CHAPTER 1

INTRODUCTION

This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies—for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report.

The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution.
INTRODUCTION

1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:

- To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard
- To attempt to identify any language constructs not supported by the compiler but required by the Ada Standard
- To determine that the implementation-dependent behavior is allowed by the Ada Standard

Testing of this compiler was conducted by SofTech, Inc. under the direction of the AVF according to procedures established by the Ada Joint Program Office and administered by the Ada Validation Organization (AVO). On-site testing was completed 25 May 1988 at Gould, Inc. in Ft. Lauderdale, FL.

1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

Ada Information Clearinghouse
Ada Joint Program Office
OUSDRE
The Pentagon, Rm 3D-139 (Fern Street)
Washington DC 20301-3081

or from:

Ada Validation Facility

1.3 REFERENCES

1.4 DEFINITION OF TERMS

ACVC The Ada Compiler Validation Capability. The set of Ada programs that tests the conformity of an Ada compiler to the Ada programming language.

Ada An Ada Commentary contains all information relevant to the point addressed by a comment on the Ada Standard. These comments are given a unique identification number having the form AI-ddddd.

Applicant The agency requesting validation.

AVF The Ada Validation Facility. The AVF is responsible for conducting compiler validations according to procedures contained in the Ada Compiler Validation Procedures and Guidelines.

AVO The Ada Validation Organization. The AVO has oversight authority over all AVF practices for the purpose of maintaining a uniform process for validation of Ada compilers. The AVO provides administrative and technical
INTRODUCTION

support for Ada validations to ensure consistent practices.

Compiler
A processor for the Ada language. In the context of this report, a compiler is any language processor, including cross-compilers, translators, and interpreters.

Failed test
An ACVC test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.

Host
The computer on which the compiler resides.

Inapplicable test
An ACVC test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.

Passed test
An ACVC test for which a compiler generates the expected result.

Target
The computer for which a compiler generates code.

Test
A program that checks a compiler's conformity regarding a particular feature or a combination of features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files.

Withdrawn test
An ACVC test found to be incorrect and not used to check conformity to the Ada Standard. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.

1.5 ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable, and special program units are used to report their results during execution. Class B tests are expected to produce compilation errors. Class L tests are expected to produce compilation or link errors.

Class A tests check that legal Ada programs can be successfully compiled and executed. There are no explicit program components in a Class A test to check semantics. For example, a Class A test checks that reserved words of another language (other than those already reserved in the Ada language) are not treated as reserved words by an Ada compiler. A Class A test is passed if no errors are detected at compile time and the program executes to produce a PASSED message.
Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that every syntax or semantic error in the test is detected. A Class B test is passed if every illegal construct that it contains is detected by the compiler.

Class C tests check that legal Ada programs can be correctly compiled and executed. Each Class C test is self-checking and produces a PASSED, FAILED, or NOT APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of a compiler. Since there are no capacity requirements placed on a compiler by the Ada Standard for some parameters—for example, the number of identifiers permitted in a compilation or the number of units in a library—a compiler may refuse to compile a Class D test and still be a conforming compiler. Therefore, if a Class D test fails to compile because the capacity of the compiler is exceeded, the test is classified as inapplicable. If a Class D test compiles successfully, it is self-checking and produces a PASSED or FAILED message during execution.

Each Class E test is self-checking and produces a NOT APPLICABLE, PASSED, or FAILED message when it is compiled and executed. However, the Ada Standard permits an implementation to reject programs containing some features addressed by Class E tests during compilation. Therefore, a Class E test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time—that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated.

Two library units, the package REPORT and the procedure CHECK_FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED, or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK_FILE is used to check the contents of text files written by some of the Class C tests for chapter 14 of the Ada Standard. The operation of REPORT and CHECK_FILE is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.

The text of the tests in the ACVC follow conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and
place features that may not be supported by all implementations in separate tests. However, some tests contain values that require the test to be customized according to implementation-specific values—for example, an illegal file name. A list of the values used for this validation is provided in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. The applicability of a test to an implementation is considered each time the implementation is validated. A test that is inapplicable for one validation is not necessarily inapplicable for a subsequent validation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing a compiler. The tests withdrawn at the time of this validation are given in Appendix D.
2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: APLEX Ada Compiler, Revision 2.1
ACVC Version: 1.9
Certificate Number: 880523W1.09054

Host Computer:
- Machine: Gould PowerNode Model 9080
- Operating System: UTX/32S, Revision 1.1
- Memory Size: 16 Mbytes

Target Computer:
- Machine: Gould PowerNode Model 9080
- Operating System: UTX/32S, Revision 1.1
- Memory Size: 16 Mbytes
CONFIGURATION INFORMATION

2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. The tests demonstrate the following characteristics:

- **Capacities.**
  
The compiler correctly processes tests containing loop statements nested to 65 levels, block statements nested to 65 levels, and recursive procedures separately compiled as subunits nested to 17 levels. It correctly processes a compilation containing 723 variables in the same declarative part. (See tests D55A03A..H (8 tests), D56001B, D64005E..G (3 tests), and D29002K.)

- **Universal integer calculations.**
  
  An implementation is allowed to reject universal integer calculations having values that exceed SYSTEM.MAX_INT. This implementation processes 64 bit integer calculations. (See tests D4A002A, D4A002B, D4A004A, and D4A004B.)

- **Predefined types.**
  
  This implementation supports the additional predefined types LONG INTEGER and LONG FLOAT in the package STANDARD. (See tests B86001C and B86001D.)

- **Based literals.**
  
  An implementation is allowed to reject a based literal with a value exceeding SYSTEM.MAX_INT during compilation, or it may raise NUMERIC_ERROR or CONSTRAINT_ERROR during execution. This implementation raises NUMERIC_ERROR during execution. (See test E24101A.)

- **Expression evaluation.**
  
  Apparently some default initialization expressions for record components are evaluated before any value is checked to belong to a component's subtype. (See test C32117A.) Assignments for subtypes are performed with the same precision as the base type. (See test C35712B.)
This implementation uses no extra bits for extra precision. This implementation uses all extra bits for extra range. (See test C35903A.)

NUMERIC_ERROR is raised when an integer literal operand in a comparison or membership test is outside the range of the base type. (See test C45232A.)

No exception is raised when a literal operand in a fixed-point comparison or membership test is outside the range of the base type. (See test C45252A.)

Apparently underflow is not gradual. (See tests C45524A..Z.)

Rounding.

The method used for rounding to integer is apparently round away from zero. (See tests C46012A..Z.)

The method used for rounding to longest integer is apparently round away from zero. (See tests C46012A..Z.)

The method used for rounding to integer in static universal real expressions is apparently round away from zero. (See test C4A014A.)

Array types.

An implementation is allowed to raise NUMERIC_ERROR or CONSTRAINT_ERROR for an array having a 'LENGTH that exceeds STANDARD.INTEGER'LAST and/or SYSTEM.MAX_INT. For this implementation:

Declaration of an array type or subtype declaration with more than SYSTEM.MAX_INT components raises NUMERIC_ERROR. (See test C36003A.)

No exception is raised when 'LENGTH is applied to an array type with INTEGER'LAST + 2 components. (See test C36202A.)

NUMERIC_ERROR is raised when 'LENGTH is applied to an array type with SYSTEM.MAX_INT + 2 components. (See test C36202B.)

A packed BOOLEAN array having a 'LENGTH exceeding INTEGER'LAST raises NUMERIC_ERROR when the array type is declared. (See test C52103X.)

A packed two-dimensional BOOLEAN array with more than INTEGER'LAST components raises NUMERIC_ERROR when the array type is declared. (See test C52104Y.)
CONFIGURATION INFORMATION

A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC_ERROR or CONSTRAINT_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises NUMERIC_ERROR when the array type is declared. (See test E52103Y.)

In assigning one-dimensional array types, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. In assigning two-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

. Discriminated types.

During compilation, an implementation is allowed to either accept or reject an incomplete type with discriminants that is used in an access type definition with a compatible discriminant constraint. This implementation accepts such subtype indications. (See test E38104A.)

In assigning record types with discriminants, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

. Aggregates.

In the evaluation of a multi-dimensional aggregate, index subtype checks appear to be made as choices are evaluated. (See tests C43207A and C43207B.)

In the evaluation of an aggregate containing subaggregates, not all choices are evaluated before being checked for identical bounds. (See test E43212B.)

All choices are evaluated before CONSTRAINT_ERROR is raised if a bound in a nonnull range of a nonnull aggregate does not belong to an index subtype. (See test E43211B.)

. Representation clauses.

An implementation might legitimately place restrictions on representation clauses used by some of the tests. If a representation clause is used by a test in a way that violates a restriction, then the implementation must reject it.
Enumeration representation clauses containing noncontiguous values for enumeration types other than character and boolean types are supported. (See tests C355021..J, C35502M..N, and A39005F.)

Enumeration representation clauses containing noncontiguous values for character types are supported. (See tests C35507I..J, C35507M..N, and C55B16A.)

Enumeration representation clauses for boolean types containing representational values other than (FALSE => 0, TRUE => 1) are not supported. (See tests C35508I..J and C35508M..N.)

Length clauses with SIZE specifications for enumeration types are supported with the requirement that the types alignment must be maintained. (See test A39005B.)

Length clauses with STORAGE_SIZE specifications for access types are supported. (See tests A39005C and C87B62B.)

Length clauses with STORAGE_SIZE specifications for task types are supported. (See tests A39005D and C87B62D.)

Length clauses with SMALL specifications are supported. (See tests A39005E and C87B62C.)

Record representation clauses are supported with the exception that the record component's alignment must be maintained. (See test A39005G.)

Length clauses with SIZE specifications for derived integer types are supported. (See test C87B62A.)

Pragmas.

The pragma INLINE is not supported for library functions. (See tests LA3004A, LA3004B, EA3004C, EA3004D, CA3004E, and CA3004F.)

Input/output.

The package SEQUENTIAL_IO cannot be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101C, EE2201D, and EE2201E.)

The package DIRECT_IO cannot be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101H, EE2401D, and EE2401G.)

Modes IN_FILE and OUT_FILE are supported for SEQUENTIAL_IO. (See tests CE2102D and CE2102E.)
Modes INFILE, OUTFILE, and INOUT_FILE are supported for DIRECT_IO. (See tests CE2102F, CE2102I, and CE2102J.)

RESET and DELETE are supported for SEQUENTIAL_IO and DIRECT_IO. (See tests CE2102J and CE2102K.)

Dynamic creation and deletion of files are supported for SEQUENTIAL_IO and DIRECT_IO. (See tests CE2106A and CE2106B.)

Overwriting to a sequential file truncates the file to last element written. (See test CE2208B.)

An existing text file can be opened in OUTFILE mode, can be created in OUTFILE mode, and can be created in INFILE mode. (See test EE3102C.)

More than one internal file can be associated with each external file for text I/O for reading only. (See tests CE3111A..E (5 tests), CE3114B, and CE3115A.)

More than one internal file can be associated with each external file for sequential I/O for reading only. (See tests CE2107A..D (4 tests), CE2110B, and CE2111D.)

More than one internal file can be associated with each external file for direct I/O for reading only. (See tests CE2107F..I (5 tests), CE2110B, and CE2111H.)

An internal sequential access file and an internal direct access file cannot be associated with a single external file for writing. (See test CE2107E.)

An external file associated with more than one internal file cannot be deleted for SEQUENTIAL_IO, DIRECT_IO, and TEXT_IO. (See test CE2110B.)

Temporary sequential files are given names. Temporary direct files are given names. Temporary files given names are not deleted when they are closed. (See tests CE2108A and CE2108C.)

Generics.

Generic subprogram declarations and bodies can be compiled in separate compilations only if the body is compiled before any instantiations. (See tests CA1012A and CA2009F.)

Generic package declarations and bodies can be compiled in separate compilations only if the body is compiled before any instantiations. (See tests CA2009C, BC3204C, and BC3205D.)
Generic unit bodies and their subunits can be compiled in separate compilations. (See test CA3011A.)
CHAPTER 3
TEST INFORMATION

3.1 TEST RESULTS

Version 1.9 of the ACVC comprises 3122 tests. When this compiler was tested, 27 tests had been withdrawn because of test errors. The AVF determined that 277 tests were inapplicable to this implementation. All inapplicable tests were processed during validation testing except for 215 executable tests that use floating-point precision exceeding that supported by the implementation and 15 executable tests that use file operations not supported by the implementation. Modifications to the code, processing, or grading for 12 tests were required to successfully demonstrate the test objective. (See section 3.6.)

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

3.4 WITHDRAWN TESTS

The following 27 tests were withdrawn from ACVC Version 1.9 at the time of this validation:

B28003A  C35904B  C37215E  C45332A  CC1311B
E28005C  C35A03E  C37215G  C45614C  BC3105A
C34004A  C35A03R  C37215H  A74106C  AD1A01A
C35502P  C37213H  C38102C  C85018B  CE2401H
A35902C  C37213J  C41402A  C87B04B  CE3208A
C35904A  C37215C

See Appendix D for the reason that each of these tests was withdrawn.

3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. The applicability of a test to an implementation is considered each time a validation is attempted. A test that is inapplicable for one validation attempt is not necessarily inapplicable for a subsequent attempt. For this validation attempt, 276 tests were inapplicable for the reasons indicated:

- C35508I..J (2 tests) and C35508M..N (2 tests) use enumeration representation clauses for boolean types containing representational values other than (FALSE => 0, TRUE => 1). These clauses are not supported by this compiler.
- C35702A uses SHORT_FLOAT which is not supported by this implementation.
. A39005B uses a form of a length clauses with SIZE specifications for enumeration types which are not supported by this compiler.

. A39005G uses a form of a record representation clause which is not supported by this compiler.

. The following tests use SHORT_INTEGER, which is not supported by this compiler:

C45231B  C45304B  C45502B  C45503B  C45504B
C45504E  C45611B  C45613B  C45614B  C45631B
C45632B  B52004E  C55B07B  B55B09D

. C45231D requires a macro substitution for any predefined numeric types other than INTEGER, SHORT_INTEGER, LONG_INTEGER, FLOAT, SHORT_FLOAT, and LONG_FLOAT. This compiler does not support any such types.

. C45531M, C45531N, C45532M, and C45532N use fine 48-bit fixed-point base types which are not supported by this compiler.

. C45531O, C45531P, C45532O, and C45532P use coarse 48-bit fixed-point base types which are not supported by this compiler.

. C45651A declares a fixed-point type which is not representable by this implementation.

. C52008B declares a record type with four discriminants of type integer and having default values. The type may be used in the declaration of unconstrained objects, but the size of these objects exceeds the maximum object size of this implementation, and NUMERIC_ERROR is raised.

. B86001D requires a predefined numeric type other than those defined by the Ada language in package STANDARD. There is no such type for this implementation.

. C86001F redefines package SYSTEM, but TEXT_IO is made obsolete by this new definition in this implementation and the test cannot be executed since the package REPORT is dependent on the package TEXT_IO.

. CA2009C and CA2009F contain instantiations of generics in cases where the body is not available at the time of the instantiation. As allowed by AI-00408/07, this compiler creates a dependency on the missing body so that when the actual body is compiled, the unit containing the instantiation becomes obsolete.

. CA3004F, EA3004D, and LA3004B use the INLINE pragma for library units, which is not supported by this compiler.
3.6 TEST, PROCESSING, AND EVALUATION MODIFICATIONS

It is expected that some tests will require modifications of code, processing, or evaluation in order to compensate for legitimate implementation behavior. Modifications are made by the AVF in cases where legitimate implementation behavior prevents the successful completion of an (otherwise) applicable test. Examples of such modifications include: adding a length clause to alter the default size of a collection; splitting a Class B test into subtests so that all errors are detected; and confirming that messages produced by an executable test demonstrate conforming behavior that wasn't anticipated by the test (such as raising one exception instead of another).

Modifications were required for 11 Class B tests and 1 Class E test.

The following Class B tests were split because syntax errors at one point resulted in the compiler not detecting other errors in the test:

B27005A  B71001K  BA3006A  BA3007B  BA3008B
BA1101C  BA3006B  BA3008A  BA3013A

3-4
E28002D, B28001R, and B28001V were modified by adding "PRAGMA LIST(ON);" as the first line of each file. If the first legal occurrence of a LIST pragma has the parameter ON, then the implementation does not generate any listing until the pragma occurs. The Ada Standard states that it is implementation-dependent whether the initial listing state is ON or OFF.

3.7 ADDITIONAL TESTING INFORMATION

3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.9 produced by the APLEX Ada Compiler, Revision 2.1 was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and the compiler exhibited the expected behavior on all inapplicable tests.

3.7.2 Test Method

Testing of the APLEX Ada Compiler, Revision 2.1 using ACVC Version 1.9 was conducted on-site by a validation team from the AVF. The configuration consisted of a Gould PowerNode Model 9080 host/target operating under UTX/32S, Revision 1.1.

A magnetic tape containing all tests except for withdrawn tests and tests requiring unsupported floating-point precisions was taken on-site by the validation team for processing. Tests that make use of implementation-specific values were customized before being written to the magnetic tape. Tests requiring modifications during the prevalidation testing were included in their modified form on the magnetic tape.

The contents of the magnetic tape were loaded directly onto the host computer. After the test files were loaded to disk, the full set of tests was compiled and linked on the Gould PowerNode Model 9080, and all executable tests were run. Results were printed from the host computer.

The compiler was tested using command scripts provided by Gould, Inc. and reviewed by the validation team. The compiler was tested using all default option settings except for the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>-c</td>
<td>Produce source listing</td>
</tr>
<tr>
<td>-i</td>
<td>Process pragma inline</td>
</tr>
</tbody>
</table>

Tests were compiled, linked, and executed (as appropriate) using a single computer. Test output, compilation listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.
TEST INFORMATION

3.7.3 Test Site

Testing was conducted at Gould, Inc. in Ft. Lauderdale, FL and was completed on 25 May 1988.
APPENDIX A

DECLARATION OF CONFORMANCE

Gould, Inc. has submitted the following Declaration of Conformance concerning the APLEX Ada Compiler, Revision 2.1.
DECLARATION OF CONFORMANCE

Compiler Implementor: Tei-soft, Inc.
Ada Validation Facility: ASD/SCEL, Wright-Patterson AFB, OH
Ada Compiler Validation Capability (ACVC) Version: 1.9

Base Configuration

Base Compiler Name: APL.x™ Ada Compiler Revision: 2.1
Host Architecture ISA: Gould PowerNode Model 9080
Target Architecture ISA: Gould PowerNode Model 9080
OS&VER #: UTX/32S Revision 1.1

Derived Compiler Registration

Derived Compiler Name: APLEX™ Ada Compiler Revision: 2.1
Host Architecture ISA: Gould PowerNode Model 90XX
Target Architecture ISA: Gould PowerNode Model 90XX
OS&VER #: UTX/32S Revision 1.1

Derived Compiler Registration

Derived Compiler Name: APLEX™ Ada Compiler Revision: 2.1
Host Architecture ISA: Gould PowerNode Model 60XX
Target Architecture ISA: Gould PowerNode Model 60XX
OS&VER #: UTX/32S Revision 1.1

Derived Compiler Registration

Derived Compiler Name: APLEX™ Ada Compiler Revision: 2.1
Host Architecture ISA: Gould PowerNode Model 90XX

Implementor's Declaration

I, the undersigned, representing TeleSoft, Inc., have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler listed in this declaration. I declare that Gould Inc. is the owner of record of the Ada language compiler listed above and, as such, is responsible for maintaining said compiler in conformance to ANSI/MIL-STD-1815A. All certificates and registrations for Ada language compiler listed in this declaration shall be made only in the owner's corporate name.

Ray Parra, Director of Contracts/Legal

Owner's Declaration

I, the undersigned, representing Gould Inc., take full responsibility for implementation and maintenance of the Ada compiler listed above, and agree to the public disclosure of the final Validation Summary Report. I further agree to continue to comply with the Ada trademark policy, as defined by the Ada Joint Program Office. I declare that all of the Ada language compilers listed, and their host/target performance are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A. I have reviewed the Validation Summary Report for the compiler and concur with the contents. I also affirm that the PowerNode computer architectures listed herein (90XX and 60XX models) are of equivalent architecture to the PowerNode 9080 as described in the attached documentation which was submitted with our 1.8 validations.

Mary F. Macomber, Senior Manager, Major Corporate Agreements

Date: July 29, 1988

APPENDIX B
APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the APLEX Ada Compiler, Revision 2.1, are described in the following sections, which discuss topics in Appendix F of the Ada Standard. Implementation-specific portions of the package STANDARD are also included in this appendix.

package STANDARD is
  ...
  type INTEGER is range -(2**31) .. (2**31) - 1;
  type LONGINTEGER is range -(2**63) .. (2**63) - 1;
  type FLOAT is digits 6 range -7.23698E+75 .. 7.23698E+75;
  type LONG_FLOAT is digits 14
     range -7.2370055773320E+75 .. 7.2370055773320E+75;
  type DURATION is delta 2#1.0#E-14 range -86_400.0 .. 86_400.0;
  ...
end STANDARD;
APPENDIX F OF THE LANGUAGE REFERENCE MANUAL

1 Implementation Dependent Pragmas
2 Implementation Dependent Attributes
3 Specification of Package SYSTEM
4 Restrictions of representation clauses
5 Implementation dependent naming
6 Interpretation of expressions in address clauses
7 Restrictions on unchecked conversions
8 I/O Package Characteristics

(1) Implementation Dependent Pragmas

The following pragmas are supported:

- COMMENT
- ELABORATE
- IMAGES
- INTERFACE
- INLINE
- LIST
- LINKNAME
- PACK
- PAGE
- PRIORITY
- SHARED
- SUPPRESS

The implementation-defined pragma COMMENT embeds the text of a string literal within the object file of the compilation unit containing the pragma. The syntax is:

pragma COMMENT ("text of the comment");

This pragma may appear at any location within the source code of an Ada unit. There is no restriction on the number of comments that may be used.
The implementation defined pragma images controls where the code to support the "images" attribute for an enumeration type is generated. The syntax is:

```
pragma IMAGES (<enum_name>, "DEFERRED" | "IMMEDIATE");
```

<enum_name> must be the name of a previously defined enumeration type. This pragma must appear in the same package specification or declarative part as the type definition. If the "Immediate" parameter is used, the code for the "images" attribute is generated in the compilation unit where the type definition appears. This is the default. If "Deferred" is specified, the code is generated in any compilation unit which references the "images" attribute. Note that if no references are made to the "images" attribute, no code is ever generated.

Pragma LINKNAME is used to associate a string with the name of a routine in the object code. The syntax is:

```
pragma LINKNAME (<ada_name>, <string>);
```

The <ada_name> must be the name of an Ada routine which previously appeared in a pragma INTERFACE. The effect of this pragma is to use the <string> as the name for the routine in the object code for the unit. Thus,

```
function Hyperbolic_Sin (X: Float) return Float;
pragma INTERFACE (Assembly, Hyperbolic_Sin);
pragma LINKNAME (Hyperbolic_Sin, ":HSIN:");
```

would cause the compiler to use the string ":HSIN:" in the object code whenever referring to the Ada routine "Hyperbolic_Sin".

When interfacing to C, Fortran, or Pascal, the compiler still forces the name in the object code to correspond to the appropriate convention. Thus, for C, the first character of the name has an underscore substituted. Fortran has an underscore added in front of and behind the name, and Pascal has an underscore added in front and two underscores added behind the given name.

The ON parameter of pragma SUPPRESS is not supported.

Pragma Inline is not supported for library units.

(2) Implementation Dependent Attributes

There are no implementation-defined attributes.
(3) The specification of package SYSTEM:

    package SYSTEM is

    type ADDRESS is private;
    type NAME is (Gould_UTX, Gould_MPX);
    SYSTEM_NAME : constant NAME := Gould_UTX; -- for

    -- or
    SYSTEM_NAME : constant NAME := Gould_MPX; -- for Concept

    STORAGE_UNIT : constant := 8;
    MEMORY_SIZE : constant := 2**24-1; -- for Concept/Powernode
    -- or
    MEMORY_SIZE : constant := 2**30-1; -- for NPL

    -- System-Dependent Declarations

    subtype BYTE is INTEGER range 0 .. 2**8-1;
    subtype INTEGER_16 is INTEGER range -2**15 .. 2**15-1;
    subtype INTEGER_32 is INTEGER; -- range -2**31 .. 2**31-1;

    -- System-Dependent Named Numbers

    MIN_INT : constant := -(2**63);
    MAX_INT : constant := (2**63)-1;
    MAX_DIGITS: constant := 14;
    MAX_MANTISSA: constant := 31;
    FINE_DELTA: constant := 1.0/2.0**MAX_MANTISSA;
    TICK: constant := 1.0/(2.0**14);

    -- Other System Dependent Declarations

    MAX_OBJECT_SIZE : constant := MEMORY_SIZE;
    MAX_RECORD_COUNT : constant := MAX_INT;
    MAX_TEXT_IO_COUNT: constant := MAX_INT-2;
    MAX_TEXT_IO_FIELD: constant := 1000;

    subtype PRIORITY is INTEGER range 0 .. 255;

    NULL_ADDRESS : constant ADDRESS;

    private

    type ADDRESS is new INTEGER_32;
    NULL_ADDRESS : constant ADDRESS := 0;

    end SYSTEM;
(4) The list of all restrictions on representation clauses.

The compiler supports the following representation clauses:
- Length Clauses for types 'Size (LRM 13.2(a))
- Length Clauses for collections 'Storage_Size (LRM 13.2(b))
- Length Clauses for tasks 'Storage_Size (LRM 13.2(c))
- Length clause for fixed point types (LRM 13.2(d)).

Enumeration representation clauses (LRM 13.3) are supported with the restriction that they cannot be used to alter values of the predefined type BOOLEAN.

Record representation clauses (LRM 13.4) are supported. The maximum significant value for the expression following "at mod" is 8.

Only records whose components are all statically sized may be the subject of a representation specification, i.e., those containing dynamically sized components may not be the subjects.

A composite type used as a component of a representation specified record must be aligned to preserve the alignment of its constituent components.

Address Clauses (LRM 13.5) are supported for objects.

Address clauses for entries are supported for Bare Machine targets only.

The following representation clauses are not supported:

Address clauses for subprograms, packages, and tasks.

(5) The conventions used for any implementation-generated name denoting implementation-dependent components.

There are no system generated names for implementation-dependent components.

(6) The interpretation of expressions that appear in address clauses.

Expressions that appear in address specifications are interpreted as the first storage unit of the object.

(7) Any restriction on unchecked conversions

Unchecked conversions are allowed between variables of types (or subtypes) T1 and T2 provided that:
- they have the same static size
- they are not unconstrained array types
- they are not private (unless they are subtypes of, or are derived from the private type System.Address.)
(8) Any implementation-dependent characteristics of the input-output packages.

Instantiations of DIRECT_IO and SEQUENTIAL_IO are supported with the following exceptions:

- unconstrained array types
- unconstrained types with discriminants without default values, on UTX and MPX targets only.
- multiple internal files opened to the same external file may only be opened for reading on UTX only
- multiple internal files may not be opened to the same external file on MPX or BMA.

In package DIRECT_IO:

\[
\text{type COUNT is range 0 .. MAX_INT;}
\]

In package TEXT_IO:

\[
\text{type COUNT is range 0 .. MAX_INT-2;}
\]

In package TEXT_IO:

\[
\text{subtype FIELD is INTEGER range 0 .. 1000;}
\]

- The line length limit for MPX is 253 characters.
Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below.

<table>
<thead>
<tr>
<th>Name and Meaning</th>
<th>Value</th>

TEST PARAMETERS

Name and Meaning

$MAX_LEN_INT_BASED_LITERAL

A universal integer based literal whose value is 2#11# with enough leading zeroes in the mantissa to be MAX_IN_LEN long.

$MAX_LEN_REAL_BASED_LITERAL

A universal real based literal whose value is 16:F.E: with enough leading zeroes in the mantissa to be MAX_IN_LEN long.

$MAX_STRING_LITERAL

A string literal of size MAX_IN_LEN, including the quote characters.

$MIN_INT

A universal integer literal whose value is SYSTEM.MIN_INT.

$NAME

A name of a predefined numeric type other than FLOAT, INTEGER, SHORT_FLOAT, SHORT_INTEGER, LONG_FLOAT, or LONG_INTEGER.

$NEG_BASED_INT

A based integer literal whose highest order nonzero bit falls in the sign bit position of the representation for SYSTEM.MAX_INT.

Value

(1..2 => "2:", 3..197 => '0', 198..200 => "11:")

(1..3 => "16:", 4..196 => '0', 197..200 => "F.E:")

(1 => "'", 2..199 => 'A', 200 => "'")

-(2**63)

NO_SUCH_TYPE

16#FFFFFFFFFFFFFFFFFFFE#
APPENDIX D
WITHDRAWN TESTS

Some tests are withdrawn from the ACVC because they do not conform to the Ada Standard. The following 27 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form "AI-ddddd" is to an Ada Commentary.

- **B28003A**: A basic declaration (line 36) incorrectly follows a later declaration.

- **E28005C**: This test requires that "PRAGMA LIST (ON);" not appear in a listing that has been suspended by a previous "PRAGMA LIST (OFF);"; the Ada Standard is not clear on this point, and the matter will be reviewed by the AJPO.

- **C34004A**: The expression in line 168 yields a value outside the range of the target type T, but there is no handler for CONSTRAINT_ERROR.

- **C35502P**: The equality operators in lines 62 and 69 should be inequality operators.

- **A35902C**: The assignment in line 17 of the nominal upper bound of a fixed-point type to an object raises CONSTRAINT_ERROR, for that value lies outside of the actual range of the type.

- **C35904A**: The elaboration of the fixed-point subtype on line 28 wrongly raises CONSTRAINT_ERROR, because its upper bound exceeds that of the type.

- **C35904B**: The subtype declaration that is expected to raise CONSTRAINT_ERROR when its compatibility is checked against that of various types passed as actual generic parameters, may, in fact, raise NUMERIC_ERROR or CONSTRAINT_ERROR for reasons not anticipated by the test.
WITHDRAWN TESTS

- C35A03E and C35A03R: These tests assume that attribute 'MANTISSA returns 0 when applied to a fixed-point type with a null range, but the Ada Standard does not support this assumption.

- C37213H: The subtype declaration of SCONS in line 100 is incorrectly expected to raise an exception when elaborated.

- C37213J: The aggregate in line 451 incorrectly raises CONSTRAINT_ERROR.

- C37215C, C37215E, C37215G, and C37215H: Various discriminant constraints are incorrectly expected to be incompatible with type CONS.

- C38102C: The fixed-point conversion on line 23 wrongly raises CONSTRAINT_ERROR.

- C41402A: The attribute 'STORAGE_SIZE is incorrectly applied to an object of an access type.

- C45332A: The test expects that either an expression in line 52 will raise an exception or else MACHINE_OVERFLOWS is FALSE. However, an implementation may evaluate the expression correctly using a type with a wider range than the base type of the operands, and MACHINE_OVERFLOWS may still be TRUE.

- C45614C: The function call of IDENT_INT in line 15 uses an argument of the wrong type.

- A74106C, C8510B, C87B04E, and C93111B: A bound specified in a fixed-point subtype declaration lies outside of that calculated for the base type, raising CONSTRAINT_ERROR. Errors of this sort occur at lines 37 & 59, 142 & 143, 16 & 48, and 252 & 253 of the four tests, respectively.

- BC3105A: Lines 159 through 168 expect error messages, but these lines are correct Ada.

- AD1A04A: The declaration of subtype SINT3 raises CONSTRAINT_ERROR for implementations which select INT'SIZE to be 16 or greater.

- CE2401H: The record aggregates in lines 105 and 117 contain the wrong values.

- CE3208A: This test expects that an attempt to open the default output file (after it was closed) with mode IN_FILE raises NAME_ERROR or USE_ERROR; by Commentary AI-00048, MODE_ERROR should be raised.

D-2
