CHAPTER 1

INTRODUCTION

This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies—for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report.

The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution.
INTRODUCTION

1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:

- To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard
- To attempt to identify any language constructs not supported by the compiler but required by the Ada Standard
- To determine that the implementation-dependent behavior is allowed by the Ada Standard

Testing of this compiler was conducted by Softech, Inc., under the direction of the AVF according to procedures established by the Ada Joint Program Office and administered by the Ada Validation Organization (AVO). On-site testing was completed 30 May 1988 at Herzelia, Israel.

1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

1.3 REFERENCES

1.4 DEFINITION OF TERMS

ACVC The Ada Compiler Validation Capability. The set of Ada programs that tests the conformity of an Ada compiler to the Ada programming language.

Ada Commentary An Ada Commentary contains all information relevant to the point addressed by a comment on the Ada Standard. These comments are given a unique identification number having the form AI-#####.

Applicant The agency requesting validation.

AVF The Ada Validation Facility. The AVF is responsible for conducting compiler validations according to procedures contained in the Ada Compiler Validation Procedures and Guidelines.
INTRODUCTION

AVO The Ada Validation Organization. The AVO has oversight authority over all AVF practices for the purpose of maintaining a uniform process for validation of Ada compilers. The AVO provides administrative and technical support for Ada validations to ensure consistent practices.

Compiler A processor for the Ada language. In the context of this report, a compiler is any language processor, including cross-compilers, translators, and interpreters.

Failed test An ACVC test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.

Host The computer on which the compiler resides.

Inapplicable test An ACVC test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.

Passed test An ACVC test for which a compiler generates the expected result.

Target The computer for which a compiler generates code.

Test A program that checks a compiler's conformity regarding a particular feature or a combination of features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files.

Withdrawn test An ACVC test found to be incorrect and not used to check conformity to the Ada Standard. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.

1.5 ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable, and special program units are used to report their results during execution. Class B tests are expected to produce compilation errors. Class L tests are expected to produce compilation or link errors.

Class A tests check that legal Ada programs can be successfully compiled and executed. There are no explicit program components in a Class A test to check semantics. For example, a Class A test checks that reserved words of another language (other than those already reserved in the Ada language) are not treated as reserved words by an Ada compiler. A Class A test is
INTRODUCTION

passed if no errors are detected at compile time and the program executes to produce a PASSED message.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that every syntax or semantic error in the test is detected. A Class B test is passed if every illegal construct that it contains is detected by the compiler.

Class C tests check that legal Ada programs can be correctly compiled and executed. Each Class C test is self-checking and produces a PASSED, FAILED, or NOT APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of a compiler. Since there are no capacity requirements placed on a compiler by the Ada Standard for some parameters—for example, the number of identifiers permitted in a compilation or the number of units in a library—a compiler may refuse to compile a Class D test and still be a conforming compiler. Therefore, if a Class D test fails to compile because the capacity of the compiler is exceeded, the test is classified as inapplicable. If a Class D test compiles successfully, it is self-checking and produces a PASSED or FAILED message during execution.

Each Class E test is self-checking and produces a NOT APPLICABLE, PASSED, or FAILED message when it is compiled and executed. However, the Ada Standard permits an implementation to reject programs containing some features addressed by Class E tests during compilation. Therefore, a Class E test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time—that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated.

Two library units, the package REPORT and the procedure CHECK_FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED, or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK_FILE is used to check the contents of text files written by some of the Class C tests for chapter 14 of the Ada Standard. The operation of REPORT and CHECK_FILE is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.
INTRODUCTION

The text of the tests in the ACVC follow conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and place features that may not be supported by all implementations in separate tests. However, some tests contain values that require the test to be customized according to implementation-specific values—for example, an illegal file name. A list of the values used for this validation is provided in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. The applicability of a test to an implementation is considered each time the implementation is validated. A test that is inapplicable for one validation is not necessarily inapplicable for a subsequent validation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing a compiler. The tests withdrawn at the time of this validation are given in Appendix D.
CHAPTER 2
CONFIGURATION INFORMATION

2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: AI-ADA/020, Version 1.0
ACVC Version: 1.9
Certificate Number: 880520W1.09061

Host Computer:
  Machine: DEC MicroVAX II
  Operating System: MicroVMS, Version 4.5
  Memory Size: 9 megabytes

Target Computer:
  Machine: Motorola MVME 133 board (MC68020)
  Operating System: (bare)
  Memory Size: 1 megabyte

Communications: RS-232
CONFIGURATION INFORMATION

2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. The tests demonstrate the following characteristics:

. Capacities.

The compiler correctly processes tests containing loop statements nested to 65 levels, block statements nested to 65 levels, and recursive procedures separately compiled as subunits nested to 17 levels. It correctly processes a compilation containing 723 variables in the same declarative part. (See tests D55A03A..H (8 tests), D56001B, D64005E..G (3 tests), and D29002K.)

. Universal integer calculations.

An implementation is allowed to reject universal integer calculations having values that exceed SYSTEM.MAX_INT. This implementation processes 64 bit integer calculations. (See tests D4A002A, D4A002B, D4A004A, and D4A004B.)

. Predefined types.

This implementation supports the additional predefined types SHORT_INTEGER, LONG_INTEGER, SHORT_FLOAT, and LONG_FLOAT in the package STANDARD. (See tests B86001C and B86001D.)

. Based literals.

An implementation is allowed to reject a based literal with a value exceeding SYSTEM.MAX_INT during compilation, or it may raise NUMERIC_ERROR or CONSTRAINT_ERROR during execution. This implementation raises NUMERIC_ERROR during execution. (See test E24101A.)

. Expression evaluation.

Apparently some default initialization expressions for record components are evaluated before any value is checked to belong to a component's subtype. (See test C32117A.)

Assignments for subtypes are performed with the same precision as the base type. (See test C35712B.)
This implementation uses no extra bits for extra precision and uses all extra bits for extra range. (See test C35903A.)

Apparently NUMERIC_ERROR is raised when an integer literal operand in a comparison or membership test is outside the range of the base type. (See test C45232A.)

Apparently NUMERIC_ERROR is raised when a literal operand in a fixed-point comparison or membership test is outside the range of the base type. (See test C45252A.)

Apparently underflow is gradual. (See tests C45524A..Z.)

Rounding.

The method used for rounding to integer is apparently round to even. (See tests C46012A..Z.)

The method used for rounding to longest integer is apparently round to even. (See tests C46012A..Z.)

The method used for rounding to integer in static universal real expressions is apparently round away from zero. (See test C4A014A.)

Array types.

An implementation is allowed to raise NUMERIC_ERROR or CONSTRAINT_ERROR for an array having a 'LENGTH that exceeds STANDARD.INTEGER'LAST and/or SYSTEM.MAX_INT. For this implementation:

Declaration of an array type or subtype declaration with more than SYSTEM.MAX_INT components raises NUMERIC_ERROR only for a two-dimensional array when the big dimension is the second one. Otherwise, no exception is raised. (See test C36003A.)

CONSTRAINT_ERROR is raised when 'LENGTH is applied to an array type with INTEGER'LAST + 2 components. (See test C36202A.)

NUMERIC_ERROR is raised when 'LENGTH is applied to an array type with SYSTEM.MAX_INT + 2 components. (See test C36202B.)

A packed BOOLEAN array having a 'LENGTH exceeding INTEGER'LAST raises no exception. (See test C52103X.)

A packed two-dimensional BOOLEAN array with more than INTEGER'LAST components raises CONSTRAINT_ERROR when the length of a dimension is calculated and exceeds INTEGER'LAST. (See test C52104Y.)
A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC_ERROR or CONSTRAINT_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises no exception. (See test E52103Y.)

In assigning one-dimensional array types, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. In assigning two-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

Discriminated types.

During compilation, an implementation is allowed to either accept or reject an incomplete type with discriminants that is used in an access type definition with a compatible discriminant constraint. This implementation accepts such subtype indications. (See test E38104A.)

In assigning record types with discriminants, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

Aggregates.

In the evaluation of a multi-dimensional aggregate, all choices appear to be evaluated before checking against the index type. (See tests C43207A and C43207B.)

In the evaluation of an aggregate containing subaggregates, all choices are evaluated before being checked for identical bounds. (See test E43212B.)

Not all choices are evaluated before CONSTRAINT_ERROR is raised if a bound in anonnull range of a nonnull aggregate does not belong to an index subtype. (See test E43211B.)

Representation clauses.

An implementation might legitimately place restrictions on representation clauses used by some of the tests. If a representation clause is used by a test in a way that violates a restriction, then the implementation must reject it.
CONFIGURATION INFORMATION

Enumeration representation clauses containing noncontiguous values for enumeration types other than character and boolean types are supported. (See tests C35502I..J, C35502M..N, and A39005F.)

Enumeration representation clauses containing noncontiguous values for character types are supported. (See tests C35507I..J, C35507M..N, and C55B16A.)

Enumeration representation clauses for boolean types containing representational values other than (FALSE => 0, TRUE => 1) are supported. (See tests C35508I..J and C35508M..N.)

Length clauses with SIZE specifications for enumeration types are supported. (See test A39005B.)

Length clauses with STORAGE_SIZE specifications for access types are not supported. (See tests A39005C and C87B62B.)

Length clauses with STORAGE_SIZE specifications for task types are not supported. (See tests A39005D and C87B62D.)

Length clauses with SMALL specifications are supported. (See tests A39005E and C87B62C.)

Record representation clauses are not supported. (See test A39005G.)

Length clauses with SIZE specifications for derived integer types are supported. (See test C87B62A.)

. Pragmas.

The pragma INLINE is supported for procedures and functions. (See tests LA3004A, LA3004B, EA3004C, EA3004D, CA3004E, and CA3004F.)

. Input/output.

The package SEQUENTIAL_IO can be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101C, EE2201D, and EE2201E.)

The package DIRECT_IO can be instantiated with unconstrained array types and unconstrained record types with discriminants without defaults. (See tests AE2101H, EE2401D, and EE2401G.)

The director, AJPO, has determined (AI-00332) that every call to OPEN and CREATE must raise USE_ERROR or NAME_ERROR if file input/output is not supported. This implementation exhibits this behavior for SEQUENTIAL_IO, DIRECT_IO, and TEXT_IO.
Configuration Information

1. Generics.

Generic declarations and bodies can be compiled in separate compilations only when the instantiation occurs after the body. (See tests CA1012A, CA2009C, CA2009F, BC3204C, and BC3205D.)

Generic unit bodies and their subunits can be compiled in separate compilations. (See test CA3011A.)
3.1 TEST RESULTS

Version 1.9 of the ACVC comprises 3122 tests. When this compiler was tested, 27 had been withdrawn because of test errors. The AVF determined that 363 tests were inapplicable to this implementation. All inapplicable tests were processed during validation testing except for 159 executable tests that use floating-point precision exceeding that supported by the implementation and 172 executable tests that use file operations not supported by the implementation. Modifications to the code, processing, or grading for eight tests were required to successfully demonstrate the test objective. (See section 3.6.)

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

3.4 WITHDRAWN TESTS

The following 27 tests were withdrawn from ACVC Version 1.9 at the time of this validation:

- B28003A
- C28005C
- C34004A
- C35502P
- A35902C
- C35904A
- C35904B
- C35A03E
- C35A03R
- C37213H
- C37213J
- C37215C
- C37215G
- C37215E
- C37215H
- C38102C
- C41402A
- C45332A
- C45614C
- A74106C
- C45614E
- C45614F
- C45614G
- C45614H
- AD1AO1A
- CE2401H
- CE3208A

See Appendix D for the reason that each of these tests was withdrawn.

3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. The applicability of a test to an implementation is considered each time a validation is attempted. A test that is inapplicable for one validation attempt is not necessarily inapplicable for a subsequent attempt. For this validation attempt, 363 tests were inapplicable for the reasons indicated:

- C24113I..N (6 tests) are inapplicable because they contain real literals whose lengths exceed this implementation's maximum line length.
- A39005C and C87B62B use a STORAGE_SIZE clause for an access type, which is not supported by this implementation.
A39005D and C87B62D use a STORAGE_SIZE clause for a task type, which is not supported by this implementation.

C45231D and B86001D require a macro substitution for any predefined numeric types other than INTEGER, SHORT_INTEGER, LONG_INTEGER, FLOAT, SHORT_FLOAT, and LONG_FLOAT. This implementation does not support any such types.

C45531M, C45531N, C45532M, and C45532N use fine 48-bit fixed-point base types which are not supported by this implementation.

C455310, C45531P, C455320, and C45532P use coarse 48-bit fixed-point base types which are not supported by this implementation.

C4A013B uses a static value that is outside the range of the most accurate floating-point base type. The declaration was rejected at compile time.

C96005B requires the range of type DURATION to be different from those of its base type; in this implementation they are the same.

CA2009C and BC3205D compile generic package specifications and bodies in separate compilations. This implementation requires that generic package specifications and bodies be in a single compilation.

CA2009F and BC3204C compile generic subprogram declarations and bodies in separate compilations. This implementation requires that generic subprogram declarations and bodies be in a single compilation.
TEST INFORMATION

The following 178 tests are inapplicable because sequential, text, and direct access files are not supported:

CE2102C   CE2102G..H(2)   CE2102K   CE2104A..D(4)
CE2115A..B(2)   CE2201A..C(3)   EE2201D..E(2)   CE2201F..G(2)
CE2204A..B(2)   CE2205B   EE2401E..F(2)   EE2401G   CE2404A
CE2405B   CE2406A   CE2407A   CE2408A

The following 159 tests require a floating-point accuracy that exceeds the maximum of 18 digits supported by this implementation:

C241130..Y (11 tests)   C453210..Y (11 tests)
C357060..Y (11 tests)   C454210..Y (11 tests)
C357050..Y (11 tests)   C455210..Z (12 tests)
C357070..Y (11 tests)   C455240..Z (12 tests)
C357080..Y (11 tests)   C456210..Z (12 tests)
C358020..Z (12 tests)   C456410..Y (11 tests)
C452410..Y (11 tests)   C460120..Z (12 tests)

3.6 TEST, PROCESSING, AND EVALUATION MODIFICATIONS

It is expected that some tests will require modifications of code, processing, or evaluation in order to compensate for legitimate implementation behavior. Modifications are made by the AVF in cases where legitimate implementation behavior prevents the successful completion of an (otherwise) applicable test. Examples of such modifications include: adding a length clause to alter the default size of a collection; splitting a Class B test into subtests so that all errors are detected; and confirming that messages produced by an executable test demonstrate conforming behavior that wasn't anticipated by the test (such as raising one exception instead of another).
Modifications were required to the following eight Class B tests because syntax errors at one point resulted in the compiler not detecting other errors in the test:

B33301A  B55A01A  B67001A  B67001C  B67001D
BC1109A  BC1109C  BC1109D

3.7 ADDITIONAL TESTING INFORMATION

3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.9 produced by the AI-ADA/020, Version 1.0, Ada compiler was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and that the compiler exhibited the expected behavior on all inapplicable tests.

3.7.2 Test Method

Testing of the AI-ADA/020, Version 1.0, Ada compiler using ACVC Version 1.9 was conducted on-site by a validation team from the AVF. The configuration consisted of a DEC MicroVAX II host operating under MicroVMS, Version 4.5, and a bare Motorola MVME 133 board (MC68020) target. The host and target computers were linked via RS-232.

A cartridge tape containing all of the tests, except for the withdrawn tests and the tests requiring unsupported floating-point precisions, was taken on-site by the validation team for processing. Tests that make use of implementation-specific values were customized before being written to the magnetic tape. Tests requiring modifications during the prevalidation testing were included in their modified form on the magnetic tape.

The contents of the tape were loaded directly onto the host computer. After the test files were loaded to disk, the full set of tests was compiled and linked on the DEC MicroVAX II, and all executable tests were run on the Motorola MVME 133 board (MC68020). Object files were linked on the host computer, and executable images were transferred to the target computer via RS-232. Results were transferred to the host computer from where they were transferred to a VAX-11/750 and printed.

The compiler was tested using command scripts provided by Aitech Software Engineering Ltd., and reviewed by the validation team. The compiler was tested using all default switch settings except for the following:
TEST INFORMATION

Switch                      Effect
-------------------------------
PROGRESS                    shows compiler progress during compilation
LIST                        produces a compilation listing

Tests were compiled, linked, and executed (as appropriate) using a single host computer and a single target computer. Test output, compilation listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.

3.7.3 Test Site

Testing was conducted at Herzelia, Israel and was completed on 30 May 1988.
Aitech Software Engineering Ltd. has submitted the following Declaration of Conformance concerning the AI-ADA/020, Version 1.0, Ada compiler.
DECLARATION OF CONFORMANCE

Compiler Implementer:                     Aitech Software Engineering Ltd.
Ada Validation Facility:                  ASD/SCEL, Wright-Patterson AFB
Ada Compiler Validation Capability (ACVC) Version: 1.9

Base Configuration

Base Compiler Name:                      AI-ADA/020       Version: 1.0
Host Architecture:                      ISA: MicroVAX II  OS&VER#MicroVMS, Version 4.5
Target Architecture:                    ISA: Motorola MVME OS&VER#bare
                                            133 board

Implementer’s Declaration

I, the undersigned, representing Aitech Software Engineering Ltd. have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler tested in this declaration. I declare that Aitech Software Engineering Ltd. is the owner of record of the Ada language compiler listed above and, as such, is responsible for maintaining said compiler in conformance to ANSI/MIL-STD-1815A. All certificates and registrations for the Ada language compiler listed in this declaration shall be made only in the owner’s corporate name.

Owner’s Declaration

I, the undersigned, representing Aitech Software Engineering Ltd. take full responsibility for implementation and maintenance of Ada compiler listed above, and agree to public disclosure of the final Validation Summary Report. I declare that the Ada language compiler listed and its host/target performance are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A.

[Signature]
Date: 30-May-1988

Project Manager
The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of MIL-STD-1815A, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the AI-ADA/020, Version 1.0, are described in the following sections which discuss topics in Appendix F of the Ada Language Reference Manual (ANSI/MIL-STD-1815A). Implementation-specific portions of the package STANDARD are also included in this appendix.

package STANDARD is
...
  type INTEGER is range -32768 .. 32767;
  type SHORT INTEGER is range -128 .. 127;
  type LONG INTEGER is range -2_147_483_648 .. 2_147_483_648;
  type FLOAT is digits 15 range -1.70141E+38 .. 1.70141E+38;
  type SHORT_FLOAT is digits 6
       range -1.6777215E+31 .. 1.6777215E+31;
  type LONG_FLOAT is digits 18
       range -1.615850303565503648605529934797844443001542E+616
              .. +1.615850303565503648605529934797844443001542E+616;
  type DURATION is delta 2#1.0#E-14 range -131_072.0 .. 131_071.0;
...
end STANDARD;
F.0. Introduction

This appendix describes the implementation-dependent characteristics of the
Al ADA/020 Cross Compiler, as required in the Appendix F frame of the Ada

F.1 Implementation-Dependent Pragmas

No implementation-dependent pragmas are defined for Al ADA/020.

F.2 Implementation-Dependent Attributes

No implementation-dependent attributes are defined for Al ADA/020.

F.3 Package SYSTEM

The specification of the package SYSTEM:

```
package SYSTEM is
  type ADDRESS is private;
  subtype PRIORITY is INTEGER range 1..23;
  type NAME is (M68020,M68000);
  SYSTEM NAME: constant NAME := M68020;
  STORAGE UNIT: constant := 16;
  MEMORY SIZE: constant := 2048 * 1024;
  MIN INT: constant := -2 147 483 647 1 - 1
  MAX INT: constant := 2 147 483 647 1 - 1
  MAX DIGITS: constant := 18;
  MAX_MANTISSA: constant := 31;
  FINE DELTA: constant := 2#1.0#E-31;
  TICK: constant := 0.000_001;

end SYSTEM;
```

F.4 Representation Clauses

Representation clauses are supported with the following limitations:

Representation clauses are not allowed for some kinds of derived types.

Length clauses with STORAGE_SIZE are not supported.

Length clauses for enumeration types are limited to sizes 8 or 16 bits.

Enumeration representation clauses are supported only within the range of type
INTEGER.

Record representation clauses are not supported.
F.5 Implementation-Dependent Names for Implementation-Dependent Components

None defined by the compiler.

F.6 Address Clauses

Not supported by the compiler.

F.7 Unchecked Conversion

Not supported by the compiler.

F.8 Input-Output Packages

The implementation supports all requirements of the Ada language.

F.8.1 External Files and File Objects

External files are not supported.

F.8.2 Sequential and Direct Files

Sequential and direct files are not supported. When attempting to access a file, the appropriate exception is raised (see LRM: Chapter 14).

F.8.2.1 Specification of the Package Sequential_10

with BASIC_10 TYPES;
with 10_EXCEPTIONS;

generic

    type ELEMENT_TYPE is private;

package SEQUENTIAL_10 is

APPENDIX C

TEST PARAMETERS

Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below.

<table>
<thead>
<tr>
<th>Name and Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>$BIG_ID1</td>
<td>(1..125 =&gt;'A', 126 =&gt;'1')</td>
</tr>
<tr>
<td>$BIG_ID2</td>
<td>(1..125 =&gt;'A', 126 =&gt;'2')</td>
</tr>
<tr>
<td>$BIG_ID3</td>
<td>(1..63</td>
</tr>
<tr>
<td>$BIG_ID4</td>
<td>(1..63</td>
</tr>
<tr>
<td>$BIG_INT_LIT</td>
<td>(1..123 =&gt;'0', 124..126 =&gt;'298')</td>
</tr>
</tbody>
</table>

$BIG_ID1
Identifier the size of the maximum input line length with varying last character.

$BIG_ID2
Identifier the size of the maximum input line length with varying last character.

$BIG_ID3
Identifier the size of the maximum input line length with varying middle character.

$BIG_ID4
Identifier the size of the maximum input line length with varying middle character.

$BIG_INT_LIT
An integer literal of value 298 with enough leading zeroes so that it is the size of the maximum line length.
## TEST PARAMETERS

<table>
<thead>
<tr>
<th>Name and Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>$BIG_REAL_LIT</strong></td>
<td>A universal real literal of value 690.0 with enough leading zeroes to be the size of the maximum line length.</td>
</tr>
<tr>
<td></td>
<td>(1..120 =&gt; '0', 121..126 =&gt; '69.0E1')</td>

C-3
TEST PARAMETERS

Name and Meaning                      Value

$MAX_LEN_INT_BASED_LITERAL
A universal integer based literal whose value is 2#11# with enough leading zeroes in the mantissa to be MAX_IN_LEN long.

$MAX_LEN_REAL_BASED_LITERAL
A universal real based literal whose value is 16:F.E: with enough leading zeroes in the mantissa to be MAX_IN_LEN long.

$MAX_STRING_LITERAL
A string literal of size MAX_IN_LEN, including the quote characters.

$MIN_INT
A universal integer literal whose value is SYSTEM.MIN_INT.

$NAME
A name of a predefined numeric type other than FLOAT, INTEGER, SHORT_FLOAT, SHORT_INTEGER, LONG_FLOAT, or LONG_INTEGER.

$NEG_BASED_INT
A based integer literal whose highest order nonzero bit falls in the sign bit position of the representation for SYSTEM.MAX_INT.
APPENDIX D
WITHDRAWN TESTS

Some tests are withdrawn from the ACVC because they do not conform to the Ada Standard. The following 27 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form "AI-dddddd" is to an Ada Commentary.

1. B28003A: A basic declaration (line 36) incorrectly follows a later declaration.

2. E28005C: This test requires that "PRAGMA LIST (ON);" not appear in a listing that has been suspended by a previous "PRAGMA LIST (OFF);". The Ada Standard is not clear on this point, and the matter will be reviewed by the AJPO.

3. C34004A: The expression in line 168 yields a value outside the range of the target type T, but there is no handler for CONSTRAINT_ERROR.

4. C35502P: The equality operators in lines 62 and 69 should be inequality operators.

5. A35902C: The assignment in line 17 of the nominal upper bound of a fixed-point type to an object raises CONSTRAINT_ERROR, for that value lies outside of the actual range of the type.

6. C35904A: The elaboration of the fixed-point subtype on line 28 wrongly raises CONSTRAINT_ERROR, because its upper bound exceeds that of the type.

7. C35904B: The subtype declaration that is expected to raise CONSTRAINT_ERROR when its compatibility is checked against that of various types passed as actual generic parameters, may, in fact, raise NUMERIC_ERROR or CONSTRAINT_ERROR for reasons not anticipated by the test.

8. C35A03E and C35A03R: These tests assume that attribute "MANTISSA returns 0 when applied to a fixed-point type with a null range, but the Ada Standard does not support this assumption.
9. C37213H: The subtype declaration of SCONS in line 100 is incorrectly expected to raise an exception when elaborated.

10. C37213J: The aggregate in line 451 incorrectly raises CONSTRAINT_ERROR.

11. C37215C, C37215E, C37215G, and C37215H: Various discriminant constraints are incorrectly expected to be incompatible with type CONS.

12. C38102C: The fixed-point conversion on line 23 wrongly raises CONSTRAINT_ERROR.

13. C41402A: The attribute 'STORAGE_SIZE is incorrectly applied to an object of an access type.

14. C45332A: The test expects that either an expression in line 52 will raise an exception or else MACHINE_OVERFLOW is FALSE. However, an implementation may evaluate the expression correctly using a type with a wider range than the base type of the operands, and MACHINE_OVERFLOW may still be TRUE.

15. C45614C: The function call of IDENT_INT in line 15 uses an argument of the wrong type.

16. A74106C, C85018B, C87B04B, and CC1311B: A bound specified in a fixed-point subtype declaration lies outside of that calculated for the base type, raising CONSTRAINT_ERROR. Errors of this sort occur at lines 37 & 59, 142 & 143, 16 & 48, and 252 & 253 of the four tests, respectively.

17. BC3105A: Lines 159 through 168 expect error messages, but these lines are correct Ada.

18. AD1A01A: The declaration of subtype SINT3 raises CONSTRAINT_ERROR for implementations which select INT'SIZE to be 16 or greater.

19. CE2401H: The record aggregates in lines 105 and 117 contain the wrong values.

20. CE3208A: This test expects that an attempt to open the default output file (after it was closed) with mode IN_FILE raises NAME_ERROR or USE_ERROR; by Commentary AI-00048, MODE_ERROR should be raised.
