AIR FORCE HUMAN RESOURCES LABORATORY
R&D ACCOMPLISHMENTS AND SERVICES FY86 - FY88

February 1989
Final Technical Paper for Period October 1985 - September 1988

Approved for public release; distribution is unlimited.

AIR FORCE SYSTEMS COMMAND
BROOKS AIR FORCE BASE, TEXAS 78235-5601
This document provides a brief description of research and development (R&D) accomplishments of the Air Force Human Resources Laboratory and services provided to various customers from fiscal years 1986 to 1988. Some of these accomplishments resulted in interim products and/or capability/feasibility demonstrations which served as building blocks for developing the end products.
This document provides a brief description of research and development (R&D) accomplishments of the Air Force Human Resources Laboratory and services provided to various customers from fiscal years 1986 to 1988. Some of these accomplishments resulted in interim products and/or capability/feasibility demonstrations which served as building blocks for developing the end products. Descriptions of these accomplishments are grouped according to the primary user or organization which generated the R&D requirement. This grouping is rudimentary in that it does not account for the multiple users of the R&D products and services. Appendix A provides an index that relates all products/services to their respective user organizations.

vii
Combat Maintenance Capability Methodology. This was an initial comprehensive effort to analyze the effect of predicted combat on maintenance while considering the simultaneous impacts of intense flying schedules, increased demands on maintenance, airbase attacks, aircraft attrition and battle damage, and other combat conditions. A scenario was developed, for Hahn AB, Germany, to describe wing operations in wartime. Three modeling techniques (TSAR, TSARINA, and DynaMETRIC) were selected to provide optimal determination of logistics composites, theater airbase resources, and supply demands for wartime operations. This effort provided methodologies to analyze the differences between peacetime and combat aircraft maintenance and the effects of these differences on sortie generation capability. The methodologies developed can be used to better identify training requirements for combat tasks and to realistically assess the potential bottlenecks to sortie generation under combat conditions. The combined results of this effort provide methodologies to realistically assess generation of wartime sorties, identify shortfalls and problem areas, and evaluate possible corrective measures using computer simulation models. (FY86)

CUSTOMERS: HQ USAF/XOOR, HQ USAF/LE-RD

POINT OF CONTACT: Mr. Richard Weimer, AFHRL/LRC, (513) 255-2606, AUTOVON 785-2606

Logistics Command and Control Exercise Program. A demonstration training program was developed to instruct United States Air Forces in Europe (USAFE) personnel on basic logistics operations within the European Theater. It provided an overview of the USAFE and North Atlantic Treaty Organization (NATO) concepts so that personnel would have a better appreciation of the importance of their jobs within the Theater. (FY86)

CUSTOMER: HQ USAF/LGX

POINT OF CONTACT: Mr. Michael Young, AFHRL/LRG, (513) 255-8229, AUTOVON 785-8229

Conference: Validity for 1990s and Beyond. The AFHRL Manpower and Personnel Division, with the support of the Educational Testing Service, sponsored a 3-day conference on test validity and models for validity as extended into the next decade. Distinguished academicians and practitioners presented both theoretical and applied papers. In addition, to demonstrate a point of law as it pertains to selection and classification tests, an actual Federal judge presided over a mock trial patterned after a seminal case involving the County of Los Angeles and Los Angeles firefighters. A hard-cover bound book of the papers and comments on the papers was published by LEA Publishers, Inc. (FY86)

CUSTOMERS: USAF/DPXOA, OASD (FMIMP), HQ USMEPCOM

POINT OF CONTACT: Dr. Malcolm Ree, AFHRL/MAA, (512) 536-3256, AUTOVON 240-3256

Air Force Officer Qualifying Test (AFOQT) Forms P1 and P2. Two new parallel versions of the AFOQT (P1 and P2) were developed to replace the operational AFOQT, Form 0. New forms of the AFOQT are developed periodically to refine the instrument, and to limit possible test compromise. The AFOQT is composed of 16 subtests used to score five composites measuring cognitive abilities deemed relevant to officer success. It is the primary source of aptitude information used to qualify civilian applicants for officer pre-commissioning training through
the Reserve Officer Training Corps (ROTC) and the Officer Training School (OTS). AFQT results are also used, along with other criteria, in the classification of aircrew members as pilots or navigators. Additional products developed as companion documents to accompany the test booklets were administration manuals, scoring keys, tables for converting examinees' raw scores to percentile equivalents on selection and classification composites, and a test information pamphlet for examinees. (FY87)

CUSTOMERS: HQ USAF/DPXOA, AFHRC/DPMY, ATC/TT

POINT OF CONTACT: Ms. Jacobina Skinner, AFHRL/MOAO, (512) 536-3942, AUTOVON 240-3942

Non-Line Officer Projection Model. The Non-Line Officer Projection Model simulates the personnel activity for each non-line competitive category (e.g., Medical Corps, Judge Advocate General, Chaplain), produces displays of the personnel activities, and projects the non-line officer force structure for at least 10 years into the future. The model includes promotions, augmentations, separations, reduction-in-force board actions, and selective early retirement board actions. A user-friendly routine allows the user to add, delete, and edit data easily and choose among report options. The model is written in SIMSCRIPT II.5 and runs on both mainframe and personal computers. This model is being used by Air Staff and non-line corps manpower and personnel decision makers and planners to evaluate the impact of policy decisions and promotion plans for each non-line officer category. The model was used to help establish the promotion rates for the August 1987 Colonels Promotion Board. (FY87)

CUSTOMERS: HQ USAF/DPXOA, HQ USAF/DPXO

POINT OF CONTACT: Maj Timothy Bergquist, AFHRL/MOM, (512) 536-3677, AUTOVON 240-3677

Logistics Managerial Promotion System. Statistical and data processing support was provided during the development of a logistics managerial promotion appraisal system for Air Force civilians. The project was conducted by the Air Force Civilian Personnel Management Center, in behalf of HQ USAF/DPC, with all computer analyses performed by the AFHRL Information Sciences Division. (FY87)

CUSTOMERS: HQ USAF/DPC, AFCPMC/DPCR

POINT OF CONTACT: Ms. Doris Black, AFHRL/SCA, (512) 536-3921, AUTOVON 240-3921

Logistics and Human Factors/Training Analysis of Future Gunships. This effort developed and demonstrated methodology to quantify the sortie generation capability and maintenance manpower requirements for a hypothetical but representative state-of-the-art gunship. This work demonstrated for the first time that quantitatively oriented front-end logistics analyses during a system's conceptual design phase can reduce weapon system life-cycle costs and increase supportability, improving overall war-fighting capability. Emphasis was on quantification of selected resources for a specific weapon system design and specified missions and scenarios. The intent was to provide a baseline comparison system and to accumulate preliminary data for a replacement gunship. Findings from these efforts have been incorporated into the Requests for Proposals (RFPs). (FY87)

CUSTOMERS: HQ USAF/XDD, HQ USAF/RDQ, ASD

POINT OF CONTACT: Capt Douglas Popken, AFHRL/LRL, (513) 255-8418, AUTOVON 785-8418
Small Unit Maintenance Manpower Analyses (SUMMA). The SUMMA program developed technology that provides a computer-based decision support system (computer model) useful for: projecting and analyzing combat workloads based on deployment scenarios; allocating maintenance tasks to new or redefined job specialties; evaluating, through integration of logistics performance simulation and force management/policy analysis, the combat effectiveness and feasibility of desired job restructuring. The SUMMA decision support system can be used by analysts working in system program offices to help in the definition and redefinition of maintenance occupations for new weapon systems. For managers in the manpower, personnel, and training arenas, SUMMA allows a more complete analysis of proposed changes in occupational structures and the capability to judge the probable contribution of restructured maintenance specialties to combat success. (FY87)

CUSTOMERS: HQ USAF/LE, ASD, TAC, SAC, MAC

POINT OF CONTACT: Mr. Edward Boyle, AFHRL/LRL, (513) 255-8418, AUTOVON 785-8418

Multi-Test Appropriateness Indices. Multi-test appropriateness indices can be used to detect individuals inadequately or inappropriately measured by the Armed Services Vocational Aptitude Battery (ASVAB). Cheating to obtain higher scores or malingering (e.g., purposely getting low scores under a nationwide mobilization) are important instances of inappropriate test responses. Implementation of these indices (in place of an established measure of deliberate failure) is being considered at HQ USAF/DPX. (Exploratory work completed FY87)

CUSTOMERS: HQ USAF/DPXOA, OASD (FMJMP), HQ USMEPCOM, CNO, HQ USA, HQ USMC

POINT OF CONTACT: Mr. James Earles, AFHRL/MOAE, (512) 536-3256, AUTOVON 240-3256

ASVAB Forms 15, 16, 17. The ASVAB is used as the primary enlisted selection and classification test for the United States Armed Services. AFRL is the lead organization for conducting the R&D necessary to support joint-Service and Department of Defense (DOD) programs. Raw scores on ASVAB Forms 15, 16, and 17 were converted to standard scores for all the Services' selection and classification composites. These conversions are being evaluated using operational scores from applicants. (Completed in FY87, implemented in FY88)

CUSTOMERS: HQ USAF/DPXOA, USMEPCOM

POINT OF CONTACT: Dr. Linda Curran, AFHRL/MOAE, (512) 536-3256, AUTOVON 240-3256

ASVAB Forms 18, 19. ASVAB tests were constructed for use in high schools as part of the DOD Student Testing Program. Raw scores on these forms were converted to the score metric used by school counselors and also to the operational scores used by each Service for selection and classification. (Completed FY88)

CUSTOMERS: HQ USAF/DPXOA, USMEPCOM

POINT OF CONTACT: Mr. James Earles, AFHRL/MOAE, (512) 536-3256, AUTOVON 240-3256

High School Equity: Item Level Approaches. The eight nonspeeded subtests of the ASVAB used in the DOD Student Testing Program were examined for differential item functioning. Twenty-seven different indices were calculated for each of the 200 items on the eight subtests for comparisons
of item functioning for White and Black examinees, White and Hispanic examinees, and male and female examinees. Relatively few items were consistently identified as functioning differently for any of the comparison groups. (Completed first study FY88)

CUSTOMERS: HQ USAF/DPXOA, USMEPCOM

POINT OF CONTACT: Dr. Linda Curran, AFHRL/MOAE, (512) 536-3256, AUTOVON 240-3256

ASVAB Civilian Occupational Validation. The ASVAB is used in over 14,000 high schools each year and 1.3 million high school students are tested annually throughout the nation as part of the DOD Student Testing Program. High school counselors and students use ASVAB scores for career exploration and the joint-Service recruiters use the ASVAB scores as "leads" for potential applicants for their respective Services. In order to make the ASVAB as useful to counselors and students as possible, the relationship between scores on the ASVAB and success in civilian occupations has to be demonstrated. Until recently, however, validity data on the ASVAB have derived primarily from military training success criteria. To provide validity data appropriate for the high school testing program, a preliminary ASVAB civilian validation study was conducted using "holding a job in one of 12 occupations for at least 3 months" as the criterion. A follow-on study using job performance criteria is planned. (First study completed FY88; second effort is underway)

CUSTOMERS: HQ USAF/DPXOA, HQ ATC, ATC/RS, AFMPC, OASD (FM&MP) (MM&P) (AP)

Ultimate users will be counselors in the high schools throughout the United States

POINT OF CONTACT: Dr. Thomas Watson, AFHRL/MOAE, (512) 536-3256, AUTOVON 240-3256

Armed Forces Qualification Test (AFQT). The Office of the Assistant Secretary of Defense (OASD) (FM&MP) requested a new test composite to replace the AFQT. Through the use of regression analyses and cross-tabulations, a new AFQT composite was developed and accepted by the OASD for use in all American military qualification testing. (FY88)

CUSTOMERS: USAF/DPXOA, OASD (FM&MP), HQ USMEPCOM, CNO, HQ USA, HQ USMC

POINT OF CONTACT: Dr. Malcolm Ree, AFHRL/MOAE, (512) 536-3256, AUTOVON 240-3256

Math Techniques for Symmetric Regressions Smoothed Test Equatings. Past equatings of new ASVAB forms have always been unidirectional; i.e., from the new forms to the reference form. Mathematical procedures have been applied to make resultant equatings symmetric, such that the equating is indifferent to whether the new forms are equated to the reference or vice-versa. (FY88)

CUSTOMERS: HQ USAF/DPXOA, USMEPCOM

POINT OF CONTACT: Mr. James Earles, AFHRL/MOAE, (512) 536-3256, AUTOVON 240-3256

Accession/Retention Model. AFHRL accession/retention R&D has encompassed three different efforts to gain insight into the impact of economic factors in this area. The results of an analysis of the retention of airmen in various Air Force specialties were used to develop the Air Force Reenlistment Analysis Package (AFRAP). AFRAP allows changes to be made in bonuses, relative
wages, and demographic factors, and predicts the effects these changes would have on the retention of airmen. The other two personnel market studies were the Joint Accession/Retention Study, which looked at how accession and retention are jointly determined, and the Civilian Availability Study, which estimated the number and skills of civilians needed by the Air Force. (FY88)

CUSTOMERS: HQ USAF/DPXA, OASD(FM&MP)

POINT OF CONTACT: Mr. Larry T. Looper, AFHRL/MOMD, (512) 536-3942, AUTOVON 240-3942

Personnel Data Bases for HQ USAF/DP and RAND Corporation. Annual updates were provided from several historical enlisted personnel data bases to the Directorate of Personnel Plans, Analysis Division (HQ USAF/DPXA) to support their work with the RAND Corporation on the Enlisted Force Management Project. Master file data were derived from the Processing and Classification of Enlisted file, the Airman Reenlistment and Loss file, and an automated file of data elements and code definitions for the time period. (FY88)

CUSTOMERS: HQ USAF/DPXA, HQ AFMPC/DPMDW, RAND Corporation

POINT OF CONTACT: Mr. Jim Brazel, AFHRL/SCYJ, (512) 536-2146, AUTOVON 240-2146

Enlisted Force Accession and Attrition Analysis. Annual reports on enlisted personnel were provided to HQ USAF/DPXA. These reports contained data on all individuals who enlisted in the Air Force during the previous 10 years, and reflected losses, re-enlistments and extensions during that time. Eight demographic variables were used as a means of tracking enlisted retention by cohort year group. The reports related enlisted retention (re-enlistment and extension) to planned personnel program objectives and analyzed the retention of cohort year groups on the basis of these demographic attributes. (FY88)

CUSTOMER: HQ USAF/DPXA

POINT OF CONTACT: Mr. Dick Rogers, AFHRL/SCY, (512) 536-3928, AUTOVON 240-3928

Historical Data Base of Officer Personnel. A data base containing information on Air Force officers on active duty at any time from 1960-1987 was constructed from R&D master files maintained by the AFHRL Information Sciences Division. The data base is organized to facilitate the study of trends within the officer force and the impact of a variety of personnel program initiatives. The data base supports analyses conducted at HQ USAF/DPXA. A file of identity and name changes and a file containing meanings of data codes accompanied the officer data base. Data on 430,000 officers are included in the data base. (FY88)

CUSTOMER: HQ USAF/DPXA

POINT OF CONTACT: Mr. Dick Rogers, AFHRL/SCY, (512) 536-3928, AUTOVON 240-3928

Study of Officer Test Performance by Race. This project provided demographic data and descriptive statistics of Air Force Officer Qualifying Test (AFOQT) performance for ethnic subgroups composed of Caucasian, Black, and Hispanic subjects. Sample groups included (a) all AFOQT examinees (1 Jan 83 - 31 Dec 86), (b) all who submitted an application, and (c) all
applicants who were selected. The average percentage of applicants selected was 48%, with some variations among ethnic groups. (FY88)

CUSTOMER: HQ USAF/DPPE

POINT OF CONTACT: Ms. Linda Elliott, AFHRL/MDAO, (512) 536-3942, AUTOVON 240-3942
Attrition Trends and Technical Training. Quarterly and annual reports on graduation/elimination rates were produced from data on Air Force enlisted technical training courses. The reports were supplemented with aptitude and demographic data broken down by race, sex, education, mental category, and enlistment category. The reports were provided in conjunction with a Memorandum of Agreement with the Air Force Military Personnel Center. (FY86-continuing)

CUSTOMERS: AFMPC/DPMR, HQ ATC/TTPR, HQ ATC/TTOK

POINT OF CONTACT: Ms. Doris Black, AFHRL/SCA, (512) 536-3921, AUTOVON 240-3921

Reevaluation of the Weighted Airman Promotion System (WAPS). The basic research methodology used in the development of WAPS is known as "policy capturing." It consists of mathematically duplicating or capturing the rankings assigned to a sample of airmen by members of an experimental promotion policy board. Since the promotion policy of experts may change significantly over time, it is necessary to periodically reevaluate the model to ensure that WAPS is consistent with current Air Force management policies while remaining both visible and equitable. Candidate promotion systems were developed that show the direction of change indicated by the expert raters. The impact of these systems on women and minorities was determined. The results of this R&D have provided Air Force enlisted promotion policymakers with a current, scientifically defensible basis for making improvements to WAPS. This, in turn, will ensure that the best and most deserving enlisted personnel are selected for promotion to the important mid-level grades and will impact positively on retention rates, quality of performance, and morale. (FY86)

CUSTOMERS: AFMPC/DPMA, HQ USAF/DPXO

POINT OF CONTACT: Mr. Walter Albert, AFHRL/MODM, (512) 536-3677, AUTOVON 240-3677

Health Professions Scholarship Program (HPSP) Model. An increase in the ratio of applicants per scholarship from one to three provided a reason to assess the selection procedures used in awarding HPSP scholarships. A preliminary investigation revealed that cutoff scores for scholarships tended to rise during the selection process. To help maintain a constant cutoff score, a selection model was developed using the policy-specifying methodology. The model provides a check to ensure that cutoff scores remain constant, and by including variables that the selection board does not formally address, it gives alternative scores which can be rank ordered. The rankings can be used to screen applicants to meet the selection board, to flag applications that the board might need to review again, to serve as a tie breaker, or to function as an additional board member. The model's score forms the basis for a longitudinal data base to track the progress of scholarship recipients through training and through their Air Force careers. The selection model is being used to assist AFMPC/SG in AFHPSP selection procedures. (FY86)

CUSTOMER: AFMPC/SGY

POINT OF CONTACT: Lt John McGarrity, AFHRL/MOMD, (512) 536-3942, AUTOVON 240-3942
English Language Tests for Foreign Nationals. Basic and intermediate versions of the English Language Tests (ELTs) have been used since 1965 to assess the proficiency of foreign nationals applying for employment at overseas bases. The ELTs were revised to update the content and to refine the tests' value for identifying job applicants with a marginal or superior command of English as a second language. Four language components were assessed: listening, reading, speaking, and writing. Parallel forms of both the basic and intermediate-level tests were constructed and validated. The ELTs were field tested with foreign nationals employed at Howard AFB, Panama. Their scores were shown to correlate significantly with supervisory ratings of ability to use English on the job. The revised ELTs are now being used operationally by civilian personnel offices at overseas locations. (FY87)

Information Pamphlet for the Air Force Officer Qualifying Test (AFOQT). Individuals interested in applying for commissioning programs are required, as part of the officer selection process, to take the AFOQT and demonstrate proficiency in aptitude, knowledge, and ability areas required for officer jobs. A pamphlet was developed to familiarize prospective test-takers with the nature and purpose of the test. Information pertinent to test format, schedule, and content, including sample questions and answers, was provided. Recruiters and test examiners maintain a supply of the pamphlets and provide a copy to each of the approximately 35,000 applicants scheduled for testing annually. (FY87)

Decision Models. This stream of research has resulted in several quantitative tools to aid Air Force manpower and personnel decision makers. Much of the work has been performed in response to needs identified by the using personnel community. Recent examples of this are the career flow model of the non-line officer force, the decision modeling work to support the selection of the best candidates to receive health professions scholarships, and the enhancement of the Laboratory's decision modeling capability. This research most often entails application to personnel problems, but it has also resulted in the development of new techniques in mathematical optimization, simulation, and decision analysis. R&D in decision analysis has supported work in enlisted promotion, person-job match, and weapon system effectiveness. Finally, it has resulted in the development of an Integrated Decision Modeling System software package that incorporates four widely used decision analysis tools into one system to assist the user in the selection and application of the proper decision analysis technique. (FY87)

Retraining Person-Job Match (PJM). At various times, the Air Force will have more personnel than needed in some Air Force specialties (AFSS) and fewer personnel than needed in others. In order to balance AFSSs, AFMC must identify which personnel should be reclassified and retrained. The number of individuals that can be reclassified is usually much greater than the number of positions available. The Air Force addresses this problem by allowing personnel to volunteer for
retraining and reclassification. If the number of volunteers is too small, the Air Force identifies personnel who must retrain to specific AFSs. The present system classifies personnel on a "first-come, first-served" basis. Although automated, the present system does not take advantage of available classification technology to optimally select and reclassify personnel. AFHRL is developing two models to assist AFMPC in the selection and reclassification of personnel. The first model addresses the nonvolunteer retrainee. In the nonvolunteer model, once the personnel to be considered for reclassification have been identified (along with their AFSs) and the number of required retrainees has been determined, the model uses mathematical programming techniques to optimally assign personnel to retraining AFSs. The assignment is based on a predefined payoff algorithm which defines a person's "value" in terms of possible retraining AFSs. The nonvolunteer model has been completed and implemented by AFMPC. The volunteer model is currently being developed. (FY88)

ASCII CODAP. The Comprehensive Occupational Data Analysis Programs (CODAP) is the principal occupational data analysis software system used by the Air Force. The CODAP ASCII system consists of a package of computer programs used to input, process, organize, and report occupational data from job inventories. The current AFHRL package has the capability of processing 20,000 cases, 3,000 task ratings per case, and 2,000 items of background information. Hierarchical clustering can be performed on up to 7,000 cases. Current work is concentrating on adding advanced task and job clustering capabilities and other research technologies called for by AFRL Manpower, Personnel, and Training (MPT) integration R&D. New capabilities include enhancements to existing programs and expanded capabilities in the areas of profile analysis, multidimensional scaling, regression analysis, and factor analysis. The other branches of the US military services, as well as the British, Canadian, West German, and Australian Armed Forces, have incorporated CODAP into their operational occupational measurement programs. Officer Training School (OTS) Graduate versus Nonmedical Eliminee Profiles. USAF Recruiting Service requested descriptive profiles for OTS graduates, nonmedical eliminees, and self-initiated eliminees. Data regarding applicant characteristics were collected for each group. Characteristics included: measures of academic ability (type of degree--BS/BA/MS/MA/PhD, grade point average, completion of calculus courses, and Air Force Officer Qualifying Test (AFOQT) scores); indicators of general suitability (recruiter evaluations, letters of recommendation); occupational specialty; and demographic information (race, sex, age, prior military service). Graduates tended to have higher AFOQT scores and higher grade point averages than did nonmedical eliminees. The profiles of graduates and self-initiated eliminees did not differ. The profile analysis indicates that recruiters should consider, in addition to indicators of academic ability, other applicant characteristics, such as value orientation, motivation, and expectations, in order to reduce the number of self-initiated eliminees. (FY86)

Orbital Mechanics Tutor. This system was developed to provide an environment for students to discover principles of ground traces as a direct function of the orbital elements. The system was designed to teach students how to "deduce" a satellite's orbital elements by looking at a graphic display of a satellite's ground trace. The system also teaches students how to use more systematic behaviors to explore this domain. Since the system is equipped with a number of on-line tools that were specially designed to help students better understand facts, principles, and relationships, the student is free to investigate different options and learn at his/her own pace. If, however, the student fails to make satisfactory progress, then the system intervenes and directs the student toward specific goals. (FY87)

Procurement Management Information System (PROMIS) Enhancements. Since 1986, AFHRL has made significant advances in applying person-job-match (PJM) technology to the job classification area. Through PROMIS, managed by the Air Force Recruiting Service, all enlistees are classified into either a specific Air Force specialty or one of four general job areas (mechanical, administrative, general, or electronics). Enhancements to the PROMIS PJM algorithm include: (a) the addition of Vocational Interests for Career Enhancement (VCICE) scores, thus providing more data on the recruit's job preferences; and (b) the use of all 10 ASVAB subtest scores as predictors of technical school success, a surrogate measure for job performance. Both enhancements are awaiting approval for operational implementation. (FY88)

Validation of the Air Force Officer Training School (OTS) and Reserve Officer Training Corps (ROTC) Selection Systems. The selection systems for OTS and ROTC candidates were examined. Selection into ROTC is based on an overall Quality Index Score (QIS), based on a weighted combination of five measures of academic ability and a rating of overall acceptability provided by the detachment commander. Selection into OTS is based on minimum qualifications and overall assessment by OTS selection boards, who are advised to consider applicant characteristics such as academic ability, leadership potential, and overall suitability for a military officer role. Applicant characteristics most highly related to OTS selection were identified and examined for relation to eight measures of performance in training and on the job. ROTC QIS scores were validated using the same eight criteria. Experimental performance appraisal forms were developed and administered to the supervisors of 3,000 OTS and ROTC graduates. Supervising officers were informed that the appraisal forms were for research purposes only, in order to facilitate a more critical appraisal. Subjects were rated on specific abilities, overall job performance, motivation, and potential for career progression. (FY88)

The overall objective of this effort was to develop a prototype Intelligent Tutoring System (ITS) in the domain of Orbital Dynamics. The prototype is executable on a Xerox 1108/1186 workstation. Five detailed objectives for the Phase I effort were: (a) determine the academic characteristics that make a training domain suitable for ITS applications; (b) develop an intelligent and powerful human-computer interface; (c) develop a model of domain expertise for the prototype; (d) develop an effective tutorial module to guide individualized training processes; and (e) develop a demonstrable ITS prototype in the field of Orbital Dynamics as taught by the United States Air Force Academy (USAFA). The prototype teaches about 25 hours of the curriculum for Block I of Orbital Mechanics. A second-generation system, currently in the planning stage, will extend the system to teach the entire Block I Orbital Dynamics curriculum and add authoring tools to allow ITS development by on-site training development personnel. (FY88)

Ground-Launched Cruise Missile (GLCM) Redesign. A demonstration of the value of on-line reliability and maintainability analysis using computer-aided design (CAD) was achieved through redesign of the turbine power generator (MEP-404B) on the GLCM Unique Turbine System (GUTS). Field-reported Mean Time Between Failure (MTBF) was less than 25 hours, due, in part, to the buildup of excess heat. Availability of the weapon system was further reduced due to maintainability problems for this generator. To address these problems, the GLCM Program Office redesigned the MEP-404. The AFHRL Logistics and Human Factors Division (AFHRL/LR) joined this redesign effort through the use of CAD to ensure that the repackaging of the GUTS allowed required ventilation (to improve reliability) and that all major components could be easily accessed (to improve maintainability). Twenty-one (21) of AFHRL's 28 design recommendations were accepted and incorporated into the hardware. These recommendations increased the estimated availability of the turbine systems by 4% to 8%, and improved estimated repair elapsed times by 25% to 50%. (FY86)

Analysis of Flight Simulator Transport Delay Effects. As aircraft simulators become increasingly complex and expensive, their ability to provide realistic training becomes an ever-growing concern. Simulators for the tactical fighter have been plagued by the inability of the simulation to faithfully reproduce in real time the fighter aircraft's response to pilot input. This analysis investigated transport delay effects to determine the maximum acceptable time delay with respect to flying qualities. Experiments were conducted with the NT-33 (a modified T-33) with analog and digital computers on board that simulated various aircraft/mission combinations. Tentative results indicated that 150 milliseconds is the maximum transport delay that can be tolerated, with a simulator-added delay of less than 50 milliseconds. These data apply to small-field-of-view simulators. A follow-on study is planned which will incorporate an expanded field of view. (FY87)

Instructor-Operator Station (IOS) Design Guidelines. The initial effort under this task was a review of current research and field experience to assess the utility of existing instructional features for conversion and continuation training as taught by each of the operational commands, MAC, SAC, TAC, and ATC. Navy and Army data were added as applicable. This compilation of data was reduced and organized in a matrix of instructional features by applications, with command differences noted to allow designers to select the most appropriate features for each operational simulator. A portion of this effort was the derivation of a standard engineering definition for each instructional feature. A concurrent effort is the development of a guide for the design of IOSs for simulators. This guide was written to define the general characteristics of IOS layouts for both single and multiple instructor configurations. Guidance for the standardization of the format for cathode-ray tube (CRT) pages and the form of the data on the pages was included to the greatest extent practical. The guide established a standard keyboard logic and standard display formats. The overall goal of these first two efforts was a design guidance package, just short of a specification, to create a more standard set of instructional capabilities and make the instructor's environment more effective. This goal has been achieved through the publication of surveys and guidelines. Work is underway to incorporate these guides into Military/Prime Specifications. (FY87)

Effects of Chemical Warfare Defense (CWD) on Airbase Maintenance Operations. Systematic observations, data collection, and videotape measurement techniques were developed to assess the task performance of aircraft maintenance technicians wearing the chemical defense ensemble. These techniques were first tested at Shaw AFB, NC, then used for actual data collection at Hahn AB, Germany. At Hahn AB, data were collected on the performance of technicians wearing the ensemble while performing 26 representative maintenance tasks. These data were analyzed to assess the impact of the ensemble on performance. In addition, these data were used to identify: tasks that are difficult to perform; specialized techniques and "workarounds"; potential improvements to the ensemble; and potential equipment design modifications which could facilitate maintenance performed under both normal and chemical warfare conditions. A second data collection effort at Hahn AB was accomplished to evaluate techniques developed to overcome observed problems found during the first study. (FY87)

Mission Reliability Model (MIREM). The MIREM is a program to evaluate the reliability and sustained operating capability of advanced fault-tolerant electronic circuits during early development. MIREM provides engineers with a tool which can evaluate alternative avionics designs and identify improvements that can be made during the conceptual phase of development. MIREM is applicable to modular avionics systems that process many functions at once, require a minimum number of resources, and operate for extended periods of time without a critical failure. This is accomplished by incorporating fault tolerance—the ability to endure component failures without a loss in capability. MIREM assists the engineer by quantifying the fault tolerance in a circuit. Now that development of the MIREM software is complete, the model is being incorporated into MIL-STD 756B as a standard reliability prediction technique. (FY87)

Guidelines for Range System Development. A series of experiments examined the effects of factors such as real-time and post-mission feedback on the effectiveness of electronic combat (EC) training systems. The basic findings from these experiments were: (a) Simple emitter systems which provide neither realistic, real-time feedback nor significant post-mission feedback cannot support effective countermeasures training; (b) providing accurate post-mission feedback can compensate to a great degree for lack of real-time interaction, but the lack of such interaction may affect the types and timing of countermeasures employed; (c) significant degradation in EC performance occurs over a 4- to 6-month period, with the amount of loss being affected by the level of prior proficiency and the amount of prior training; and (d) significant transfer of training from the flight simulator to the aircraft occurs, as evidenced by more frequent use of countermeasures on early exercise sorties and a reduction in judged attrition. These results provide some guidelines for the development of future range systems. In addition, they serve as a starting point for an investigation into the integration of a spectrum of training devices to produce an optimal EC training program. (FY88)

Precursor Computer-Aided Acquisition and Logistics Support (PCALS) Demonstration. Two prototype information software systems, developed under independent Air Force efforts, were integrated for a PCALS demonstration sponsored by the Office of the Secretary of Defense. One system, developed as a joint project between AFHRL and the Air Force Wright Aeronautical Laboratories (AFWAL) Flight Dynamics Laboratory, is the Integrated Design Support (IDS) System. IDS is an information system which manages weapon system technical data primarily in the engineering and logistics environments. The second system, developed in the AFWAL Materials Laboratory, is called the Integrated Information Support System (IISS). The IISS also manages weapon system technical data, but primarily in a manufacturing environment. Under a three-schema architecture, both systems employ a neutral view or conceptual schema to interface between the user's view of the data, or external schema, and the way the data are physically stored, or internal schema. Under the PCALS effort, the conceptual schemata from these two software systems were integrated to demonstrate that two independently developed information systems built using the three-schema architecture can be successfully integrated. The success of the integration effort was
demonstrated by posing live queries to the system within the framework of a realistic scenario. This effort provided a preliminary demonstration of the overall Computer-Aided Acquisition and Logistics Support (CALS) information transfer capability. (FY88)

Content Data Model (CDM). The CDM is an attempt to provide structure to the rapidly developing world of digital data bases and electronic information systems. A single cohesive model is used to describe all types of information that could be required to maintain any given vehicle. Important goals include: providing an interchange and validation structure for any information which may be passed between automatic systems that operate on different software or hardware; providing a generic model for any future information or vehicles which might be included in an electronic system; and allowing repetitive or shared data to be stored only once in any electronic storage system. The technology intent is to make the information independent of the implementation. The CDM is being coordinated with the DOD CALS Working Group, and is expected to become a CALS standard. (FY88)

Product Data Control Model (PDCM). Integrated Design Support (IDS) is an information systems R&D program which has as its primary objective improvement of the management of the technical data associated with major Air Force weapon systems. The PDCM is the IDS information model or conceptual schema and is the cornerstone upon which IDS is being built. The PDCM defines all the data entities and their logical interrelationships needed to provide weapon system engineering support. The PDCM provides the framework for data integration by defining how the enterprise-wide engineering, manufacturing, and operations support products relate from the viewpoint of critical data. Specifically, the PDCM serves as a bridge between the user and the hardware system, freeing the user from needing to know where or how the particular data one wishes to access are stored. The PDCM is unique to industry and has currently been acknowledged as one of the first models of its kind that allows one to capture, manage, maintain, and retrieve all the technical data pertaining to a product. This advanced data base management system technology representation has been highly acclaimed by the engineering community for its neutral and logical view, and is actively being studied for implementation within the Air Force Air Logistics Centers (ALCs), the National Aeronautics and Space Administration (NASA), the US Department of Transportation, and various aerospace organizations including Boeing, Martin-Marrietta, General Dynamics, Rockwell, and Lockheed. It is also playing a significant role in national product data standards development. (FY88)

Authoring and Presentation System (APS). The APS was developed in support of the Integrated Maintenance Information System (IMIS), which will provide technicians with direct access to several maintenance information systems and data bases. A fundamental requirement for IMIS to succeed is the capability to author, find, merge, sort, update, and display graphics and technical information. APS provides the means to generate, store, organize, retrieve, and display electronic technical order information. The APS data base provides the flexibility required to represent the complex interrelated data found in technical orders. (FY88)

Maintenance Diagnostic Aiding System (MDAS). An important function of the Integrated Maintenance Information System (IMIS) will be its ability to aid the maintenance technician in troubleshooting sophisticated weapon systems. The basis of MDAS is to provide a tool that closely models how equipment behaves under failure and offers the best diagnostic or repair activities to the technician during troubleshooting. MDAS rank-orders available tests by finding the test which subdivides the set of suspected faults such that the probability of failure for those faults being tested is approximately equal to the failure probability of those not tested. Probabilities are based on Mean Time To Failure. Test times are then considered so that tests requiring the shortest time are moved to the top of the list of recommended tests, all other things being equal. (FY88)

Advanced Visual Technology System (AVTS). The AVTS computer image generator (CIG) was designed to provide visual "out-the-window" and multisensor imagery for the full spectrum of tactical air missions. This includes air-to-surface weapons delivery, low-level flight, acquisition of surface-to-air missiles, evasive maneuvers, and normal flight operations such as takeoff, landing, and aerial refueling. The CIG hardware and software are compatible with different types of display systems and provide high-quality, realistic imagery for combat simulations. A data processing technique called "area processing" reduces the amount of computer hardware required and overcomes the technical limits of other CIG systems. This technology is being marketed by General Electric under the trade name of Compuscene IV. Another product from this AVTS effort is a high-resolution, limited-field-of-view dome visual display originally developed for evaluation
of Army helicopter nap-of-the-earth training effectiveness. The helicopter cockpit has now been
replaced with an F-16A cockpit to be used in high-speed, low-altitude flight training
effectiveness and air-to-air and air-to-ground combat studies. The AVTS also provides imagery
to an A-10 tactical research simulator and a visual imagery testbed facility. (FY88)

Design Analysis Models (CREW CHIEF). CREW CHIEF is a computer-based anthropometric computer
graphics design and analysis tool (and supporting data base) that models Air Force technicians
for use in performing mockup-type computer-aided evaluations of new weapon systems and equipment
designs. Human-like characteristics such as standing, sitting, squatting, crawling, lifting,
pulling, and tool usage are featured in the model. This model encompasses both male and female
technicians and maintenance work in both standard work clothes and protective equipment. The
model can evaluate a proposed design in maintainability terms such as accessibility of equipment,
tool usage within access areas, maintenance operations and task requirements, and load lifting
requirements. It can be used by designers to do on-line analysis during early stages of the design cycle. A beta test version of the model has been released to industry. (FY88)

CUSTOMERS: ASD, AFALC, Industry; NASA has expressed interest in these tools for use in analysis of space operations

Integrated Electronic Warfare System (INEWS). The INEWS is the electronic warfare component which will be used on the Advanced Tactical Fighter (ATF) and the Advanced Tactical Aircraft (ATA). Because of its importance to the mission of these aircraft, additional funds were provided to the INEWS system program office (SPO) to reduce the risk associated with supporting the system. As part of the Supportability Risk Reduction Program, the SPO initiated the INEWS Reliability, Availability, and Maintainability in Computer-Aided Design (RAMCAD) effort. The goal of this effort was to use RAMCAD technology to improve the initial design of the INEWS. AFHRL personnel helped to write a portion of the INEWS Request for Proposals (RFP) and participated in the source selection. The objectives of the effort were to provide real-time supportability feedback, shorten design time, and sensitize the designers to design impacts of reliability, maintainability, and testability. The INEWS program was the first major DOD program to use RAMCAD as part of the source selection process to apply to initial design. Demonstrations of the INEWS - RAMCAD capability are being conducted at the close of the Demonstration/Validation phase. (FY88)

Model Aircrew Training System (MATS). The MATS program was undertaken in response to a USAF Scientific Advisory Board mandate to make C-130 aircrew training more efficient so that mission-critical resources can be devoted to raising combat skill levels. The MATS documentation provides: (a) a detailed review and analysis of C-130 mission and task requirements; (b) a review of state-of-the-art training technology and system evaluation techniques; (c) a review of current C-130 training resources and practices; and (d) a description of the system architecture for a mission-oriented, proficiency-based training system. Specific recommendations are provided for implementation of a new integrated approach to training for the C-130 which is individualized and self-paced and utilizes concepts from modern learning theory. A computer-based subsystem is also recommended for the delivery and management of instruction, as well as the allocation and scheduling of all training resources, including the aircraft. The findings and recommendations from the MATS effort have been utilized by the Training Systems Program Office of the Aeronautical Systems Division in the development of the RFP for the C-130 Aircrew Training System (ATS). They have also been used by MAC Headquarters as a basis in planning for the implementation, test, and evaluation of the new C-130 ATS and have been provided to all bidders on the C-130 ATS RFP for guidance. In addition, the findings and lessons from this effort have been applied to a number of other programs including the C-5 and C-17. (FY86)

C-130 Visual Requirements. Two studies were conducted concerning field-of-view (FOV) requirements for C-130 weapon system trainers at Little Rock AFB, AR. The first study investigated the effects of eliminating peripheral visual information on assault landings using experienced C-130 pilots. The results indicated no adverse effects for this task. The second study investigated the effects of eliminating peripheral visual information on low-level navigation and airdrop maneuvers. Pilot eye position was also monitored. The results indicated that pilots could still perform the task without the peripheral windows but that they adopted a different visual behavior pattern in order to do so. A third study, which involved scene content, investigated the effects of enhanced detail (texture patterns and vertical development) on performance of assault landings. The results indicated enhanced performance in the high-detail scene condition. (FY88)

POINT OF CONTACT: Lt Kevin Dixon, AFHRL/OTE, (602) 988-6561, AUTOVON 474-6561
Basic Electronic Combat Part-Task Trainer (ECPTT). The purpose of the ECPTT is to provide training on electronic combat (EC) systems (i.e., radar warning receiver (RWR), expendables (chaff/flares), and electronic countermeasures (ECM) systems), threats, and basic tactics to TAC pilots for a variety of aircraft (e.g., A-10, F-16). Current training in these areas consists of some academics and book study, limited familiarization training in the flight simulator, and infrequent in-flight practice at EC ranges. The basic ECPTT consists of training at three levels. The first level provides system familiarization and allows practice in system operation. Level two addresses threat information, providing a consolidated, interactive "catalog" of information on threat capabilities, parameters, operations, and appropriate tactics. Level three is a gaming mode, which allows the pilot to "fly" through a variety of tactical scenarios. The pilot receives appropriate RWR cues and is able to employ expendables, ECM, and maneuvering to avoid/defeat threats. The device's displays and controls are driven via a microprocessor-based simulation, which will also generate tactical scenarios and associated cues and provide feedback on pilot actions. (FY87)

POINT OF CONTACT: Mr. Gary Boyle, AFHRL/OTU, (602) 988-6561, AUTOVON 474-6561

Threat System Relative Lethality Values. The Air Staff and HQ TAC requested statistical support in the development of threat system relative lethality values for a Tactical Air Forces Mission Planning System (TAF MPS). TAF MPS is an automated system that will integrate weapons delivery, flight planning, and penetration analysis to select preferred routes through a battlefield. The amount of time available for flight planning is becoming shorter as targets become more mobile. The TAF MPS algorithm is designed to emulate the expert flight planner, with a much shorter response time. Air Force-wide agreed-upon relative lethality values for certain surface-to-air missiles and radar-directed guns as a function of range and altitude do not exist. To identify these values, AFHRL provided consultative support in the development, administration, and analysis of a survey which captured the policies of experienced personnel in rating the relative effectiveness of certain ground-to-air weapon systems. The sample of expert raters was comprised of 44 pilots, navigators, electronic warfare officers, and nonrated personnel from various intelligence and operational organizations. AFHRL performed interrater reliability analysis to determine the degree of interrater agreement. AFHRL then computed descriptive statistics and performed curve fitting analyses to describe relative lethality as a function of range for each altitude/threat system combination. This R&D project provides TAC with the threat system relative lethality data necessary to make the TAF MPS operational. (FY88)

POINT OF CONTACT: Dr. Sherrie Gott, AFHRL/MOMJ, (512) 536-3942, AUTOVON 240-3942
Low-Altitude Awareness Trainer. This effort produced a part-task training system that uses an interactive videodisc containing aerial views and graphics to teach pilots to recognize low-altitude visual phenomena. The videodisc can be utilized in either a classroom or self-paced instruction environment to teach the visual aspects of low-altitude flight. Interactive videodiscs have the capacity for 30 minutes of programming per side. A computer program encoded digitally on the disc makes interaction with the student possible. Menus prompt the student to select various subjects. Picture stops, still frames, and motion sequences are arranged on the disc in a manner that correlates with the overall instructional design. This interactive videodisc technology application is strictly an experimental product for field evaluation. In the project's current phase, the trainer will be used as a classroom aid only. The overall objective of this effort was to determine the extent to which microcomputer technology can address a variety of cognitive task elements for training programs. (FY86)

Air Combat Expert Simulation (ACES). ACES simulates decision making by expert fighter pilots in air-to-air combat. The actual program is on disk and runs on an IBM-PC with expanded memory. The ACES model is a desktop training system that engages the student in a series of mock combat situations, allowing the student pilots to learn about conditions that call for particular maneuvers. The ACES model predicts the selection of an air combat maneuver given the scenario of 1 vs 1 engagement. Selection rules are incorporated to determine which basic fighter maneuver to execute, given a description of an airspace with two competing T-38 aircraft. The aircraft are displayed in three-dimensional graphics. Maneuvers may be selected for either aircraft by either a user or ACES. The selection of maneuvers by ACES compares favorably with selections made by expert fighter pilots. Future developments include expanding from T-38 only to F-15 and F-16 domains, enhancing the three-dimensional graphics, and increasing from a classical maneuver to a tactical mode (from one move at a time to one, two, or three moves at a time). (FY87)

Methodology for Generating Efficiency and Effectiveness Measures (MGEEM). The MGEEM is a multi-step productivity measurement and enhancement procedure which brings the managers and workers of an organization to consensus about the principal intended accomplishments of the organization called Key Result Areas (KRAs), and means of measuring each KRA, called indicators. Once the indicators are developed, MGEEM then graphically links them to levels of effectiveness on contingency charts. Multiple indicators and units can be aggregated upward to derive higher-level organizational productivity measures. Data to support the indicators come from the existing management information and reporting systems. Feedback to employees and supervisors, along with goal setting and incentives, can improve the level of unit productivity. The MGEEM is being transitioned to the Air Force Management Engineering Agency (AFMEA) to support implementation of AFR 25-5, Air Force Management Engineering Program. (FY88)

CUSTOMERS: AFMEA, ESC, AFOSP, AFLC, Navy

POINT OF CONTACT: Lt Michael J. Zimmerman, AFHRL/MOMD, (512) 536-3942, AUTOVON 240-3942
Microcomputer Intelligence for Technical Training (MITT I/II). An Intelligent Tutoring System (ITS) was developed to train Air Force and civilian flight controllers at NASA to diagnose and repair malfunctions of the space shuttle fuel cell system. Knowledge engineering techniques were used to elicit the domain knowledge necessary to build a complete training system, as well as the necessary pedagogical approach for presenting the domain knowledge. Most significantly, this project demonstrates the capability to design and implement robust, intelligent training systems within a microcomputer environment. Previous ITSs have been built on expensive, special-purpose computer hardware. This effort delivered prototype ITS software packages executable on the AT&T 6300 or the Zenith-248. The effort also provided operating instructions, student handbooks, source code, and written documentation supporting the sequence of steps integrated into the building of the system. (FY88)

POINT OF CONTACT: Capt Kevin Kline, AFHRL/IDI, (512) 536-2981, AUTOVON 240-2981

Unified Data Base (UDB) for Acquisition Logistics. The UDB is a Logistics Support Analysis Record (LSAR) data base system designed to improve the documentation and accessibility of acquisition logistics support data. UDB provides a data information and decision support system which enables logisticians and engineers to rapidly and efficiently document, retrieve, and query a central data base online via a computer terminal. UDB conforms to MIL-STD-1388-2A and automates all the data elements of this standard, through the addition of data elements supplemental to the military standard. The system may also be used to automate common acquisition data items. The UDB has been transitioned to the Air Force Acquisition Logistics Center (AFALC). (FY88)

Instructional Support System (ISS). ISS is a computer-based training (CBT) tool for development, delivery, and management of computerized instruction. It operates on the Digital Equipment Corporation (DEC) VAX family of computers, ranging from a MicroVAX II to an 8600 under the VMS operating system and the Zenith-248 under the MS-DOS operating system. ISS was developed as an Ada research project to port a mainframe-based, hardware-dependent CBT system to a minicomputer and achieve hardware independence. It was rehosted (2nd Quarter of FY88) to the Zenith-248 to provide Air Force and DOD users a powerful, standardized, low-cost, Government-owned training system. Recent additions to ISS include videodisc; microcomputer computer-managed instruction (CMI); enhanced system documentation; and stand-alone, exportable CAI and CMI training materials. (FY88)

CUSTOMERS: SAC, AFIT, AFLC, HSD, ESD, NASA, AFSC, ASD, Army, Navy

AIR FORCE HUMAN RESOURCES LABORATORY

Systems Analysis of Control and Reporting Center Operations. AFHRL studied the processes used by Air Force Control and Reporting Centers (CRCs) and the potential impacts that new automation and distributed command, control, and communications (C3) operational concepts could have on operator and system performance. This background study laid the foundation for current and planned research with the Modular Control Equipment (MCE). The highly automated MCE will replace the existing equipment in the air defense CRCs in the 1990s. AFHRL technology could help MCE personnel to identify the required personnel skills, training requirements, and design modifications for this new system. (FY86)

Training/Job Requirements System (TJRS). TJRS is a preliminary methodology which uses operational maintenance data to define operator performance and training standards. This system also provides the conceptual mechanisms for dynamically linking maintenance data to the Air Force occupational survey and Specialty Training Standard processes, thereby enhancing their validity and reliability. Specifically, TJRS can: (a) generate reports describing all maintenance tasks performed by individuals over a specified time period; (b) form the basis of aircraft-specific job description reports for each maintenance AFS on a work-center level, base level, or Air Force-wide; and (c) identify maintenance "troubleshoots" where more training is required. This exploratory development work has been used in the development of the Advanced On-the-job Training System (AOTS). (FY86)

First-Generation Decision Support System (DSS). The first version of the DSS is implemented on commercial data base management software. Future expansions will use specialized expert system software. The first-generation DSS asks the user to specify task components and component order. It uses this information, information about component interdependence and skill type, and the reasons a component is difficult to learn or perform to make recommendations about partitioning tasks for training. The results of this effort provide guidelines to partition complex flight tasks that are trained in actual equipment and simulators into parts that can be effectively trained on less expensive systems. This part-task training DSS was a first attempt to determine what an enhanced DSS for part-task training could encompass. A 3-year effort designed to enhance the DSS has been proposed. A fully developed DSS that includes the proposed enhancements would have potential applications to the entire training community. (FY87)

CUSTOMERS: AFHRL; enhanced DDS - SAC, TAC, MAC, ATC
