This report, as submitted by the contractor, has been cleared for release to Defense Technical Information Center (DTIC) to comply with regulatory requirements. It has been given no primary distribution other than to DTIC and will be available only through DTIC or other reference services such as the National Technical Information Service (NTIS). The views, opinions, and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy, or decision, unless so designated by other official documentation.
Method of Analysis for the Bradley Fighting Vehicle System

W. L. Shackelford

The Bradley Fighting Vehicle System (BFVS) is part of the U.S. Army's force modernization effort aimed at improving the overall posture of the force. This vehicle has recently come under considerable scrutiny regarding its cost effectiveness. Specifically, there is concern whether the BFVS is performing its originally intended function as a force multiplier.

One source of information that bears on this issue is the performance of the BFVS under realistic combat conditions at the NTC. The NTC provides as close to combat conditions as currently available and battalion task forces are now...

20. Abstract (continued)

routinely rotating to the NTC equipped with the BFVS.

The Army Research Institute, in support of the Combined Arms Training Activity's mission at the NTC, prepared a detailed method of analysis to investigate the BFVS at the NTC. The resultant method of analysis is a comprehensive plan for addressing the issue of the performance of the BFVS at the NTC.

A METHOD OF ANALYSIS FOR THE BRADLEY FIGHTING VEHICLE SYSTEM

INTRODUCTION

The Bradley Fighting Vehicle (BFVS) is part of the U.S. Army's force modernization efforts aimed at improving the overall posture of the force relative to likely foes. The BFVS program has recently been questioned regarding its cost effectiveness. Specifically, there is concern over whether the Bradley is performing its originally intended function as a force multiplier and additional killer on the battlefield. The purpose of the report is to present a method of analysis for the collection of performance data on the BFVS at the NTC and to evaluate its contribution to battalion task force effectiveness as compared to the M113.

BACKGROUND

The National Training Center (NTC), Fort Irwin, California, has been designed as a realistic combat training ground for Army battalion task forces. As part of the normal training experience at the NTC, battalion task forces perform both force-on-force exercises using MILES simulation as well as live-fire exercises. In both types of exercises, scenarios have been developed to be as realistic as possible including employment of a simulated enemy.

Each battalion task force (TF) participates in approximately six force-on-force exercises during a two-week rotation period at the NTC. These exercises usually are more or less evenly divided between offensive and defensive operations using laser-based engagement simulation instrumentation to provide real-time casualty assessment. The simulator, the Multiple Integrated Laser Engagement System (MILES), is used on all principal weapons and casualties are assessed when a weapon fires and the MILES laser hits a target. In addition to force-on-force training, units also perform three missions on the live-fire range during their rotations (see figure 1.)

The scenario dictates the force ratios of the combatants. While terrain and scenario options are limited, no two scenarios are exactly the same. When the TF conducts defensive missions they are always attacked by an OPFOR that replicates a Motorized Rifle Regiment. When TFs conduct offensive operations, they originally encountered a defending Motorized Rifle Company. However, in the summer of 1984, the force ratio was changed to deploy a defending Motorized Rifle Battalion.
Missions Conducted

TF ______ conducted the following missions during their NTC training Period:

Figure 1. Typical Mission Schedule for An NTC Rotation

SCOPE

As indicated above, the BVFS is a critical weapon system for the modern Army. While tests of this system have been previously conducted, its performance in a realistic combat environment has not been determined. The National Training Center (NTC) offers as close to real modern battlefield as is currently available. Further, battalion task forces equipped with the BFVS are beginning to routinely rotate to the NTC for training. As part of this experience, the task forces undergo several mission scenarios using MILES equipment, thus allowing data collection on weapon system performance.

The method of analysis presented in the next section was developed specifically for use at the NTC. As such, it capitalizes on the scenarios and instrumentation currently available there. It also proposes new data collection where gaps between the need to investigate the BFVS and current instrumentation were known. All new data collection was constrained by the known limitations of the resources at the NTC.

The proposed method of analysis should be construed as a comprehensive plan for the utilization of NTC data for the investigation of the BFVS. The plan was prepared to be consistent with the TCATA Test Officer's planning manual (Memorandum 71-1 29 November 1979).
**METHOD OF ANALYSIS**

**OBJECTIVE:** To compare the effectiveness of the M113 [M-2 Cal. 50 MG] (A) and the Bradley Fighting Vehicle (B).

**SUBOBJECTIVES:**
1. To compare the effectiveness of the two systems in Defense Operations
2. To compare the effectiveness of the two systems in Defense Operations
3. To compare the effectiveness of the two systems in Live Fire Defense Operations
4. To compare the effectiveness of the two systems in Night Operations

**COMPONENT ATTRIBUTES:**

| 1.1 | What is the comparable effectiveness of the two systems in the defense in sector |
| 1.2 | What is the comparable effectiveness of the two systems in the defense from a BP |
| 1.3 | What is the comparable effectiveness of the two systems in the delay |
| 1.4 | What is the comparable effectiveness of the two systems in the defense counterattack |
| 1.5 | What is the comparable counter reconnaissance effectiveness of the two systems in defense operations |

| 1.2.1 | What is the comparable effectiveness of the two systems in the movement to contact |
| 1.2.2 | What is the comparable effectiveness of the two systems in the hasty attack |
| 1.2.3 | What is the comparable effectiveness of the two systems in the deliberate attack |

| 1.3.1 | What is the comparable effectiveness of the two systems in the live fire defense from a BP (day) |
| 1.3.2 | What is the comparable effectiveness of the two systems in the live fire defense from a BP (night) |

| 1.4.1 | What is the comparable effectiveness of the two systems in the night attack |
| 1.4.2 | What is the comparable effectiveness of the two systems in the night defense |

**COMPONENT SUB-ATTRIBUTES:**

| 1.1.1.1 | What is the comparable effectiveness of A & B to kill tanks |
| 1.1.1.2 | What is the comparable effectiveness of A & B to kill BMP's, MLTB's, 2SU-23/4, BRDM's, 122 SP's |
| 1.1.1.3 | What is the comparable effectiveness of A & B destructive fire power by range |
| 1.1.1.4 | What is the comparable effectiveness of A & B when disengaging |
| 1.1.1.5 | What is the comparable effectiveness of A & B in covering obstacles by fire |
| 1.1.1.6 | What is the comparable effectiveness of A & B in slowing the enemy attack |
| 1.1.1.7 | What is the comparable effectiveness of A & B under obscured conditions |
| 1.1.1.8 | What is the comparable effectiveness of A & B under MOPP 4 NBC defense conditions |

**DATA SOURCES**

- OPORDs, FRAGO, Overlays, Graphics, Commander's Guidance
- Initialization Lists, RDMs
- Tape, CIS Tape, AAR Charts
- THP's, Live Fire Printouts, Scenarios

### Method of Analysis

1. **1.2.2.1.** What is the distance that A & B bound under overwatch
2. **1.2.2.2.** What is the direct fire effectiveness of A & B bounding element when in initial enemy contact
3. **1.2.2.3.** What is the overwatch direct fire effectiveness of A & B when the bounding element is in initial enemy contact
4. **1.2.2.4.** What is the comparable effectiveness of A & B base of fire element
5. **1.2.2.5.** What is the comparable effectiveness of A & B assault element
6. **1.2.2.6.** What is the comparable effectiveness of A & B in protecting assaulting tanks from enemy fire
7. **1.2.2.7.** What is the comparable Effectiveness of A & B in overwatching obstacle clearing operations
8. **1.2.2.8.** What is the difference in time from LD to seizure of the objective by A & B forces
9. **1.2.2.9.** What is the difference in momentum of the main effort when supported by a supporting attack or base of fire consisting of A & B systems
10. **1.2.2.10.** What is the difference in tanks allocated to the main effort when the supporting attack or base of fire consists of A & B forces

### Data Sources

1. **1.3.1.1.** What is the comparable effectiveness of A & B to kill BMP, MTLB, ZSU-23/4, BRDM, 122 SP
2. **1.3.1.2.** What is the comparable effectiveness of A & B to kill tanks
3. **1.3.1.3.** What is the comparable difference of A & B equipped task forces to attrit the enemy
4. **1.3.1.4.** What is the comparable direct fire destruction contribution against armored targets by A & B
5. **1.3.1.5.** What is the comparable effectiveness of A & B when defending under obscured conditions
6. **1.3.1.6.** What is the comparable effectiveness of A & B when defending under MOPP & NBC defense conditions
