodal involvement.

Technical Approach: Patients with histologically confirmed carcinoma of the testis, stage I or stage II, are eligible. Patients should enter the study between two and four weeks after lymphadenectomy.

Therapy will follow the schema outlined in the study protocol.

Progress: The study continues to show prevention of relapses in Stage II patients with chemotherapy. However, the study also continues to show good recovery and curative treatment for patients who receive chemotherapy at relapse.

Number of Subjects Enrolled During Reporting Period: 0
Total Number of Subjects Enrolled to Date: 2
Date of Periodic Review 9 November 1984  Results Continue

Objective(s):
1) To evaluate the effectiveness, as determined by the complete remission rate of the L10 protocol using, Vincristine, Prednisone, and Adriamycin for induction, followed by intensive consolidation in the treatment of acute ALL.

2) To compare the effect on remission duration and survival of two maintenance regimens: the L10 "eradication" regimen vs cyclic therapy with POMP-COAP-OPAL.

3) To determine the reproducibility of the FAB histologic classification and correlation to response to therapy of ALL in adults.

Technical Approach: Patients are eligible with the diagnosis of acute lymphoblastic leukemia who satisfy the following criteria: a) Absolute infiltration of the marrow with >50% blasts (Absolute infiltration is defined as the total blast cell percentage (%) multiplied by the bone marrow cellularity percentage divided by 100); b) If the absolute infiltrate is 30-49%, evidence of progressive disease prior to entering the study will be required.

Therapy will follow the schema outlined in the study protocol.

Progress: Groupwide, this protocol has accrued 130 evaluable patients. The complete response rate is 72%. There were 24 early deaths during induction therapy. The majority of these deaths occurred in patients over the age of 50. The overall median survival on this study at the present time is 1.5 years. Patients under the age of 20 appear to have a shorter median duration of remission than the overall group.

Results Continue

Objective(s): To determine the length of remission, recurrence rates, survival rates, and pattern of recurrence for patients receiving therapy utilizing surgery and postoperative radiation vs combined therapy utilizing preoperative chemotherapy, surgery, and postoperative radiation therapy in operable Stage III or IV epidermoid carcinoma of the head and neck.

Technical Approach: Patients with operable lesions will be randomized between two therapeutic programs: Arm I - combined therapy including surgery and postoperative radiation therapy; or Arm 2 - combination chemotherapy followed by surgery and radiation therapy. Patients randomized to the chemotherapy limb will receive three courses of chemotherapy consisting of cis-platinum, methotrexate, vincristine, and bleomycin.

Therapy will follow the schema outlined in the study protocol.

Progress: Patient accrual was good. The overall response of 75% and complete response rate of 29%.
Title: Combined Modality Therapy for Disseminated Soft Tissue Sarcomas, Phase II.

Start Date: May 81

Objective(s):
1) To compare the effectiveness of bolus administration of Adriamycin and DTIC, to continuous infusion administration of Adriamycin and DTIC, in remission induction of patients with disseminated soft tissue sarcomas.
2) To compare the toxicities of these two drug schedules.
3) To determine the feasibility on a group-wide basis of surgical excision of accessible lesions in partially responding patients.
4) To compare the histology of the diagnostic lesion with the histology of tumor removed from the partial responder.

Technical Approach: Patients with a biopsy confirmed diagnosis of a soft tissue sarcoma with convincing clinical or biopsy-documented evidence of metastatic disease are eligible for this study. Patients must not have received prior chemotherapy with the agents used in this study. Patients must have a life expectancy of 10 weeks, and all patients must have lesion(s) which is measurable and can be followed for tumor response.

Progress: Response rates are improving as the study progresses with the continuous infusion arm showing a lower response rate to date. Life-threatening toxicity is similar in both arms since the DTIC dose was decreased in the continuous infusion arm.

Objective(s): 1) To determine the response rate and survival in patients with advanced pancreatic adenocarcinoma treated with 5-FU, Adriamycin, Mitomycin-C, and Streptozotocin (FAM-S).

2) To determine further the toxicity of the FAM-S regimen.

3) To determine the activity of a Phase II drug in previously untreated patients with advanced adenocarcinoma of the pancreas by determination of response rate and duration of response and survival.

4) To determine further the toxicity of each Phase II agent.

Technical Approach: Patients with histologic confirmation of adenocarcinoma of the exocrine pancreas with distant metastases and/or those with localized disease not amenable to curative surgery or radiotherapy are eligible. All patients must have objectively measurable disease and a life expectancy of at least 10 weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: Sixteen good risk patients were randomized to AZQ. No responses in these 16 patients were observed. It was concluded that AZQ has no value in the treatment of pancreatic carcinoma.

Objective(s): 1) To determine the antitumor activity of AZQ in pancreatic carcinoma.

2) To further determine the nature and extent of AZQ in a Phase II study.

Technical Approach: Patients with histologic confirmation of adenocarcinoma of the exocrine pancreas with distant metastases and/or those with localized disease not amenable to curative surgery or radiotherapy are eligible. All patients must have objectively measurable disease and a life expectancy of at least 10 weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: Groupwide, eighteen patients fully evaluable for response have been entered on this protocol with no complete or partial remissions identified. This study indicated no significant antitumor activity for AZQ in pancreatic cancer.

Objective(s): 1) To determine the efficacy of surgical excision or surgical excision plus vitamin A in preventing the recurrence of high-risk, Stage I malignant melanoma by determination of remission or disease-free interval.

2) To determine the immunocompetence of patients with malignant melanoma and to determine the influence of vitamin A upon that immunocompetence.

Technical Approach: All patients with a histologically-confirmed diagnosis of high-risk Stage I malignant melanoma who have not been previously treated with chemotherapy, radiation therapy or immunotherapy are eligible. All patients must have had a wide local excision of the primary lesion.

Therapy will follow the schema outlined in the study protocol.

Progress: Ninety-seven percent of the patients receiving Vitamin A had none to moderate toxicity with only 3% having severe. Stage II melanoma patients will now be placed on this study.
Objective(s): 1) To utilize the human tumor cloning assay to select single agent chemotherapy for patients with epithelial-type ovarian cancer, refractory to standard therapy.

2) To determine if the human tumor cloning system can be utilized to select individual patient's therapy in a cooperative group setting.

Technical Approach: Eligible patients must have a pathological diagnosis of epithelial-type ovarian cancer in pleural or peritoneal fluid. Patients should have measurable disease and a life expectancy of at least three months.

Progress: Fifty-nine percent of the submitted specimens formed greater than 30 colonies per plate with a median number of colonies for a control plate of 52. The percent true positive rate for the assay with respect to the single agent correlations was 38% and for combination therapy was 60% with an overall predictive accuracy for response of 47%. The overall percent true negative for both single agent and combination agent therapy was 86%.

Objective(s): 1) To evaluate in a randomized prospective manner, the efficacy of Adriamycin in improving the disease-free interval in patients who will receive hemithoracic radiotherapy for Stage I pleural mesothelioma.

2) To further define prospectively the efficacy of radiotherapy to the involved hemithorax in patients with pleural mesothelioma.

Technical Approach: Eligible patients will have histologically confirmed malignant mesothelioma of the pleural cavity. Patients with measurable disease or evaluable disease as well as those in whom all gross disease has been resected will be eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: Groupwide, no significant new toxicity has been noted.

Objective(s): To determine the response rate (CR + PR) of intrathecal methotrexate and whole brain irradiation in the control of solid tumor leptomeningeal metastases.

Technical Approach: All patients must have cerebrospinal fluid which is cytologically positive for malignant cells.

Therapy will follow the schema outlined in the study protocol.

Progress: Groupwide, 25 patients have been entered into this study. Of the 21 evaluable for response, 15 have had breast cancer with six showing a complete or partial response with a median duration of 3+ months and a median survival of 6+ months. The median survival of the nine non-responding breast cancer patients was 1.6 months. Three patients with melanoma, two with lung, and one with ovarian cancer failed to respond with a median survival of approximately two months.

**Objective(s):** To determine the effectiveness of cranial irradiation given electively in disseminated melanoma patients with lung and/or liver metastases to prevent or delay the clinical appearance of brain metastases.

**Technical Approach:** Patients should have histologic proof of melanoma and a negative radiographic study of the brain. Patients must have established disseminated melanoma with lung and/or liver metastases. Patients will be randomized to Arm I (DTIC plus Actinomycin) vs. Arm II (Cisplatinum, Velban, and Bleomycin). Therapy will follow the schema outlined in the study protocol.

**Progress:** The study will remain open until sufficient patient accrual has been obtained. At the first indication that the Cis-platinum combination limb is equal to or inferior to the control limb, the study will be closed. New combination chemotherapies will be piloted. If these combinations or reported combinations in the literature yield response rates of 35% or greater, they will then be used as a single limb in patients with disseminated melanoma.

**Date of Periodic Review:** 9 November 1984  
**Results Continue**

**Objective(s):**

1) To compare in a randomized fashion the effectiveness of the drug combination Vinblastine, Cis-Platinum, and VP-16 vs Vinblastine, Bleomycin and Cis-Platinum in the remission induction of patients with disseminated germ cell neoplasms of testicular origin.

2) To determine the role of six months maintenance chemotherapy vs observation for those patients who achieve a complete response during induction, or have a totally resected mature teratoma, in terms of relapse-free survival and overall survival.

3) To determine the role of six months maintenance chemotherapy vs observation for those patients with residual carcinoma having no evidence of disease following surgery, in terms of relapse-free survival and overall survival.

4) To document the nature and extent of the hematologic and non-hematologic side effects of the treatment modalities.

**Technical Approach:** Patients should have a histologically confirmed diagnosis of disseminated germ cell neoplasms of testicular origin. All patients with bulky abdominal disease (Stage cII(N4) or Stage cIII) will be eligible for the study. Patients should have an expected survival of at least eight weeks.

**Progress:** Groupwide, there have been near equal remission rates for both arms. The maintenance chemotherapy arm has been closed because so few patients were being entered.

**Objective(s):** To determine the efficacy of surgical excision plus vitamin A, and surgical excision plus combination chemotherapy (Actinomycin-D and DTIC) in preventing the recurrence of Stage II malignant melanoma by the determination of remission duration or disease-free interval.

Technical Approach: All patients must have a histologically confirmed diagnosis of lymph node melanoma and complete and adequate surgical excision of all residual disease. Patients with completely resected mucosal melanoma or first recurrence will be eligible, but will be stratified separately at the time of registration. All patients must be randomized and treatment begun within six weeks of the lymph node resection.

Therapy will follow the schema outlined in the study protocol.

Progress: This study was closed due to poor patient accrual.

Objective(s):  
1) To determine the response rate and response duration of malignant melanoma treated with bisantrene hydrochloride used in a single dose, every three-week schedule.

2) To define the qualitative and quantitative toxicities of bisantrene administered in a Phase II study.

Technical Approach: All patients must have a pathologically verified histologic diagnosis of melanoma. Bisantrene is intended for therapy of patients who have had prior exposure to, and progression of disease on, protocols of higher priority. Patients must have measurable disease.

Therapy will follow the schema outlined in the study protocol.

Progress: The study was closed due to lack of response.

Date of Periodic Review 9 November 1984  Results Continue

Objective(s): 1) To compare the response rate and duration of a new induction program (multiple alkylating agents plus Vincristine), with emphasis on complete response, to the combination of Vincristine, Adriamycin, and Cyclophosphamide in the treatment of extensive small cell lung cancer.

2) To examine the effect of radiation consolidation on relapse in the chest and liver in patients without widespread skeletal disease.

3) To assess qualitative and quantitative toxicity of this combined modality approach.

4) To perform a prospective analysis, by electron microscopy, of the available material for clinicopathologic correlation.

5) To evaluate the effectiveness of a more aggressive radiation therapy approach to clinically evident brain metastases.

6) To evaluate the impact of chest radiation therapy following relapse as to the duration of response and survival.

7) To improve survival and the quality of life in patients with extensive small cell lung cancer.

Technical Approach: All patients with extensive small cell carcinoma of the lung are eligible for entry onto this study. Patients must not have had prior treatment with chemotherapy or radiation therapy.

Therapy will follow the schema outlined in the study protocol.

Progress: The study has been closed to entry of new patients. The value of multiple local-field "consolidation" x-ray therapy after chemotherapy was essentially negative.

Accumulative MEDCASE Cost: 
Est Accumulative OMA Cost:
Number of Subjects Enrolled During Reporting Period: 6
Total Number of Subjects Enrolled to Date: 6
Date of Periodic Review Results: __ __

Objective(s): 1) To determine the complete remission-rate with intensive induction chemotherapy in patients with acute non-lymphocytic leukemia, focusing attention on those patients over 50 years of age.

2) To compare duration of remission and survival of patients receiving maintenance with or without intensification chemotherapy versus those patients receiving an HLA identical sibling bone marrow transplant while in first remission.

3) To determine the comparative toxicity of these regimens.

4) To compare the continuous maintenance therapy and late intensification with late intensification alone.

Technical Approach: All patients with a diagnosis of acute non-lymphocytic leukemia who have not received prior therapy and who do not have initial CNS leukemia will be eligible for this study. There are no age restrictions; however, patients over the age of 50 will not be considered for bone marrow transplantation.

Progress: On the bone marrow transplant arm, 30 patients have been transplanted. Seventeen are alive and free of disease. There has been no major impact of age on the success of those patients transplanted.
Title: Evaluation of Vinblastine by Continuous Infusion for Advanced, Recurrent Endometrial Carcinoma, Phase II.

Objective(s): To evaluate the efficacy of a five day vinblastine infusion with respect to remission induction, remission duration, and survival duration in patients with advanced, recurrent, or Stages III and IV endometrial carcinoma refractory to prior chemotherapy.

Technical Approach: Patients with pathologically proven adenocarcinoma of adenosquamous carcinoma of the endometrium who have recurrent disease, or Stage III or IV disease no longer treatable with radiation therapy or surgery, are eligible. Patients must not have received prior chemotherapy with vinca alkaloids. Patients may have had previous chemotherapy of other types. Patients must have clinically measurable disease either by radiologic techniques or physical examination.

Therapy will follow the schema outlined in the study protocol.

Progress: Of the 29 registered patients, 16 are presently evaluable. There have been two responders, but both may have ovarian rather than endometrial primaries. Histologic tumor sections will be reviewed to determine the origin of the primary lesions.

Metastatic Breast Cancer
Intercalating Chemotherapy

Accumulative MEDCASE Cost:
Est Accumulative Cost:
Number of Subjects Enrolled During Reporting Period: 16
Total Number of Subjects Enrolled to Date: 24
Date of Periodic Review

Objective(s):
1) To determine the comparative response rate, duration of response, and survival of equimyelosuppressive doses of Adriamycin, Mitoxantrone, and Bisantrene as single agents in breast cancer patients, not previously exposed to an intercalating agent, using a single dose, every-three-week regimen.

2) To determine the salvage response rate of Adriamycin, Mitoxantrone, or Bisantrene in breast cancer patients failing one of these three agents.

3) To assess the cardiotoxicity of Adriamycin, Mitoxantrone, and Bisantrene as determined by history, physical examination, and measurement of the left ventricular ejection fraction.

4) To compare the relative noncardiac toxicities of the three agents.

Technical Approach: Patients must have a pathologically verified diagnosis of breast cancer in order to be eligible for this study. Patients must have objectively measurable or evaluable lesion(s) excluding CNS metastases. Patients must not have been previously treated with Adriamycin, Mitoxantrone, or Bisantrene, but must have had only one prior chemotherapy regimen as adjuvant therapy.

Therapy will follow the schema outlined in the study protocol.

Progress: Preliminary analyses continue to show that adriamycin has a slightly higher response rate than either mitoxantrone or bisantrine, but mitoxantrone and bisantrine have less toxicity. None of the differences in response is as yet statistically significant.

**Objective(s):**

1) To study the response of functioning and non-functioning islet cell carcinoma to chlorozotocin (CTZ) and 5-fluorouracil (5-FU).

2) To determine the toxicity of 5-FU and CTZ when given in combination.

**Technical Approach:** To be eligible for this study, all patients must have biopsy-proven islet cell carcinoma not amenable to further surgical therapy; and a minimum life expectancy of greater than six weeks. All patients must have objectively measurable disease, or a significant biochemical abnormality secondary to endocrine hyperfunction specific for their islet cell tumors.

Therapy will follow the schema outlined in the study protocol.

**Progress:** Groupwide, 20 patients have been entered on this study. At the time of the last analysis, eight patients were evaluable for response, two having achieved partial response. These data indicated some level of activity for this combination.
**Objective(s):**

1. To test the response-rate of cis-diamminedichloroplatinum (DDP) in patients with disseminated and measurable adenocarcinoma of the stomach who are previously untreated.

2. To test the response-rate of cis-diamminedichloroplatinum in patients with disseminated adenocarcinoma of the stomach who are previously treated with 5-fluorouracil, Adriamycin, and Mitomycin-C (5-FAM) chemotherapy.

**Technical Approach:** Eligible patients must have a histologically proven gastric adenocarcinoma and be considered inoperable for cure at the time of entry on the study. Patients must have a life expectancy of six weeks or longer.

Therapy will follow the schema outlined in the study protocol.

**Progress:** This study was closed due to lack of patient response.
Detail Summary Sheet

Date: 18 Sep 85    Proj No: SWOG 8215    Status: Closed

Title: Comparison of Combination Chemotherapy with VP-16 and Cis-Platinum vs BCNU, Thiotepa, Vincristine and Cyclophosphamide in Patients with Small Cell Carcinoma of the Lung Who Have Failed or Relapsed Primary Chemotherapy, Phase 3

Start Date: 8 Jul 83    Est Comp Date:

Principal Investigator: Glenn M. Mills, M.D., MAJ, MC
Dept/Svc: Department of Medicine/Oncology

Key Words:
- Small cell lung carcinoma

Accumulative MEDCASE Cost: Est Accumulative OMA Cost: 0

Number of Subjects Enrolled During Reporting Period: 0
Total Number of Subjects Enrolled to Date: 0

Objective(s):
1) To confirm the efficacy of combination VP-16-213 (VP-16) and Cis-diamminedichloroplatinum (Cis-Platinum) in the treatment of patients with small cell carcinoma of the lung who have failed or relapsed on first-line treatment protocols.

2) Through a randomized trial, to compare the remission rate, duration of remission, and toxicity between the combination of VP-16 plus Cis-Platinum and the combination of bis-chloroethylnitrosourea (BCNU), triethylenethiophosphoramide (Thiotepa), Vincristine (Oncovin) and Cyclophosphamide (Cytoxan) in the same group of patients.

Technical Approach: For inclusion in the study, patients must have a histologically proven diagnosis of small cell carcinoma of the lung and documented relapse or progression following prior therapy. Patients must have had prior chemotherapy. All patients who have relapsed on first-line Southwest Oncology Group protocols for either extensive disease or limited disease, or who have had prior chemotherapy with other induction studies are eligible. Patients may have had prior treatment with any of the agents used in this study, but not with either of the two combinations to be employed. All patients must have a life expectancy of at least six weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: Groupwide, there are 55 patients evaluable for response to cis-platinum + VP-16, of whom 49 had no prior exposure to these agents. Only five of forty-nine (10%) had an objective response and five of thirty-nine responses to BTOC.
Objective(s): 1) To compare the effectiveness of intravesical BCG immunotherapy with intravesical Adriamycin chemotherapy with respect to disease-free interval and two-year recurrence rate.

2) To compare the toxicity of topical immunotherapy and chemotherapy.

3) To obtain experience regarding disease-free interval and the recurrence rate in patients who develop tumor recurrence and are then crossed over to the alternative treatment arm.

Technical Approach: Patients with a histologically confirmed diagnosis of transitional cell carcinoma of the bladder, Stage O(Pa) and A(P1)m with two recurrences within the last twelve months will be eligible as well as all patients with documented carcinoma in situ (PIS) on random biopsy.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study.
Objective(s): 1) To determine the response rate and remission duration of adenocarcinoma of the prostate when treated with Spirogermanium, used as a 60 minute infusion in a three times weekly schedule.

2) To define the qualitative and quantitative toxicities of Spirogermanium administered in a Phase II study.

Technical Approach: All patients must have a histologically proven diagnosis of adenocarcinoma of the prostate. They must have evaluable or measurable disease and a life expectancy of at least six weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: Twenty-three patients are evaluable. There was one partial response and no complete responses.
Title: Evaluation of Combined or Sequential Chemo-Endocrine Therapy in Treatment of Advanced Adenocarcinoma of the Prostate, Phase III

Start Date: 12 Nov 82
Est Comp Date:

Principal Investigator: Glenn M. Mills, M.D., MAJ, MC
Facility: Brooke Army Medical Center

Dept/Svc: Department of Medicine/Oncology
Associate Investigators: Walter H. Harvey, D.O., MAJ, MC

Key Words:
Adenocarcinoma of prostate

Accumulative MEDCASE Cost: Est Accumulative OMA Cost:

Number of Subjects Enrolled During Reporting Period: 1
Total Number of Subjects Enrolled to Date: 6
Date of Periodic Review Results:

Objective(s):
To compare the efficacy of the sequential use of endocrine therapy followed at the time of progression by cytotoxic chemotherapy (Adriamycin and cyclophosphamide) versus the combination of endocrine therapy and chemotherapy together in the treatment of advanced adenocarcinoma of the prostate by determination of the response rate, response duration, and duration of survival.

Technical Approach:
All patients with histologically proven, asymptomatic or symptomatic Stage D adenocarcinoma of the prostate are eligible. Patients may not have had previous hormonal therapy or chemotherapy. They should have a life expectancy of 6 weeks or greater.

Therapy will follow the schema outlined in the study protocol.

Progress:
Groupwide, 86 patients have been entered on this study of which 57 are currently evaluable. In arm I there are 28 patients and a partial response rate of 50%, complete response rate of 3%. In arm II there are 29 patients and a partial response of 59% and complete response of 7%.

**Objective(s):** To define the prognostic role of progesterone receptor in patients with newly diagnosed metastatic breast disease by correlating progesterone receptor levels with objective response rates in women treated with Tamoxifen.

**Technical Approach:** Female patients who have new, metastatic breast carcinoma are eligible for this study. Patients who have received prior hormonal adjuvant therapy are eligible, provided that they have not failed during therapy and the therapy has been stopped for at least three months. Patients must be ER+ in order to be eligible.

Therapy will follow the schema outlined in the study protocol.

**Progress:** Groupwide, one hundred and seventy-two patients have been registered on this study. Toxicity is mild and is what would be expected with patients being treated with tamoxifen.

**Accumulative MEDCASE Cost:**  
**Estimated Accumulative OMA Cost:**

**Number of Subjects Enrolled During Reporting Period:** 3  
**Total Number of Subjects Enrolled to Date:** 8

**Date of Periodic Review Results:**

**Objective(s):**
1. To compare the effectiveness of two intermittent pulse schedules of the chemotherapy combination of Vincristine, Melphalan, Cyclophosphamide and Prednisone (VMCP) plus Vincristine, BCNU, Adriamycin and Prednisone (VBAP) (alternating versus syncopated) for the induction of remissions in previously untreated patients with multiple myeloma.

2. For patients proven to achieve remission (at least 75% tumor regression after induction), to compare the value of 12 months of chemoimmunotherapy maintenance, VMCP + Levamisole, versus a consolidation program consisting of sequential half-body radiotherapy along with Vincristine and Prednisone followed by unmaintained remission.

3. For patients who only achieve improvement (50%-74% tumor regression) on chemotherapy induction, to determine whether sequential half-body radiotherapy along with Vincristine and Prednisone will increase the remission rate (at least 75% tumor regression).

4. To determine whether sequential half-body radiotherapy along with Vincristine and Prednisone can serve as an effective form of induction therapy for patients who fail to respond to chemotherapy or suffer early relapse.

**Technical Approach:** Only previously untreated patients with the diagnosis of multiple myeloma are eligible. This is a first-line study and only patients without prior cytotoxic chemotherapy are eligible.

**Progress:** Groupwide, patient accrual has been excellent. Evaluation of response to treatment and survival on this study is extremely encouraging. In as much as all patients receive VMCP-VBAP for induction, the overall response rate and early survival are extremely encouraging.

Title: Chemotherapy of Extragonadal Germinal Cell Neoplasms, Phase II

Start Date 8 Jul 83  Est Comp Date: Unknown
Principal Investigator
Glenn M. Mills, M.D., MAJ, MC
Facility
Brooke Army Medical Center

Dept/Svc
Department of Medicine/Oncology

Associate Investigators:
Walter H. Harvey, M.D., MAJ, MC

Key Words:
Germinal cell neoplasm

Objective(s):

1) To determine the effectiveness of alternating combination chemotherapy consisting of VBP (Vinblastine, Bleomycin and Cis-platinum) and EBAP (Bleomycin, Adriamycin, Cis-platinum and VP-16) in patients with metastatic germinal cell neoplasms arising in extragonadal sites.

2) To determine the overall toxicity of the alternating combination of VBP and EBAP.

3) To determine the role of surgical removal of residual disease following this drug combination in partially responding patients.

4) To compare the response rates observed in this study with those reported by other investigators.

Technical Approach: Patients presenting with a histologically confirmed diagnosis of non-resectable extragonadal germ cell tumors are eligible for this study. All patients should have clearly measurable disease, or an abnormally elevated beta HCG and/or alpha fetoprotein. Patients with extragonadal seminomatous and non-seminomatous neoplasms will be eligible for treatment on this study, but will be analyzed separately.

Therapy will follow the schema outlined in the study protocol.

Progress: Twenty-four patients have been entered on this study, and 16 are evaluable. There are 13 complete responses and two partial responses.
Title: Treatment of Limited Small Cell Lung Cancer with VP-16/Cis-Platinum, Alternating with Vincristine/Adriamycin/Cyclophosphamide and Radiation Therapy vs Concurrent VP-16/Vincristine/Adriamycin...Radiation Therapy, Phase III

Objective(s): 1) To compare the efficacy of alternating non-cross-resistant, multidrug regimens with concurrent combination chemotherapy as remission induction in patients with limited small cell lung carcinoma.

2) To determine the toxicity of these treatment programs.

Technical Approach: All patients must have histologically proven small cell carcinoma of the lung. Prior to treatment, patients should be staged as to the extent of disease. Only patients with limited disease are eligible for this study. They must have evaluable or measurable disease. Patients having a prior surgical procedure are eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: Groupwide, there was no evidence of an advantage for the alternating combined arm over repetitive administrations of the same program.

Date of Periodic Review 9 November 1984 Results Continue

Objective(s): 1) To determine the response rate, response duration, and duration of survival of gastric carcinoma treated with continuous infusion vinblastine.

2) To define the qualitative and quantitative toxicities of continuous infusion vinblastine administered in a Phase II study:

Technical Approach: Eligible patients must have a pathologically verified histologic diagnosis of adenocarcinoma of the stomach with gross unresectable residual disease. Both previously treated and untreated patients will be eligible for this study. Patients must have measurable disease and must not be receiving concomitant radiation therapy, hormonal therapy, or other chemotherapy.

Therapy will follow the schema outlined in the study protocol.

Progress: At this time, only ten patients are response evaluable without responses having been noted.
Detail Summary Sheet

Number of Subjects Enrolled During Reporting Period: 3
Total Number of Subjects Enrolled to Date: 7
Date of Periodic Review Results

Objective(s): To determine the clinical response rate of a five-day continuous infusion of vinblastine sulfate in pancreatic adenocarcinoma.

Technical Approach: To be eligible, patients must have a pathologically verified diagnosis of pancreatic adenocarcinoma. They must have objectively measurable or evaluable lesion(s) excluding CNS metastases and a life expectancy of at least eight weeks. Patients must have recovered from the toxicities of previous chemotherapy and/or radiotherapy and have demonstrated progressive disease.

Therapy will follow the schema outlined in the study protocol.

Progress: Twenty-nine patients have been registered on this study. Of 18 response evaluable patients, there are two objective partial remissions suggesting some level of anti-tumor activity for vinblastine in this setting.

Dept/Svc  Associate Investigators:
Department of Medicine/Oncology
Key Words:
CNS tumors

Accumulative MEDCASE  Est Accumulative Cost:
Cost:
Number of Subjects Enrolled During Reporting Period: 0
Total Number of Subjects Enrolled to Date: 2
Date of Periodic Review Results

Objective(s): 1) To determine the antitumor activity of Spirogermanium in malignant gliomas by evaluation of response-rate.

2) To determine the qualitative and quantitative toxicities of Spirogermanium given in a Phase II setting.

3) To estimate the duration of survival experienced by these patients.

Technical Approach: Patients must have a histologically-confirmed diagnosis of astrocytomas, Grades III and IV; ependymoblastoma; medulloblastoma; or anaplastic oligodendroglioma. They must have failed primary surgical and/or radiation therapies and not be eligible for higher priority protocols. All should have received adequate prior radiotherapy. All patients must have a measurable lesion by scan and a life expectancy of six weeks or more.

Therapy will follow the schema outlined in the study protocol.

Progress: Twenty-eight patients have been entered with 21 evaluable. Four of the 21 evaluable patients have had measurable shrinkage of tumor with stable or improved neurologic examination for a median duration of 28+ weeks. An additional four patients have had neurologic improvement lasting 5.5 weeks median duration.
Title: Evaluation of Spirogermanium in the Treatment of Metastatic Malignant Melanoma, Phase II.

Objective(s):
1) To determine the response rate and survival of malignant melanoma treated with spirogermanium.
2) To define the qualitative and quantitative toxicities of spirogermanium administered in a Phase II study.

Technical Approach: All patients must have a pathologically verified histologic diagnosis of advanced malignant melanoma. Spirogermanium is intended as therapy of patients with advanced malignant melanoma with or without prior exposure to, and progression of disease on, protocols of high priority.

Therapy will follow the schema outlined in the study protocol.

Progress: Patient accrual has been very slow.
Objectives:

1) To directly compare the efficacy and toxicity of Cis-platinum plus VP-16 (PVP) versus Cis-platinum plus Vinblastine (PVE) in patients with advanced (TNM Stage III M1) non-small cell lung cancer (NSCLC).

2) To compare the response rate, response duration, survival and toxicity of Cis-platinum plus VP-16 (PVP) to Cis-platinum plus VP16 plus MGBG (PVPM).

3) To compare the response rate, response duration, survival and toxicity of Cis-platinum plus Vinblastine (PVE) to Cis-platinum plus Vinblastine plus Mitomycin-C (PVMi).

4) To re-evaluate and compare the activity of FOMi/CAP to PVP, PVPM, PVE and PVMi using a five-arm, randomized study design.

5) To evaluate differences in response rates among patients with squamous cell carcinoma, adenocarcinoma or large cell undifferentiated carcinoma of the lung.

Technical Approach: All patients with a histologically or cytologically confirmed diagnosis of squamous cell carcinoma, adenocarcinoma or large cell carcinoma of the lung are eligible for this study. The patient's clinical presentation should be compatible with a neoplasm of bronchogenic origin.

Therapy will follow the schema outlined in the study protocol.

Progress: There is no evidence of a difference among the five randomized treatment arms. The response rate is quite low (10-20%) for all treatment arms.
Objective(s): To determine the clinical response rate of five-day continuous infusion vinblastine sulfate in diffuse malignant mesothelioma.

Technical Approach: To be eligible, patients must have a pathologically verified diagnosis of mesothelioma. The mesothelioma may arise either in the thorax or abdomen, but must be of the diffuse malignant type (i.e., not locally resectable by surgery). Patients must have objectively measurable or evaluable lesion(s) excluding CNS metastases and a life expectancy of at least eight weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: Seven patients have been entered on this study. There has been one response which occurred in an intra-abdominal mesothelioma and was coded as a partial remission, and lasted 8 weeks by abdominal CT scan.
Title: Combined Radiation Therapy and Chemotherapy as Adjuvant Treatment for Duke's B2-C Colon Cancer, Phase I-II, Pilot

Start Date: 8 Jul 83

Est Comp Date: Unknown

Objective(s): To determine the immediate and delayed toxicity of two adjuvant therapy programs for patients with Dukes B2-C colon cancer: intravenous bolus 5-fluorouracil and whole abdominal radiation therapy begun simultaneously four to six weeks postoperatively.

Technical Approach: Patients must have a histologically confirmed diagnosis of Duke's C1 (limited to the serosa with positive nodes) or C2 (extension through the serosa with positive nodes). Patients entering the study postoperatively must have an adequate surgical procedure of the tumors of the cecum and ascending colon, proximal transverse colon, splenic flexure or descending colon, or sigmoid. They must not have had any prior malignancies, inflammatory bowel disease or liver disease. Patients may not have received prior radiation therapy or chemotherapy.

Therapy will follow the schema outlined in the study protocol.

Progress: Twenty-eight patients have been registered on this study. Initial dose of 5-FU was 300 mg/M² days 1-5 and days 29-33. Significant leukopenia and thrombocytopenia was seen with this dose plus total abdominal iradiation requiring interruption of radiotherapy in 13 patients. The 5-FU dose was reduced, and hematologic toxicity has been more tolerable since.

Number of Subjects Enrolled During Reporting Period: 2 Total Number of Subjects Enrolled to Date: 12
Date of Periodic Review Results

Objective(s): 1) To explore the response rate with the concurrent use of radiation therapy plus chemotherapy utilizing Cis-platinum VP-16 and Vincristine in limited small cell carcinoma of the lung.

2) To observe the toxicities of this combined modality program.

Technical Approach: Patients with a histologically or cytologically proven diagnosis of small cell carcinoma of the lung will be eligible for this study. All patients must have so-called "limited disease". This is defined as disease confined to one hemithorax, mediastinum, hilar and supraclavicular areas, which could be encompassed within a single radiation therapy port. Patients having had surgical diagnostic or therapeutic techniques are eligible, except if all gross evidence of disease has been removed after surgical resection.

Therapy will follow the schema outlined in the study protocol.

Progress: With 27 patients registered and 16 fully or partially evaluable, 11 have had complete responses and four partial responses. Five patients are now in complete remission beyond a year.

Objective(s): This prospective randomized study is designed to evaluate the efficacy of adjuvant Adriamycin compared to standard treatment (a delay of chemotherapy until the time of demonstrated relapse) in the management of patients with Stages IIB, IIIA-C and tissue sarcoma in terms of local recurrence rate, disease-free interval, and survival.

Technical Approach: For inclusion in this study, patients must have a histopathologically proven diagnosis of soft tissue sarcoma Stages IIB, IIIA-C, and IVA. The tumor may be either previously untreated or a local recurrence.

Therapy will follow the schema outlined in the study protocol.

Progress: Fifty-five patients have been entered on this study. Thus far, one case of severe leukopenia and one case of severe nausea and vomiting have been reported. No additional reportable data are available.

Key Words: Brain metastases

Accumulative MEDCASE Cost:  Est Accumulative OMA Cost:
Number of Subjects Enrolled During Reporting Period: 4
Total Number of Subjects Enrolled to Date: 5
Date of Periodic Review Results

Objective(s): 1) To test whether the addition of surgery before radiation therapy is a significant improvement over radiation therapy alone in the treatment of patients with apparent single brain metastases. Endpoints studied will be:

- One year survival rates and median survival times.
- Local control rates of brain metastases one month and six months after treatment.
- Improvement of neurological deficit as measured by the percentage of patients with improved neurological function.

2) To evaluate patient refusal with respect to the surgical component.

Technical Approach: All patients having histologically confirmed cancer with evidence of a potentially resectable single intracranial mass lesion as documented by a contrast-enhanced CAT scan are eligible. Only patients with apparently resectable cerebellar or cerebral cortex lesions will be eligible. Patients with bronchogenic carcinoma should have control of the primary tumor and no other metastases prior to admission on this study.

Progress: Patient accrual has improved significantly. No reportable data are available.

Date of Periodic Review 9 November 1984 Results Continue

Objective(s): 1) To better define the relative roles of systemic and local treatments in the care of resectable locally or regionally recurrent cancer of the breast in patients who have no evidence of disease after resection.

2) To assess the effects of chemotherapy, radiation therapy, singly or in combination, administered immediately after surgical resection on control, disease-free interval and pattern of re-recurrence.

3) To determine the effects of the administration of systemic chemotherapy or radiation therapy which has been delayed until local, regional, re-recurrence upon local and regional control, disease-free survival, patterns of relapse, and survival.

Technical Approach: To be eligible, patients must have undergone a surgical resection with tumor-free margins leaving the patient clinically free of disease less than 6 weeks prior to entry into the study. Patients must have histologically proven technically resectable locally or regionally recurrent breast cancer, the primary of which was initially treated by surgery without postoperative irradiation.

Therapy will follow the schema outlined in the study protocol.

Progress: No reportable data are available at this time.

**Objective(s):**  
1) To assess the impact of short-term intensive chemotherapy with CMFP to prevent disease recurrence and prolong survival in N- patients with any size ER- tumor and N- patients with ER+ tumors whose pathological size is greater than or equal to 3 cm.

2) To assess the impact of surgical procedures, ER status, menopausal status and tumor size.

3) To develop guidelines referable to histopathological features of N- tumors which are reproducible and assess their prognostic impact for disease-free survival and survival.

4) To assess the value to CEA in predicting recurrence and survival rates.

5) To assess the natural history of a subgroup with N-, ER+ small tumors.

**Technical Approach:** All female patients having had at least a total mastectomy with an axillary dissection or total mastectomy with low axillary dissection for potentially curable breast carcinoma as defined in this protocol and having no histopathological evidence of axillary node involvement will be considered for inclusion in this study.

Therapy will follow the schema outlined in the study protocol.

**Progress:** No reportable data are available at this time.
Title: Treatment of Limited Non-Small Cell Lung Cancer: Radiation vs Radiation plus Chemotherapy (FOMi/CAP), Phase III.

Start Date: 26 Oct 84
End Comp Date: n/a

Objective(s): 1) To compare combination chemotherapy plus radiotherapy to radiotherapy alone for patients with limited, non-small cell lung cancer (NSCLC) in a randomized study with stratification for known important prognostic factors with regard to response rate, response duration and survival duration.

2) To determine the toxicity of radiotherapy plus FOMi/CAP relative to radiotherapy alone for patients with limited NSCLC.

3) To evaluate the responsiveness of small tumor burdens to FOMi/CAP (i.e., less than metastatic disease).

4) To determine the pattern of relapsing disease in each treatment arm and in subgroups of patients determined by histology and response to FOMi/CAP.

5) To determine if prophylactic brain irradiation will decrease the chances for brain metastases and influence toxicity or survival.

Technical Approach: All patients must have a histologic or cytologic diagnosis of non-small cell carcinoma of the lung. Patients must have limited disease. Disease must be confined to a single hemithorax, and/or ipsilateral hilar lymph nodes, and/or the mediastinum, and/or the ipsilateral supraclavicular lymph nodes. In addition, the patient's disease must be encompassable in a single radiation port.

Therapy will follow the schema outlined in the study protocol.

Progress: No reportable data are available.

Date of Periodic Review Results

Objective(s): To test the effectiveness and toxicity of DMF (Doxorubicin, Mitomycin-C, and 5-Fluorouracil) in the treatment of Stage D2 adenocarcinoma of the prostate.

Technical Approach: Patients with histologically proven, metastatic adenocarcinoma of the prostate with measurable disease are eligible. Patients with blastic bone lesions on x-ray as a sole manifestation of metastases are not eligible. However, patients with bone metastases only who have positive bone scans will be eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: Groupwide, 62 patients have been entered on this study with 23 evaluable. One complete remission, eight partial responses and six patients with stable disease have been documented.
Objective(s): 1) To determine the response rate and response duration of refractory multiple myeloma treated with low dose 2'Deoxycoformycin used in a single dose, every two week schedule.

2) To define the qualitative and quantitative toxicities of 2'Deoxycoformycin administered in a Phase II study.

Technical Approach: 2'Deoxycoformycin is intended for therapy of patients with multiple myeloma who have had prior exposure to and progression of disease on protocols of higher priority. All patients must have a pathologically verified histologic diagnosis of multiple myeloma. Only symptomatic patients or those with demonstrated progressive disease are eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: Fifteen patients are evaluable. There has been some renal toxicity in a few patients but no other major toxicity. No responses have been observed.

Number of Subjects Enrolled During Reporting Period: 0
Total Number of Subjects Enrolled to Date: 3
Date of Periodic Review Results

Objective(s):
1) To determine the antitumor activity as determined by response rate and duration of response of L-Alanosine used on a three day, every three week schedule in patients with metastatic carcinoma of the breast who have failed on standard therapy.

2) To determine the nature and degree of toxicity of L-Alanosine.

Technical Approach: All patients with metastatic carcinoma of the breast resistant to standard chemotherapeutic agents are eligible. Patients must have measurable or evaluable disease and a life expectancy of at least nine weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: Thirty-five patients were entered onto this Phase II trial. Toxicity was mild. There were apparently no significant responses.
Objective(s): 1) To determine the toxicity of 5-fluorouracil (5-FU) and folinic acid (CF) therapy in patients with metastatic colorectal carcinoma.

2) To determine the response-rate in previously untreated patients receiving 5-FU and folinic acid.

Technical Approach: Patients must have clinically measurable disease to qualify for this study. They must have biopsy-proven adenocarcinoma arising from the colon or rectum. Obstructive lesions in the colon and rectum must have been bypassed or adequately maintained by decompression measures.

Therapy will follow the schema outlined in the study protocol.

Progress: One hundred twenty-eight patients have been randomly assigned to the two treatment arms. Of the 30 fully evaluable patients treated by constant infusion 5-FU, 7 or 23% had an objective partial response. In the 31 fully evaluable patients treated by 5-FU bolus there were 8 responses or 25%. Survival for the two arms is essentially identical.

**Objective(s):**  
1) To obtain data regarding the activity and toxicity of combination cis-platinum and dichloromethotrexate in patients with objectively measurable metastatic transitional cell carcinoma of the bladder who have good renal function and who have not previously received chemotherapy.  

2) To investigate the single agent activity and toxicity of dichloromethotrexate in previously untreated patients with impaired renal function.

**Technical Approach:** Eligible patients must have a histologically confirmed diagnosis of metastatic transitional cell carcinoma of the urothelium. Only patients without prior systemic chemotherapy are eligible for this study. Patients with prior radiotherapy are eligible if the disease has progressed, if at least six weeks have elapsed since completion of the radiotherapy (non-cranial) and if measurable sites of disease exist outside of the previous radiation field.

Therapy will follow the schema outlined in the study protocol.

**Progress:** Twenty-five patients have been entered on this study, 17 on the cis-platinum plus dichloromethotrexate and 8 on the dichloromethotrexate alone arm. In the combination arm, there has been one complete response and three partial responses in eight patients. There have been no responses on the dichloromethotrexate alone arm.

---

**Objective(s):**

1) To determine whether combination hormonal therapy with Aminoglutethimide and Hydrocortisone (AH) plus Megestrol Acetate (M), agents thought to have different mechanisms of action, offers an improved response rate with prolonged response duration and increased patient survival over the sequential use of each agent in Estrogen Receptor (ER) positive patients who have progressed after responding to primary hormonal treatment with Tamoxifen.

2) To assess the relative toxicities of Megestrol Acetate and medical adrenalectomy.

3) To assess the value of progesterone receptor (PgR) in predicting subsequent responses to a variety of hormonal therapies.

**Technical Approach:** Postmenopausal female patients with progressive, measurable metastatic breast carcinoma are eligible. Patients must have received an adequate trial of tamoxifen therapy and achieved at least a partial response in all areas of measurable disease.

Therapy will follow the schema outlined in the study protocol.

**Progress:** Patient accrual has been extremely poor. There have been no significant toxicities or other problems.

Objective(s): 1) To determine the response rate and remission duration of relapsing or refractory chronic lymphocytic leukemia treated with Fludarabine Phosphate used in a daily times five, every four week schedule.

2) To define the qualitative and quantitative toxicities of Fludarabine Phosphate in a Phase II study in this population.

Technical Approach: All patients must have a diagnosis of relapsing or refractory adult chronic lymphocytic leukemia which requires a peripheral count of greater than 15,000 lymphocytes/ l with >40% lymphocytes in the marrow. To be eligible for this protocol, patients with CLL must have bone marrow failure or progressive disease no responding to a prednisone-containing combination.

Therapy will follow the schema outlined in the study protocol.

Progress: Of seven patients evaluable, four have shown evidence of a partial remission.
Objective(s): 1) To determine the antitumor activity of Fludarabine Phosphate in patients with colorectal by determination of the response-rate and remission duration.

2) To further define the qualitative and quantitative toxicities of this drug in a Phase II study.

Technical Approach: Patients must have clinically measurable recurrent or disseminated disease to qualify for the study. Patients must have a life expectancy of at least ten weeks. Patients must not have received any prior chemotherapy and must not be receiving concomitant radiation therapy or hormonal therapy while on this study.

Therapy will follow the schema outlined in the study protocol.

Progress: There have been 22 patients entered into this study. Of the 5 evaluable patients, 2 patients have no response and 3 have increasing disease. This study has been closed to new entries.
Title: The Intergroup Adult Adjuvant Soft Tissue Sarcoma Study Protocol #2: A Randomized Trial of Adjuvant Doxorubicin (Adriamycin) vs Standard Therapy.

Start Date: 10 Jun 83

Principal Investigator: Glenn M. Mills, M.D., MAJ, MC

Facility: Brooke Army Medical Center

Dept/Svc: Department of Medicine/Oncology

Associate Investigators: Walter H. Harvey, M.D., MAJ, MC

Key Words: Soft tissue sarcoma

Objective(s):
1) To evaluate the effectiveness of adjuvant chemotherapy in improving the local control rate in inoperable, unresectable or incompletely resected soft tissue sarcomas treated with radiotherapy.
2) To determine the effect of adjuvant chemotherapy on the incidence of metastases, disease-free interval and survival.
3) To evaluate tolerance (with emphasis on local tissue tolerance in the irradiated area) to combined chemotherapy and radiation therapy.

Technical Approach: Eligible patients must have histopathologically proven diagnosis of soft tissue sarcoma. Patients with localized sarcomas, newly diagnosed or recurrent after previous surgery who are not candidates for curative surgical resection, or who have residual tumor following an incomplete surgical resection will be candidates for the study.

Therapy will follow the schema outlined in the study protocol.

Progress: No reportable data are available at this time.
Objective(s): 1) To determine the safest excision margins around the primary melanoma.

2) To evaluate the management of the regional lymph nodes (immediate vs delayed lymphadenectomy).

3) To evaluate the relative prognostic value of various histopathological parameters of melanoma.

Technical Approach: Patients with primary malignant melanomas of the skin measuring 1.0 to 4.0 mm thick with clinical stage I disease will be eligible for this trial. Patient must have a life expectancy of at least ten years from the time of diagnosis to permit long-term evaluation and follow-up.

Therapy will follow the schema outlined in the study protocol.
Title: Evaluation of AT-125 and Fludarabine Phosphate in Central Nervous System Tumors, Phase II.

Start Date: 26 Apr 85

Principal Investigator
Glenn M. Mills, M.D., MAJ, MC

Dept/Svc
Department of Medicine/Oncology

Key Words:
Central Nervous System Tumors

Objective(s):
1) To determine the efficacy of AT-125 (Acivicin) and Fludarabine Phosphate given on a dialy times five schedule for the treatment of malignant gliomas by determination of response rate, duration and survival.

2) To determine the qualitative and quantitative toxicities of AT-125 and Fludarabine Phosphate in this randomized Phase II setting.

3) To determine the salvage response rate of AT-125 or Fludarabine Phosphate in malignant gliomas failing one of these two agents.

Technical Approach: All patients who have a histologically confirmed diagnosis of malignant glioma will be eligible. Patients must have recurrent or residual measurable disease. All patients should have received adequate prior radiation therapy.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study. No reportable data are available.
Objective(s): 1) To determine the anti-tumor activity of Eosorubicin (4'deoxydoxorubicin) in patients with metastatic or recurrent epithelial carcinomas of the ovary who have failed on higher priority treatment protocols.

2) To define the qualitative and quantitative toxicities of Eosorubicin administered in a Phase II study.

Technical Approach: All patients must have a histopathologically verified diagnosis of incurable advanced metastatic or recurrent epithelial carcinoma of the ovary and must have failed primary therapy. Patients must have a life expectancy of at least 8 weeks and a performance status 0-2.

Therapy will follow the schema outlined in the study protocol.

Progress: Too few patients have been entered to allow evaluation.
**Objective(s):**

1) To determine the response rate and remission duration in patients with advanced squamous cell carcinoma of the head and neck treated with Fludarabine Phosphate.

2) To define further the qualitative and quantitative toxicities of Fludarabine Phosphate.

**Technical Approach:** Patients must have a verified histologic diagnosis of squamous cell carcinoma of the head and neck region. All patients must have measurable disease.

Therapy will follow the schema utlined in the study protocol.

**Progress:** This is a new study. No reportable data are available at this time.

**Results**

**Objective(s):**
1) To determine the response rate and response duration of malignant lymphoma treated with Esorubicin.

2) To define the qualitative and quantitative toxicities of Esorubicin administered in a Phase II study.

**Technical Approach:** All patients must have a pathologically verified histologic diagnosis of malignant lymphoma. Patients must have a life expectancy of more than 8 weeks and must have evaluable disease.

Therapy will follow the schema outlined in the study protocol.

**Progress:** This is a new study. No reportable data are available.
**Title:** Evaluation of CBDCA in Advanced Endometrial Carcinoma, Phase II

**Start Date:** 26 Oct 84  
**Est Comp Date:**  
**Principal Investigator:** Glenn M. Mills, M.D., MAJ, MC  
**Facility:** Brooke Army Medical Center  
**Dept/Svc:** Department of Medicine/Oncology  
**Associate Investigators:** Walter H. Harvey, D.O., MAJ, MC  
**Key Words:** Endometrial Carcinoma

**Objective(s):**
1. To determine the response rate, duration of response, and survival of patients with advanced endometrial carcinoma treated with CBDCA [1,1-cyclobutane-dicarboxylato-(2)-0,0'-(SP-4-2) platinum, NSC-241240].
2. To assess the toxicity of CBDCA in patients who have received no prior chemotherapy.

**Technical Approach:** Patients with histologically proven measurable metastatic or locally recurrent endometrial carcinomas are eligible for entry. Patients must have relapsed following primary treatment with surgery or radiotherapy plus surgery or have obvious metastatic disease at the time of diagnosis. All patients must have a performance status of 0-2 and an expected survival of at least six weeks.

Therapy will follow the schema outlined in the study protocol.

**Progress:** This is a new study. No reportable data are available.
Title: Evaluation of Fludarabine Phosphate in Refractory Multiple Myeloma, Phase II.

Objective(s): 1) To determine the response rate and response duration to Fludarabine Phosphate in patients with refractory multiple myeloma when treated on a daily times five, every three week schedule.

2) To define the qualitative and quantitative toxicity of Fludarabine Phosphate in a Phase II setting.

Technical Approach: All patients must have a pathologically verified histologic diagnosis of multiple myeloma. Fludarabine phosphate is intended for therapy of patients with multiple myeloma who have had prior exposure to, and progression of disease on, protocols of higher priority. Patients must have measurable disease and must not have received either radiation therapy or chemotherapy for at least three weeks prior to beginning therapy with fludarabine phosphate.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study. No reportable data are available at this time.

Objective(s): 1) To determine an approximate complete remission rate and remission duration for the treatment program of cyclophosphamide, doxorubicin, vincristine, dexamethasone, and bleomycin with intervening moderate dose methotrexate and leukovorin rescue (m-BACOD), in patients with intermediate and high grade non-Hodgkin's lymphoma.

2) To assess the feasibility of using this regimen in the Southwest Oncology Group with the intent of using m-BACOD in a future Phase III trial.

Technical Approach: Patients with biopsy proven Stage II-IV non-Hodgkin's lymphoma are eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: Groupwide, 93 patients have been registered. The initial response rate appears to be quite high, in the range of 70%.

1) To determine the antitumor activity of Tamoxifen in meningiomas not amenable to surgery or radiotherapy.  
2) To estimate the response rate and response duration experienced by these patients.  

**Technical Approach:** All patients must have a biopsy-proven diagnosis of benign meningioma and measurable disease by CT scan or NMR scan. Patients must have documented recurrence not amenable to radiation therapy or documented growth after definitive radiation therapy. Patient's tumor must be unresectable for medical or technical reasons, or have measurable residual disease.  

Therapy will follow the schema outlined in the study protocol.

**Progress:** This is a new study. No reportable data are available at this time.
Title: Evaluation of Two Consolidation Regimens in the Treatment of Adult Acute Lymphoblastic Leukemia, Phase III

Objective(s):
1) To compare the effects on remission duration and survival of two consolidation regimens: the L10-M consolidation used in SWOG 8001 versus a regimen employing Daunomycin, Cytosine Arabinoside, 6-Thioguanine and escalating Methotrexate/L-Asparaginase in patients with adult acute lymphoblastic leukemia.

2) To compare the toxicities of the two consolidation regimens.

Technical Approach: All patients must have a diagnosis of acute lymphoblastic leukemia. Patients must have no evidence of serious liver or renal dysfunction defined as a bilirubin and creatinine greater than the institutional normals.

Therapy will follow the schema outlined in the study protocol.

Progress: Emergency approval was obtained to enter one patient upon this study. It is too early to report any meaningful results.

Number of Subjects Enrolled During Reporting Period: 2
Total Number of Subjects Enrolled to Date: 2
Date of Periodic Review n/a  Results

Objective(s):
1) To determine the overall and complete response rates to the combination of Cyclophosphamide, VP-16 (Etoposide) and Cis-platinum followed by Vincristine, plus prophylatic or therapeutic whole brain and chest irradiation in responders in extensive small cell carcinoma of the lung.

2) To assess qualitative and quantitative toxicities of this treatment program.

3) To measure time to progression and survival of the patients treated.

Technical Approach: All patients must have a histologic diagnosis (either by bronchoscopic biopsy or surgical biopsy) or unequivocal cytologic diagnosis of undifferentiated, small cell carcinoma by light-microscopic criteria. Patients must have evidence of extensive stage disease.

Progress: Groupwide, there have been 11 registrations, with eight patients evaluable for toxicity. No unusual toxicity has been seen. Seven patients have responded.
Objective(s): 1) To determine the number of patients aged 55 and over with unfavorable histology non-Hodgkin's lymphoma who are treated at the participating institutions.

2) To determine the number of patients not entered on Southwest Oncology Group treatment protocols and the reasons why.

3) To compile baseline information on the natural history of such patients.

4) To evaluate the quality of life of these patients.

Technical Approach: Patients with Stage II-IV, histologically proven "poor prognosis" non-Hodgkin's lymphoma will be eligible. Patients must be age 55 or over.

Progress: Participating institutions were urged to register all patients over age 55.

**Objective(s):** To study differences in morbidity and patient survival as functions of various tumor growth patterns as well as treatments.

**Technical Approach:** All patients with primary, previously untreated, histologically confirmed invasive carcinoma of the endometrium Stage I and Stage II occult, all grades, with one or more of the following high risk criteria are eligible: (1) all lesions equal to or greater than one-half myometrial involvement; (2) positive pelvic and/or para-aortic nodes; (3) microscopic evidence of cervical involvement but no gross clinical involvement of the cervix. The following types of histologically confirmed uterine carcinoma are eligible: adenocarcinoma, adenoscarcina, adenosquamous carcinoma.

Therapy will follow the schema outlined in the study protocol.

**Technical Approach:** Two patients remain on the study and are responding well.
**Objective(s):** To determine the incidence of pelvic and aortic lymph node metastases associated with Stage I and II uterine sarcomas, the relationship of these node metastases to other important prognostic factors such as mitotic index of the tumor, and the complication rate of the procedures.

**Technical Approach:** All patients with histologically proven uterine sarcoma clinical Stage I and II who are medically suitable for hysterectomy and lymphadenectomy are eligible for the study.

Therapy will follow the schema outlined in the study protocol.

**Progress:** No patients have been entered on this study.
Date: 11 Sept. 85  Proj No: GOG 41  Status: Ongoing

Title: Surgical Staging of Ovarian Carcinoma.

Start Date FY 79  Est Comp Date:
Principal Investigator  Facility
Danny R. Barnhill, M.D., MAJ, MC  Brooke Army Medical Center
Dept/Svc GYN-ONC SVC.  Associate Investigators:
Department of Obstetrics-Gynecology

Key Words:
Carcinoma, ovarian

Accumulative MEDCASE Cost:
Est Accumulative OMA Cost:
Number of Subjects Enrolled During Reporting Period:
Total Number of Subjects Enrolled to Date: 1
Date of Periodic Review Results

Objective(s): 1) To determine the spread of ovarian carcinoma in intraperitoneal structures and retroperitoneal lymph nodes by direct examination, cytologic sampling, and biopsy.

2) To establish a surgical protocol for patients entered into GOG ovarian cancer treatment protocols.

3) To determine the complication rate of the procedures.

Technical Approach: Patients with all histologic types of primary ovarian cancer are eligible, including epithelial tumors, germ cell tumors, stromal tumors, and all others. Patients must be entered within two weeks of the last surgery.

Therapy will follow the schema outlined in the study protocol.

Progress: One patient entered on this study continues to do well.
Objective(s): 1) To evaluate the effect of combine prophylactic vincristine, dactinomycin, and cyclophosphamide chemotherapy in patients with endodermal sinus tumor, embryonal carcinoma, immature teratoma (Grades 2 and 3), choriocarcinoma, and malignant mixed germ cell tumors of the ovary, Stages I and II after total removal of all gross tumor.

2) To evaluate the role of serum markers, especially alpha-fetoprotein (AFP) and human chorionic gonadotropin (beta HCG), when these are present, in predicting response and relapse.

3) To determine the role of restaging laparotomy in determining response, predicting relapse and planning further therapy.

Technical Approach: Patients with histologically confirmed malignant germ cell tumors of the ovary, Stage I or II, if previously untreated and completely resected, excluding patients with pure dysgerminoma unless classified as anaplastic, or eligible. Patients with grade 2 or 3 immature teratoma are also eligible. Patients with early Stage III disease will be accepted if all gross tumor is resected.

Therapy will follow the schema outlines in the study protocol.

Progress: No patients have been registered on this protocol.
Objective(s): To evaluate the effect of four cycles of combined Vinblastine, Bleomycin, and Cis-Platinum (VBP) chemotherapy in the management of patients with endodermal sinus tumor, embryonal carcinoma, immature teratoma (all grades), choriocarcinoma, and malignant germ cell tumors of the ovary with advanced or recurrent disease, incompletely resected.

Technical Approach: Patients with histologically confirmed malignant germ cell tumors of the ovary with advanced (Stage III-IV) or recurrent disease, incompletely resected, excluding patients with pure dysgerminoma (mature or anaplastic) are eligible. Patients with incompletely resected Stage II disease and patients previously treated with Vinblastine, Dactinomycin and Cyclophosphamide are also eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: One patient has been enrolled on this study continues to do well.
Title: A Study of Progestin Therapy and a Randomized Comparison of Adriamycin vs Adriamycin + Cyclophosphamide in Patients with Advanced Endometrial Carcinoma After Hormonal Failure, Phase III.

Objective(s): 1) To evaluate the response of advanced or recurrent endometrial carcinoma to oral progestins in patients who have received no prior hormonal therapy.

2) To compare a combination of adriamycin and cyclophosphamide to adriamycin alone as therapy for advanced or recurrent endometrial carcinoma which no longer responds to or has failed to respond to progestins in patients who have received no prior cytotoxic drugs.

Technical Approach: To be eligible for entry on this study, all patients must have documented primary Stage III, primary Stage IV, recurrent or residual endometrial adenocarcinoma, adenoscarcinosma or adeno-squamous carcinoma. Those patients with positive cytology as evidence of spread are eligible as non-measurable disease cases.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been entered on this study.
Title: A Surgical-Pathologic Study of Women with Invasive Carcinoma of the Cervix Stage IB and Randomly Assigned Radiation Therapy versus no Further Therapy in Selected Patients.

Objective(s): 1) To determine by observations of the 5-year survival and disease-free interval, the validity of current FIGO staging to the histopathologic prognostic factors of size of lesion, location of lesion, depth of invasion of tumor, histology and grade, growth pattern, and site and number of positive lymph nodes in Stage IB carcinoma of the cervix.

2) To rapidly accumulate prospectively significant surgical pathologic data which would expedite development of further protocols.

3) To determine morbidity of primary radical surgical therapy.

4) To determine if radiation therapy will improve survival in selected patients with positive nodes.

Technical Approach: All patients with primary, previously untreated, histologically confirmed, invasive carcinoma of the cervix (squamous cell, adenocarcinoma and adenosquamous) are eligible. Patients must have had a pelvic and para-aortic lymphadenectomy.

Progress: No patients have been registered on this study.

**Objective(s):** To determine in "optimal" Stage III ovarian adenocarcinoma, if the addition of Adriamycin to cyclophosphamide plus platinol improves progression-free interval, frequency of negative second-look laparotomy and survival.

**Technical Approach:** Patients with proven primary Stage III ovarian adenocarcinoma (serous, mucinous, endometrioid, undifferentiated carcinoma, mixed epithelial carcinoma or clear cell) confined to the abdominal cavity and its peritoneal surfaces with residual tumor masses after surgery no larger than 1 cm in diameter are eligible. Entry must be no more than six weeks postoperative. Therapy will follow the schema outlined in the study protocol.

**Progress:** Two patients entered on this study continue to do well.

Key Words:
Ovarian Stroma

Objective(s):
1) To evaluate the effectiveness of combined vincristine, dactinomycin and cyclophosphamide (VAC) in treatment of malignant tumors of the ovarian stroma in patients with residual, recurrent or advanced disease.

2) To confirm completeness of response to VAC treatment with restaging laparotomy.

3) To evaluate the endometrium histologically to learn more about the relationship between stromal tumors and endometrial cancer.

4) To learn more about hormonal effects in patients with stromal tumors.

Technical Approach: All patients with histologically confirmed malignant tumors of the ovarian stroma not amenable to cure by further surgery or radiation therapy are eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study. No patients have been entered on this study.
Title: Hormonal Contraception and Trophoblastic Sequelae after Hydatidiform Mole (Phase III).

Objective(s): The objective of this study is to determine whether the administration of estrogen-progesterone oral contraceptives following the evacuation of a hydatidiform mole, and prior to the HCG titer reaching undetectable levels, affects the incidence of Trophoblastic sequelae requiring chemotherapy.

Technical Approach: All patients with a histologically verified diagnosis of hydatidiform mole evacuated by suction evacuation are eligible.

Progress: This is a new study. No patients have been entered on this study.
Date: 11 Sept. 85  Proj No: GCIC 56  Status: Ongoing
Title: A Randomized Comparison of Hydroxyurea vs Misonidazole as an Adjunct to Radiation Therapy in Patients with Stages IIB, III, and IVA Carcinoma of the Cervix and Negative Para-Aortic Nodes.

| Start Date | Nov 81 | Est Comp Date: |
| Principal Investigator | Facility |
| Danny R. Barnhill, M.D., MAJ, MC | Brooke Army Medical Center |
| Dept/Svc | Associate Investigators: |
| Department of Obstetrics-Gynecology | |
| Key Words: | |
| Carcinoma, cervix | |

Objective(s): 1) To determine whether hydroxyurea or misonidazole is superior as a potentiation of radiation therapy in advanced cervical cancer.

2) To compare the toxicity of hydroxyurea vs misonidazole when given concurrently with radiotherapy.

Technical Approach: All patients with primary, previously untreated histologically confirmed invasive squamous cell carcinoma of the uterine cervix, clinical stages IIB through IVA confined to the pelvis, will be eligible for this study.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been enrolled in this study.
Title: A Randomized Comparison of Multiple Agent Chemotherapy with Methotrexate, Dactinomycin, and Chlorambucil versus the Modified Bagshawe Protocol in the treatment of "Poor Prognosis" Metastatic Gestational Trophoblastic Disease (Phase III)

Objective(s): 1) To evaluate the effectiveness and toxicity of the Modified Bagshawe Protocol (MBP) in patients with "poor prognosis" metastatic gestational trophoblastic disease.

2) To compare the effectiveness and toxicity of the MBP with the standard triple agent chemotherapy with methotrexate, dactinomycin, and chlorambucil (MAC).

Technical Approach: All eligible patients with a diagnosis of gestational trophoblastic disease and an elevated HCG titer, who are considered "poor prognosis" on the basis of any of the following criteria: 1) Duration of disease greater than four months from the antecedent pregnancy. 2) Pre-treatment, 24-hour urinary HCG titer of 100,000 I.U./L or above, or serum Beta-subunit HCG-RIA titer of 42,000 mIU/ml or above. 3) Hepatic and/or cerebral metastases. 4) Metastatic gestational trophoblastic disease following term pregnancy. 5) Failure of response to prior single-agent therapy.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study. No patients have been entered.
Title: A Randomized Comparison of Extended Field Radiation Therapy and Hydroxyurea Followed by Cisplatin or No Further Therapy in Patients with Cervical Squamous Cell Carcinoma Metastatic to High Common Iliac...Lymph Nodes, Phase III.

Start Date: Nov 81

Principal Investigator: Danny R. Barnhill, M.D., MAJ, MC

Department of Obstetrics-Gynecology

Key Words: Carcinoma, cervix

Objective(s): To determine if cis-diaminedichloroplatinum, cisplatin, given in an adjuvant setting will decrease the risk of geographic failure or improve the survival rate of progress-free interval in patients with squamous carcinoma of the cervix with metastases to high common iliac and/or para-aortic lymph nodes, proven by either histologic or cytologic means.

Technical Approach: All patients with primary, previously untreated, histologically confirmed, invasive squamous cell carcinoma of the uterine cervix, all clinical stages, with metastasis to high common iliac or para-aortic lymph nodes proven by cytologic or histologic means are eligible for this study.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been registered on this study.
Date: 11 Sept. 85  Project: GOG 60  Status: Ongoing

Title: A Randomized Study of Doxorubicin plus Cyclophosphamide plus Cisplatin vs Doxorubicin plus Cyclophosphamide plus Cisplatin plus BCG in Patients with Advanced Suboptimal Ovarian Adenocarcinoma, Stage III and IV.

Start Date: Nov 81  Est Comp Date: 

Principal Investigator: Danny R. Barnhill, M.D., MAJ, MC
Facility: Brooke Army Medical Center

Dept/Svc: Department of Obstetrics-Gynecology
Associate Investigators:

Key Words:
Adenocarcinoma, ovary

Objective(s):
1) To determine if the addition of BCG to doxorubicin (adriamycin) plus cyclophosphamide plus cisplatin improves remission rate, remission duration or survival in suboptimal Stage III and IV ovarian adenocarcinoma.

2) To determine the frequency and duration of true complete remission using these regimens as judged at second-look laparotomy.

Technical Approach: Patients with established suboptimal Stage III and IV ovarian epithelial cancer are eligible. All patients must have optimal surgery and appropriate tissue for histologic evaluation, as detailed in protocol GOG 41.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been entered on this study.

Date: 11 Sept. 85             Proj No: GOG 61             Status: Ongoing

Title: Randomized Study of Cis-platinum + Cyclophosphamide vs Hexamethylmelamine after Second-Look Surgery in Nonmeasurable Stage III Ovarian Adenocarcinoma Partially Responsive to...Cis-platinum and Cyclophosphamide.

Start Date: Nov 81

Principal Investigator: Danny R. Barnhill, M.D., MAJ, MC
Facility: Brooke Army Medical Center

Dept/Svc: Department of Obstetrics-Gynecology

Associate Investigators:

Key Words:
Adenocarcinoma, ovary

Accumulative MEDCASE Cost: Est Accumulative OMA Cost:

Number of Subjects Enrolled During Reporting Period:

Total Number of Subjects Enrolled to Date:

Date of Periodic Review: Results:

Objective(s): To determine, in nonmeasurable but residual Stage III ovarian adenocarcinoma partially responsive after treatment with regimens containing cis-platinum and cyclophosphamide, if the progression-free interval and survival are improved by continuing cyclophosphamide plus cisplatinum or by changing treatment to hexamethylmelamine.

Technical Approach: Patients who have been diagnosed as Stage III ovarian cancer and who have had residual disease found at second-look laparotomy may be eligible. A patient who began with measurable disease and achieved a clinical complete response, but then at second look was found to have residual disease after treatment with regimens containing cis-platinum and cyclophosphamide, would be eligible. A patient who originally had nonmeasurable disease and who at the time of second look has less volume of disease than was described at the time of the original surgery or in whom there has been no change in the volume of disease would be eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been registered on this study.
Objective(s): 1) To evaluate the sensitivity and specificity of non-invasive procedures such as sonography, computerized axial tomography (CAT or CT), and lymphangiography in detection of metastases.

2) To better understand the significance of various surgical and pathologic factors involved in staging and therapy for "advanced" cervical cancer. The accumulated clinical/surgical/pathological data may then play a role in modification or design of future protocols.

Technical Approach: All patients with primary, previously untreated, histologically confirmed invasive carcinoma of the uterine cervix, clinical stages IIB through IVA, all cell types, will be eligible for this study.

Progress: This is a new study. No patients have been entered.
Detail Summary Sheet

Date: 13 Sept 85
Proj No: GOG 64
Status: Closed

Title: A Randomized Comparison of Rapid versus Prolonged Infusion of Cisplatin in Therapy of Squamous Cell Carcinoma of the Cervix (Phase III)

Start Date FY 85
Principal Investigator: Danny R. Barnhill, M.D., MAJ MC
Dept/Svc: Gyn–Oncology Service
Department of Obstetrics–Gynecology

Facility: Brooke Army Medical Center

Associate Investigators:

Key Words:
Squamous Cell Carcinoma, Cervix

Objective(s):
1) To determine whether the frequency and duration of objective response of squamous cell carcinoma of the cervix is altered significantly by prolonging to 24 hours the duration of the infusion of a dose of cisplatin, as compared to administration at a rate of 1 milligram per minute.

2) To determine whether administration of a dose of cisplatin as a continuous 24-hour infusion alters the frequency and/or severity of drug–related nausea and vomiting, as compared to administration of the same dose at a rate of 1 milligram per minute.

Technical Approach: Patients who have histologically confirmed, locally advanced, recurrent, persistent, or metastatic squamous cell carcinoma of the cervix, which is resistant to curative treatment with surgery or radiotherapy.

Progress: This study was closed by GOG before any patients were enrolled.

Number of Subjects Enrolled During Reporting Period:

Total Number of Subjects Enrolled to Date:

Date of Periodic Review Results:

Objective(s): 1) To determine the incidence of neuroendocrine carcinoma of the cervix in cases which are histologically classified as small cell carcinoma.
2) To determine the response rate to combination chemotherapy in patients with Stage IVB small cell carcinoma of the cervix and in patients with progressive local disease after radiation therapy.

Technical Approach: Patients with histologic diagnosis of small cell carcinoma of the cervix. A patient who has small cell carcinoma mixed with large cell keratinizing carcinoma or adenocarcinoma is eligible, providing that the small cell elements comprise 50 percent of the tumor. Only patients with primary Stage IVB disease (clinical or surgical) or recurrence in the pelvis after radiation therapy are eligible for chemotherapy after this study. Chemotherapy patients must have measurable disease (in two dimensions perpendicular to each other, by palpation or by an appropriate x-ray and/or ultra sound procedure.

Progress: This is a new study. No patients have been entered.
Title: A Randomized Comparison of Single-Agent Chemotherapy, Methotrexate and Methotrexate with Folic Acid Rescue, in "Good Prognosis" Metastatic Gestational Trophoblastic Disease, Phase III.

Facility
Brooks Army Medical Center

Dept/Svc
Department of Obstetrics-Gynecology

Associate Investigators:

Key Words:
Trophoblastic disease

Objectives:
1) To judge the relative efficacy of scheduling variation in the chemotherapeutic management of "good prognosis" metastatic trophoblastic disease.
2) To ascertain the relative toxicities of the two regimens.

Technical Approach: To be eligible for this study, patients must have metastatic gestational trophoblastic disease who are "good prognosis" with: 1) antecedent molar pregnancy, ectopic pregnancy, or abortion; 2) duration of disease less than 4 months from antecedent pregnancy; 3) metastatic disease present but no liver or brain metastasis. All patients must have had pelvic ultrasound to exclude intrauterine pregnancy.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been registered on this study.
Title: Treatment of Patients with Sub-Optimal ("Bulky") Stage IB Carcinoma of the Cervix: A Randomized Comparison of Radiation Therapy Versus Radiation Therapy plus Adjuvant Extravascular Hysterectomy (Phase III)

Objective(s):
1) Evaluation of the role of adjunctive extravascular hysterectomy in the treatment of suboptimal Stage IB carcinoma of the cervix with negative para-aortic and high common iliac nodes.
2) Evaluation of survival and patterns of failure in suboptimal IB cervical cancer.
3) The study of toxicity of a combined radiation and surgical therapeutic program.
4) Evaluation of the prognostic value of various surgical/pathological characteristics in suboptimal Stage IB carcinoma of the cervix.
5) To estimate the prevalence of various disease characteristics (e.g., positive para-aortic nodes) in suboptimal Stage IB carcinoma of the cervix.

Technical Approach: Patients with primary, untreated, histologically confirmed invasive carcinoma of the uterine cervix, suboptimal or bulky, FIGO Stage IB, as confirmed by cervical biopsy and endometrial sampling are eligible for this study. Treatment will follow that outlined in the study schema.

Progress: This is a new study. No patients have been entered.
Title: Ovarian Tumors of Low Malignant Potential: A Study of the Natural History and a Phase II Trial of Melphalan and Secondary Treatment with Cisplatin.

Objective(s): 1) To evaluate the biologic behavior of ovarian tumors of low malignant potential.

2) To evaluate the effectiveness of chemotherapy against this disease; initially, a Phase II study of melphalan.

3) To evaluate the response rate to cisplatin in melphalan failures.

Technical Approach: All patients with ovarian tumors considered to be in the pathology classification of low malignancy potential are eligible. Patients must have undergone adequate surgical staging and any stage of disease from I-IV inclusive.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been registered on this study

**Total Number of Subjects Enrolled to Date:** 0  
**Date of Periodic Review**

**Objective(s):** 1) To document the rates and patterns of recurrence of patients with early Stage I vulvar carcinoma treated with ipsilateral superficial inguinal lymphadenectomy and modified radical hemivulvectomy. 2) To document the survival and recurrence-free interval in the same group of patients.

**Technical Approach:** All patients with primary, untreated, histologically confirmed squamous cell carcinoma of the vulva, Stage I, will be eligible for surgical treatment as "early superficially invasive carcinoma of the vulva" if: 1) a wide local excision with normal skin margins greater than 2 cm be performed. 2) There is only a single malignant lesion which measures 2 cm or less by largest diameter in vivo.

Therapy will follow the schema outlined in the study protocol.

**Progress:** This is a new study. No patients have been entered on this study.
Title: Postoperative Pelvic Radiation in Stage I and II Mixed Mesodermal Tumors of the Uterus (Phase III)

Objective(s): To determine whether pelvic postoperative radiation therapy will decrease local and regional recurrence rates and improve median progression-free interval in patients with Stage I and II mixed mesodermal sarcomas of the uterus.

Technical Approach: Patients with primary clinical Stage I and II mixed mesodermal tumors of the uterus who have been entered on Protocol 40 and found to have disease confined to the pelvis which has been grossly resected.

Randomization and therapy will follow the schema outlined in the study protocol.

Progress: This is a new study. No patients have been entered on this study.
Title: Evaluation of Adjuvant Vinblastine, Bleomycin and Cisplatin Therapy in Totally Resected Choriocarcinoma, Endodermal Sinus Tumor, or Embryonal Carcinoma of the Ovary.

Start Date: 25 Sep 84

Objective(s):
1) To evaluate the effect of adjuvant vinblastine, bleomycin, and cisplatin (VBP) chemotherapy in patients with endodermal sinus tumor and choriocarcinoma of the ovary (pure and mixed) after removal of all gross tumor.

2) To evaluate the role of serum markers, especially alpha fetoprotein (AFP), and human chorionic gonadotropin (HCG) when these are present initially in predicting recurrence.

3) To evaluate the role of reassessment laparotomy in determining response, detecting early relapse and planning further therapy.

4) To compare the biologic behavior of pure endodermal sinus tumors with mixed germ cell tumors containing endodermal sinus elements.

Technical Approach: Patients with histologically confirmed Stage I choriocarcinoma, endodermal sinus tumor or embryonal carcinoma of the ovary, pure or mixed with other elements, if totally resected are eligible. Patients with Stage II and Stage III disease are also eligible if all gross tumor has been resected. The serum AFP and beta-HCG levels should be normal or falling at a rate that does not suggest residual disease.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been registered on this study.

**OMA Cost:**

**Number of Subjects Enrolled During Reporting Period:** 3

**Total Number of Subjects Enrolled to Date:** 6

**Date of Periodic Review** 24 Dec 84  | **Results Continue**

**Objective(s):** To evaluate the effectiveness of a program of sequential systemic chemotherapy plus CNS treatment for children with untreated T-cell leukemia.

**Technical Approach:** Patients under the age of 21 with a diagnosis of T-cell leukemia as defined by SWOG 7865 including all patients who have 20% or greater E-rosetting leukemia cells are eligible.

Therapy will follow the schema outlined in the study protocol.

**Progress:** Four patients remain on the study. All are doing well.
Objective(s): To compare two forms of treatment, the duration of disease control, and side effects of the treatment program.

Technical Approach: Patients under 21 years of age with the diagnosis of rhabdomyosarcoma (any of the four cellular types plus the special undifferentiated types and small cell mesenchymal sarcoma) or undifferentiated sarcoma, type indeterminate, are eligible for this study.

Therapy will follow the schema outlined in the study protocol.

Progress: This study has been closed to new entries.
Date: 23 Oct 85  Proj No:  POG 7901  Status: Ongoing

Title: Rescue Therapy for Non-CNS Extramedullary Disease in Children with Acute Lymphoblastic Leukemia, Phase III

Start Date 27 Jan 83  Est Comp Date:

Total Number of Subjects Enrolled to Date:  2

Date of Periodic Review 14 December 1985  Results Continue

Objective(s): To administer effective local therapy for non-CNS extramedullary disease occurring during marrow remission or marrow relapse in children with acute lymphocytic leukemia (ALL).

Technical Approach: Children less than 21 years of age at time of diagnosis, with ALL are eligible for EMD "rescue" therapy when the diagnosis of EMD has been established.

Therapy will follow the schema outlined in the study protocol.

Progress: Two patients remain on the study. No reportable data are available.
Title: Evaluation of MOPP Adjuvant Chemotherapy in the Treatment of Localized Medulloblastoma and Ependymoma.

Start Date: May 81

Principal Investigator: Terry E. Pick, M.D., LTC, MC

Dept/Svc: Department of Pediatrics

Key Words: Medulloblastoma, Ependymoma

Accumulative MEDCASE Cost: OMA Cost:

Number of Subjects Enrolled During Reporting Period: 1
Total Number of Subjects Enrolled to Date: 2
Date of Periodic Review: 14 December 1985

Objective(s): To evaluate the efficacy and toxicity of the MOPP adjuvant chemotherapy in the prevention of local recurrence of distant metastasis in children with localized medulloblastoma and ependymoma.

Technical Approach: Patients between 1 and 21 years (inclusive) with histologically proven medulloblastoma and ependymoma are eligible for the study.

Therapy will follow the schema outlined in the study protocol.

Progress: Two patients have been entered into this study. Both have responded fairly well to therapy.
Date: 23 Oct 85  Proj No:  POG 8000
Title: National Wilms' Tumor Study, III

Start Date 25 Sep 81  Est Comp Date:  
Principal Investigator  Facility  
Terry E. Pick, M.D., LTC, MC  Brooke Army Medical Center
Dept/Svc  Associate Investigators:  
Department of Pediatrics  
Key Words:  Wilms' tumor

Accumulative MEDCASE  Est Accumulative  
Cost:  OMA Cost:  
Number of Subjects Enrolled During Reporting Period: 2
Total Number of Subjects Enrolled to Date: 4
Date of Periodic Review 14 December 1984  Results Continue

Objective(s): 1) To gain better understanding of Wilms' tumor by gathering detailed information regarding gross and histologic morphology.

2) To refine methods of treatment according to staging.

3) To test treatment hypotheses by randomized prospective clinical trials according to stage and histologic grade of disease.

4) To gather information about family cancer in an attempt to identify children and families at high risk.

5) To study the late consequences of successful treatment given for Wilms' tumor.

Technical Approach: Patients under the age of 15 with Wilms tumor are eligible.

Progress: Two patients remain on this study and are doing well.
Objective(s): 1) To determine if adding a high dose of a standard chemotherapy agent used in acute lymphocytic leukemia every 8 weeks and maintenance increases the chance of survival over the regular doses of standard chemotherapy drugs in the "good risk" patient.

2) To determine if one of three treatment regimens is better in treating the "poor risk" patient.

Technical Approach: Eligible patients will receive one of three treatment regimens. Regimen 1 consists of standard drugs given in the usual fashion with triple intrathecal medications given in the spinal fluid to prevent CNS leukemia for three years. Regimen 2 consists of the standard chemotherapy agents plus high dose Methotrexate pulses during maintenance with triple intrathecal medications given in consolidation, and low dose intrathecal Methotrexate given for one year. Regimen 3 consists of pulses of a variety of courses of different agents that are superimposed upon the routine maintenance therapy plus triple intrathecal medications for three years to determine if these pulses of different chemotherapy agents can improve the outcome of this high risk group.

Progress: Twelve patients remain on the study and thus far seem to be responding to therapy.

Key Words: Lymphoma, non-Hodgkin Leukemia
Accumulative MEDCASE Est Accumulative Cost: OMA Cost:
Number of Subjects Enrolled During Reporting Period: 2
Total Number of Subjects Enrolled to Date: 2
Date of Periodic Review 14 December 1985 Results Continue

Objective(s): 1) To compare marker data for T-leukemias with that from T-lymphomas to determine whether these entities represent clearly separate diseases, by immunological criteria, or whether they represent different clinical presentations of the same disease process.

2) To correlate the presence or absence of cell markers with clinical characteristics: age, sex, white count, organ involvement, etc., to determine whether any marker or immunologic T-subset may carry clinical prognostic significance.

Technical Approach: All newly diagnoses cases of acute lymphoblastic T-cell leukemia, with no previous chemotherapy, are eligible. Patients with non-Hodgkin lymphoma presenting with non-abdominal primary sites are likewise eligible.

Therapy for patients entered onto this study will be according to the Pediatric Oncology Group protocol priority.

Progress: Two patients have been enrolled on the study. No reportable data are available.

**Objective(s):**
1. To compare the remission rate and toxicity data of an intensive 3-drug regimen for acute nonlymphocytic leukemia (ANLL), utilizing cytosine arabinoside, Daunomycin and 6-thioguanine, with that observed using an anthracycline-free induction regimen that employs an identical schedule of cytosine arabinoside, but combined with vincristine and dexamethasone. To determine the effect, if any, of the induction regimen on remission duration.

2. To accumulate clinical and laboratory data regarding features present at diagnosis of ANLL, to relate this information to the behavior of the disease(s) under treatment, and to establish the natural history of the disease.

**Technical Approach:** Patients under 21 years of age presenting with the diagnosis of acute leukemia other than lymphoblastic are eligible. Randomization for the induction regimen will be by disease category (AML, AMML, APL, and other). All patients with APL will be placed on the anthracycline-containing induction and maintenance arms.

Therapy will follow the schema outlined in the study protocol.

**Progress:** No patients remain on this study due to poor response.
Objective(s): 1) To treat the tumor according to age and stage at which the tumor was diagnosed.

2) To reduce later complications by separating by age and stage those patients that require surgery only; surgery and chemotherapy; surgery, chemotherapy, and radiation therapy.

Technical Approach: Therapy will follow the schema outlined in the study protocol.

Progress: Five patients remain on the study and are responding fairly well.

**Number of Subjects Enrolled During Reporting Period:** 2  
**Total Number of Subjects Enrolled to Date:** 2  
**Date of Periodic Review:** 14 December 1984

**Objective(s):**

1) To determine complete remission rates, remission lengths and survival times for children with Murphy's Stages III and IV, diffuse nonlymphoblastic lymphomas using combination chemotherapy consisting of a vigorous prophylactic IT regimen, conventional doses of vincristine sulfate (VCR) and prednisone (Pred) and high doses of cyclophosphamide (CYT) and methotrexate (MTX) intravenously.

2) To document the toxicity and complications of this therapy.

**Technical Approach:** Patients under 21 years of age, newly diagnosed with Stage III or IV diffuse nonlymphoblastic lymphoma who have never received therapy are eligible.

Therapy will follow the schema outlined in the study protocol.

**Progress:** Two patients have been entered on this study. No reportable data are available at this time.
Objective(s): 1) To determine if intensive multi-agent chemotherapy given adjuvantly after surgical ablation of the primary tumor will significantly improve the disease-free survival (DFS) for patients with non-metastatic osteosarcoma when compared to a concurrent, non-adjuvantly treated control group.

2) To determine if freedom from second relapse and overall survival are different for patients treated with immediate postoperative adjuvant chemotherapy versus those treated with delayed adjuvant chemotherapy after relapse and metastasectomy.

Technical Approach: All patients with previously untreated osteosarcoma are eligible. The patient must have no metastases at diagnosis, determined by physical exam, chest CT scan, and bone scan.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study.

**Objective(s):**  
1) To determine if intensive early therapy with a 4-drug reinduction regimen immediately followed by consolidation therapy is more effective than reinduction regimens used in the past for patients with ALL or lymphoblastic lymphoma who relapse on or shortly following termination of initial continuation therapy.

2) To assess the efficacy and toxicity of continuous and alternating maintenance therapy during second remission with 2 drug pairs not used during first remission: VM-26 plus Ara-C and vincristine plus cyclophosphamide.

3) To determine the effectiveness and toxicity of periodic 4 drug reinduction therapy (reinforcement) throughout second remission.

**Technical Approach:** Patients less than 21 years of age who develop their first marrow relapse or overt clinical testicular relapse during initial continuation chemotherapy are eligible. Children with CNS relapse accompanying marrow and/or testicular relapse are also eligible.

**Therapy will follow the schema outlined in the study protocol.**

**Progress:** One patient has been entered on this study; however, it is too early to report any meaningful results.
Title: SIMAL #4. Combination Chemotherapy for Remission Induction and Maintenance for: 1) Recurrent Childhood Lymphocytic Leukemia After Elective Cessation of Therapy; 2) Children with Occult Testicular Leukemia After 3 Years of Continuous Complete Remission.

Key Words:  
Leukemia, lymphocytic

Objective(s): 1) To compare the effectiveness of two regimens of cyclic maintenance chemotherapy in children with ALL, who relapse 6 months or greater, after elective cessation of chemotherapy.

2) To evaluate the effectiveness of prophylactic intrathecal chemotherapy, during the second remission.

3) To compare the effectiveness of two regimens of cyclic maintenance chemotherapy in patients with testicular leukemia.

4) To determine the effectiveness of two regimens of cyclic maintenance chemotherapy in children with isolated CNS relapse.

Technical Approach: Patients less than 21 years of age with pathologic verification of leukemic relapse at any site more than six months after elective cessation of initial therapy are eligible. Children with their first CNS relapse are also eligible for this study.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study. No patients have been entered.

**Key Words:**
Lymphoma, Non-Hodgkin's

**Objective(s):**
1) To provide a mechanism for the group wide study of biologic characteristics of lymphoma cells, by acquisition and coordination of data from reference laboratories.

2) To seek correlates of biologic characteristics, with histopathology, clinical presentation, and end results of protocol therapies.

3) To attempt the development of a comprehensive classification of childhood NHL which is both clinically and biologically relevant.

**Technical Approach:** Patients less than 21 years of age with tumor tissue or cells available for study who are simultaneously being entered on open, front-end POG treatment protocols for NHL are eligible for this study.

**Progress:** This is a new study. No patients have been entered.
Title: Allogeneic Bone Marrow Transplantation for Acute Lymphoblastic Leukemia in 2nd Hematologic Remission.

Start Date: 27 Mar 84

Principal Investigator: Terry E. Pick, M.D., LTC, MC

Department of Pediatrics

Key Words: Leukemia, lymphoblastic

Objective(s): To study the feasibility of cytosine arabinoside (ara-C), used in high dosage in conjunction with fractionated total body irradiation, followed by allogeneic or syngeneic bone marrow transplantation, in achieving long-term disease-free survival of children with acute lymphoblastic leukemia in second hematologic remission.

Technical Approach: Patients less than 21 years of age with a diagnosis of ALL verified by examination of diagnostic bone marrow, who have suffered their first bone marrow relapse while on therapy with an established POG ALL frontline protocol are eligible. Patients will be in complete remission, without evidence of leukemia either in the bone marrow or extramedullary sites.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been entered on this study.
Title: Evaluation of Response and Further Determination of Toxicity with Aziridinybenzoquinone (AZQ) in Children and Adolescents with Malignant Solid Tumors Resistant to Standard Therapy, Phase II.

Start Date 27 Jan 84

Objective(s): 1) To evaluate the response rate and duration of response to AZQ given to children with recurrent brain and other solid tumors resistant to standard therapy.

2) To further assess the toxicity of AZQ in children.

Technical Approach: Patients under 21 years of age who have recurrent brain tumors with a measurable lesion by CT scan, or other solid tumors (with measurable lesions) resistant to standard methods of therapy, are eligible. Patients must have a life expectancy of greater than six weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been entered on this study.
Objective(s): 1) To determine the response rate and duration of patients aged > 1 year with metastatic (Stage D) neuroblastoma to intensive chemotherapy and fractionated total body irradiation followed by allogeneic or autologous bone marrow transplantation (BMT) performed in first clinical remission.

2) To determine the response rate and duration using the same regimen in patients with Stage D neuroblastoma who fail to respond to, or recur after, conventional chemotherapy.

3) To determine the toxicity of the above regimen.

Technical Approach: This pilot study tests the efficacy and toxicity of high dose melphalan and fractionated total body irradiation supported by allogeneic or autologous BMT for neuroblastoma in first clinical remission or following relapse.

Bone marrow aspiration and therapy will follow the schema outlined in the study protocol.

Progress: Two patients have been entered on the study. One patient has responded extremely well but it is too early to report the status of the other.

Results

Objective(s): 1) To determine the effectiveness of carboplatin (CBCDA) in the treatment of children with brain tumors unresponsive to standard therapy.

2) To further evaluate the toxicities of carboplatin in children.

Technical Approach: All patients ≤21 years of age diagnosed with a recurrent or progressive brain tumor who have slides of the original tumor for neuropathological review will be eligible for entry. The patient must have an estimated survival in excess of two months and a minimum Karnofsky performance score of 30%.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study. No patients have been entered.

Objective(s):
1) To establish the qualitative and quantitative toxicity of this regimen in infants and to determine criteria for dose modification in infants.
2) To obtain an estimate of survival and disease-free survival in infants <12 months of age treated with intensive chemotherapeutic regimen.

Technical Approach: Patients with ALL (or undifferentiated leukemia) <12 months of age at diagnosis are eligible. All patients must comply with immunologic and cytogenetic criteria for diagnosis according to POG front line ALinC classification studies and must be registered on that study as well as this protocol.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study. No patients have been entered.

Objective(s): 1) To test the feasibility of treating children with brain stem gliomas with hyperfractionated (twice daily) radiotherapy.
2) To study the immediate and late side effects of such treatment
3) To test the feasibility of escalation of the dose of radiotherapy in this situation.
4) To monitor the response of the patients in terms of tumor regression, disease free interval, and length of survival.

Technical Approach: Patients $\geq$3 and $\leq$21 years of age with a previously untreated tumor arising in the mesencephalon, pons, including the cerebellar peduncles and floor of the IVth ventricle, and medulla oblongata and with a life expectancy of greater than 6 weeks, shall be eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: No patients have been entered into the study.

**Objective(s):** To estimate the occurrence of subarachnoid seeding in children with well differentiated, IVth ventricular ependymoma following resection and posterior fossa irradiation.

**Technical Approach:** Patients >24 months and <21 years with histologically confirmed primary intracranial ependymomas or ependymoblastoma are eligible.

Therapy will follow the schema outlined in the study protocol.

**Progress:** This is a new study. No patients have been entered.

Objective(s):
1) To evaluate the relationships between environmental exposures and childhood rhabdomyosarcoma (RMS).
2) To evaluate associations between gestational factors and childhood RMS.
3) To evaluate the role of genetic factors in the etiology of childhood RMS.
4) To develop new methods for using subjects from collaborative cancer clinical trials for etiologic research.

Technical Approach: This is a case-control study of childhood RMS which will identify its cases from a large national collaborative clinical trial. The study will reexamine several promising hypotheses suggested by the preliminary study of RMS.

Progress: No entries have been made into this study.
Title: Phase II Study of 6-Mercaptopurine Administered as an Intravenous Infusion for Malignant Solid Tumors and Acute Leukemia

Start Date: 2 Aug 85

Objective(s):
1) To determine response rate of children with advanced malignancy disease for whom no effective anti-cancer therapy is known to treatment with 6-mercaptopurine (6-MP) administered as a 48 hour IV infusion.

2) To further assess the toxicity in a larger group of children.

Technical Approach: Patients must be ≤ 21 years of age with a measurable solid tumor or acute leukemia with either an M3 marrow or extra medullary disease. The diagnosis must be confirmed by appropriate histologic examination.

Progress: This is a new study. No patients have been entered.
