CHAPTER 1

INTRODUCTION

This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies—for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report.

The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution.
INTRODUCTION

1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:

- To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard
- To attempt to identify any language constructs not supported by the compiler but required by the Ada Standard
- To determine that the implementation-dependent behavior is allowed by the Ada Standard

Testing of this compiler was conducted by the AVF according to procedures established by the Ada Joint Program Office and administered by the Ada Validation Organization (AVO). On-site testing was completed 88-05-19 at Tartan Laboratories Incorporated in Pittsburgh.

1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. §552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

Ada Information Clearinghouse
Ada Joint Program Office
OUSDRE
The Pentagon, Rm 3D-139 (Fern Street)
Washington DC 20301-3081

or from:

IABG m.b.H., Dept SZT
Einsteinstrasse 20
8012 Ottobrunn
Federal Republic of Germany
Questions regarding this report or the validation test results should be directed to the AVF listed above or to:

1.3 REFERENCES

1.4 DEFINITION OF TERMS

ACVC  The Ada Compiler Validation Capability. The set of Ada programs that tests the conformity of an Ada compiler to the Ada programming language.

Ada Commentary An Ada Commentary contains all information relevant to the point addressed by a comment on the Ada Standard. These comments are given a unique identification number having the form AI-ddddd.

Applicant The agency requesting validation.

AVF The Ada Validation Facility. The AVF is responsible for conducting compiler validations according to procedures contained in the Ada Compiler Validation Procedures and Guidelines.

AVO The Ada Validation Organization. The AVO has oversight authority over all AVF practices for the purpose of maintaining a uniform process for validation of Ada compilers. The AVO provides administrative and technical support for Ada validations to ensure consistent practices.

Compiler A processor for the Ada language. In the context of this report, a compiler is any language processor, including cross-compilers, translators, and interpreters.

Failed test An ACVC test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.

Host The computer on which the compiler resides.

Inapplicable test An ACVC test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.

Passed test An ACVC test for which a compiler generates the expected result.

Target The computer for which a compiler generates code.

Test A program that checks a compiler's conformity regarding a particular feature or a combination of features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files.

Withdrawn test An ACVC test found to be incorrect and not used to check conformity to the Ada Standard. A test may be incorrect
because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.

1.5 ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable, and special program units are used to report their results during execution. Class B tests are expected to produce compilation errors. Class L tests are expected to produce compilation or link errors.

Class A tests check that legal Ada programs can be successfully compiled and executed. There are no explicit program components in a Class A test to check semantics. For example, a Class A test checks that reserved words of another language (other than those already reserved in the Ada language) are not treated as reserved words by an Ada compiler. A Class A test is passed if no errors are detected at compile time and the program executes to produce a PASSED message.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that every syntax or semantic error in the test is detected. A Class B test is passed if every illegal construct that it contains is detected by the compiler.

Class C tests check that legal Ada programs can be correctly compiled and executed. Each Class C test is self-checking and produces a PASSED, FAILED, or NOT APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of a compiler. Since there are no capacity requirements placed on a compiler by the Ada Standard for some parameters—for example, the number of identifiers permitted in a compilation or the number of units in a library—a compiler may refuse to compile a Class D test and still be a conforming compiler. Therefore, if a Class D test fails to compile because the capacity of the compiler is exceeded, the test is classified as inapplicable. If a Class D test compiles successfully, it is self-checking and produces a PASSED or FAILED message during execution.

Each Class E test is self-checking and produces a NOT APPLICABLE, PASSED, or FAILED message when it is compiled and executed. However, the Ada Standard permits an implementation to reject programs containing some features addressed by Class E tests during compilation. Therefore, a Class E test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.
INTRODUCTION

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time—that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated.

Two library units, the package REPORT and the procedure CHECK_FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED, or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK_FILE is used to check the contents of text files written by some of the Class C tests for chapter 14 of the Ada Standard. The operation of REPORT and CHECK_FILE is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.

The text of the tests in the ACVC follow conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and place features that may not be supported by all implementations in separate tests. However, some tests contain values that require the test to be customized according to implementation-specific values—for example, an illegal file name. A list of the values used for this validation is provided in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. The applicability of a test to an implementation is considered each time the implementation is validated. A test that is inapplicable for one validation is not necessarily inapplicable for a subsequent validation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing a compiler. The tests withdrawn at the time of this validation are given in Appendix D.
CHAPTER 2
CONFIGURATION INFORMATION

2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: Norsk Data ND-500 Ada Compiler, Release A00
ACVC Version: 1.9
Certificate Number: 88051911.09131
Host and Target Computer:

Machine: Norsk Data ND-570
Operating System: SINTRAN III
Release K
Memory Size: 5 MByte
Disk System: Pack-one 288 MB
Pack-two 288 MB
Pack-3 140 MB

2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. The tests demonstrate the following characteristics:
. Capacities.
The compiler correctly processes tests containing loop statements
nested to 65 levels, block statements nested to 65 levels, and
recursive procedures separately compiled as subunits nested to 17
levels. It correctly processes a compilation containing 723
variables in the same declarative part. (See tests D55A03A..H (8
tests), D560018, D64005E..G (3 tests), and D29002K.)

. Universal integer calculations.
An implementation is allowed to reject universal integer
calculations having values that exceed SYSTEM.MAX_INT. This
implementation processes 64 bit integer calculations. (See tests
D4A002A, D4A002B, D4A004A, and D4A004B.)

. Predefined types.
This implementation supports the additional predefined type
LONG_FLOAT in the package STANDARD. (See tests B86001C and
B86001D.)

. Based literals.
An implementation is allowed to reject a based literal with a
value exceeding SYSTEM.MAX_INT during compilation, or it may raise
NUMERIC_ERROR or CONSTRAINT_ERROR during execution. This
implementation raises NUMERIC_ERROR (See test E24101A.)

. Expression evaluation.
Apparently some default initialization expressions for record
components are evaluated before any value is checked to belong to
a component's subtype. (See test C32117A.)

Assignments for subtypes are performed with the same precision as
the base type. (See test C35712B.)

This implementation uses no extra bits for extra precision. This
implementation uses all extra bits for extra range. (See test
C35903A.)

Sometimes NUMERIC_ERROR is raised when an integer literal operand
in a comparison or membership test is outside the range of the
base type. (See test C45232A.)

No exception is raised when a literal operand in a fixed-point
comparison or membership test is outside the range of the base
type. (See test C45252A.)
Apparently underflow is not gradual. (See tests C45524A..Z.)

Rounding.

The method used for rounding to integer is apparently round away from zero. (See tests C46012A..Z.)

The method used for rounding to longest integer is apparently round away from zero. (See tests C46012A..Z.)

The method used for rounding to integer in static universal real expressions is round away from zero. (See test C4A014A.)

Array types.

An implementation is allowed to raise NUMERIC_ERROR or CONSTRAINT_ERROR for an array having a 'LENGTH that exceeds STANDARD.INTEGER'LAST and/or SYSTEM.MAX_INT. For this implementation:

Declaration of an array type or subtype declaration with more than SYSTEM.MAX_INT components raises NUMERIC_ERROR. (See test C36003A.)

NUMERIC_ERROR is raised when an array type with INTEGER'LAST + 2 components is declared. (See test C36202A.)

NUMERIC_ERROR is raised when an array type with SYSTEM.MAX_INT + 2 components is declared. (See test C36202B.)

A packed BOOLEAN array having a 'LENGTH exceeding INTEGER'LAST raises NUMERIC_ERROR when the array type is declared. (See test C52103X.)

A packed two-dimensional BOOLEAN array with more than INTEGER'LAST components raises NUMERIC_ERROR when the array type is declared. (See test C52104Y.)

A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC_ERROR or CONSTRAINT_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises NUMERIC_ERROR when the array type is declared. (See test E52103Y.)

In assigning one-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. In assigning two-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when
checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

Discriminated types.

During compilation, an implementation is allowed to either accept or reject an incomplete type with discriminants that is used in an access type definition with a compatible discriminant constraint. This implementation accepts such subtype indications. (See test E38104A.)

In assigning record types with discriminants, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

Aggregates.

In the evaluation of a multi-dimensional aggregate, all choices appear to be evaluated before checking against the index type. (See tests C43207A and C43207B.)

In the evaluation of an aggregate containing subaggregates, not all choices are evaluated before being checked for identical bounds. (See test E43212B.)

All choices are evaluated before CONSTRAINT_ERROR is raised if a bound in a nonnull range of a nonnull aggregate does not belong to an index subtype. (See test E43211B.)

Representation clauses.

An implementation might legitimately place restrictions on representation clauses used by some of the tests. If a representation clause is used by a test in a way that violates a restriction, then the implementation must reject it.

Enumeration representation clauses containing noncontiguous values for enumeration types other than character and boolean types are supported. (See tests C35502I..J, C35502M..N, and A39005F.)

Enumeration representation clauses containing noncontiguous values for character types are supported. (See tests C35507I..J, C35507M..N, and C55B16A.)

Enumeration representation clauses for boolean types containing representational values other than (FALSE => 0, TRUE => 1) are supported. (See tests C35508I..J and C35508M..N.)
Length clauses with SIZE specifications for enumeration types are supported. (See test A39005B.)

Length clauses with STORAGE_SIZE specifications for access types are supported. (See tests A39005C and C87B62B.)

Length clauses with STORAGE_SIZE specifications for task types are supported. (See tests A39005D and C87B62D.)

Length clauses with SMALL specifications are supported. (See tests A39005E and C87B62C.)

Record representation clauses are supported. (See test A39005G.)

Length clauses with SIZE specifications for derived integer types are supported. (See test C87B62A.)

Pragmas.

The pragma INLINE is not supported for procedures. The pragma INLINE is not supported for functions. (See tests LA3004A, LA3004B, EA3004C, EA3004D, CA3004E, and CA3004F.)

Input/output.

The package SEQUENTIAL_IO cannot be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101C, EE2201D, and EE2201E.)

The package DIRECT_IO cannot be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101H, EE2401D, and EE2401G.)

Modes IN_FILE and OUT_FILE are supported for SEQUENTIAL_IO. (See tests CE2102D and CE2102E.)

Modes IN_FILE, OUT_FILE, and INOUT_FILE are supported for DIRECT_IO. (See tests CE2102F, CE2102I, and CE2102J.)

RESET and DELETE are supported for SEQUENTIAL_IO and DIRECT_IO. (See tests CE2102G and CE2102K.)

Dynamic creation and deletion of files are supported for SEQUENTIAL_IO and DIRECT_IO. (See tests CE2106A and CE2106B.)

Overwriting to a sequential file truncates the file to last element written. (See test CE2208B.)

An existing text file can be opened in OUT_FILE mode, can be created in OUT_FILE mode, and can be created in IN_FILE mode. (See test EE3102C.)
Only one internal file can be associated with each external file for text I/O for both reading and writing. (See tests CE3111A..E (5 tests), CE3114B, and CE3115A.)

Only one internal file can be associated with each external file for sequential I/O for both reading and writing. (See tests CE2107A..D (4 tests), CE2110B, and CE2111D.)

Only one internal file can be associated with each external file for direct I/O for both reading and writing. (See tests CE2107F..I (5 tests), CE2110B, and CE2111H.)

An internal sequential access file and an internal direct access file cannot be associated with a single external file for writing. (See test CE2107E.)

Temporary sequential files are given names. Temporary direct files are given names. Temporary files given names are deleted when they are closed. (See tests CE2108A and CE2108C.)

Generics.

Generic subprogram declarations and bodies can be compiled in separate compilations. (See section 3.5 for restrictions. See tests CA1012A and CA2009F.)

Generic package declarations and bodies can be compiled in separate compilations. (See section 3.5 for restrictions. See tests CA2009C, BC3204C, and BC3205D.)

Generic unit bodies and their subunits can be compiled in separate compilations. (See section 3.5 for restrictions. See test CA3011A.)
CHAPTER 3
TEST INFORMATION

3.1 TEST RESULTS

Version 1.9 of the ACVC comprises 3122 tests. When this compiler was tested, 27 tests had been withdrawn because of test errors. The AVF determined that 263 tests were inapplicable to this implementation. All inapplicable tests were processed during validation testing except for 187 executable tests that use floating-point precision exceeding that supported by the implementation. Modifications to the code, processing, or grading for 76 tests were required to successfully demonstrate the test objective. (See section 3.6.)

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

3.4 WITHDRAWN TESTS

The following 27 tests were withdrawn from ACVC Version 1.9 at the time of this validation:

- B28003A
- E28005C
- C34004A
- C35502P
- A35902C
- C35904A
- C35904B
- C35A03E
- C35A03R
- C37213H
- C37213J
- C37215C
- C37215E
- C37215G
- C37215H
- C38102C
- C41402A
- C45332A
- C45614C
- A74106C
- C85018B
- C87B04B
- CCI311B
- BC3IO5A
- ADIAO1A
- CE2401H
- CE3208A

See Appendix D for the reason that each of these tests was withdrawn.

3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. The applicability of a test to an implementation is considered each time a validation is attempted. A test that is inapplicable for one validation attempt is not necessarily inapplicable for a subsequent attempt. For this validation attempt, 263 tests were inapplicable for the reasons indicated:

- E28002D and E28005D use pragmas LIST and PAGE which are ignored by this compiler. This behaviour was ruled acceptable by the AVO (dated 88-01-14).
C35702A uses SHORT_FLOAT which is not supported by this implementation.

The following tests use SHORT_INTEGER, which is not supported by this compiler:

C45231B  C45304B  C45502B  C45503B  C45504B  
C45504E  C45611B  C45613B  C45614B  C45631B  
C45632B  B51204E  C55B07B  B55B09D

The following tests use LONG_INTEGER, which is not supported by this compiler:

C45231C  C45304C  C45502C  C45503C  C45504C  
C45504F  C45611C  C45613C  C45614C  C45631C  
C45632C  B52004D  C55B07A  B55B09C

C45231D requires a macro substitution for any predefined numeric types other than INTEGER, SHORT_INTEGER, LONG_INTEGER, FLOAT, SHORT_FLOAT, and LONG_FLOAT. This compiler does not support any such types.

C45531M, C45531N, C45532M, and C45532N use fine 48-bit fixed-point base types which are not supported by this compiler.

C45531O, C45531P, C45532O, and C45532P use coarse 48-bit fixed-point base types which are not supported by this compiler.

B86001D requires a predefined numeric type other than those defined by the Ada language in package STANDARD. There is no such type for this implementation.

C86001F redefines package SYSTEM, but TEXT_IO is made obsolete by this new definition in this implementation and the test cannot be executed since the package REPORT is dependent on the package TEXT_IO.

CA2009A, CA2009C..D (2 tests), CA2009F, BC3009B..C (2 tests) This compiler enforces the following two rules concerning declarations and proper bodies which are individual compilation units:

- generic bodies must be compiled and completed before their instantiation.
o recompilation of a generic body or any of its transitive subunits makes all units obsolete which instantiate that generic body.

These rules are enforced whether the compilation units are in separate compilation files or not. The rules are in conflict with the said tests. AI408 and AIS06 allow this behaviour until June 1989.

CA3004E, EA3004C, and LA3004A use the INLINE pragma for procedures, which is not supported by this compiler.

CA3004F, EA3004D, and LA3004B use the INLINE pragma for functions, which is not supported by this compiler.

AE2101C, EE2201D, and EE2201E use instantiations of package SEQUENTIAL.IO with unconstrained array types and record types having discriminants without defaults. These instantiations are rejected by this compiler.

AE2101H, EE2401D, and EE2401E use instantiations of package DIRECT.IO with unconstrained array types and record types having discriminants without defaults. These instantiations are rejected by this compiler.

CE2107A..I (9 tests), CE2110B, CE2111D, CE2111H, CE3111B..E (4 tests), and CE3114B are inapplicable because multiple internal files cannot be associated with the same external file for the operations attempted in these tests. The proper exception is raised when operations are attempted which are not supported.

The following 187 tests require a floating-point accuracy that exceeds the maximum of 16 digits supported by this implementation:

C24113M..Y (13 tests) C35705M..Y (13 tests)
C35706M..Y (13 tests) C35707M..Y (13 tests)
C35708M..Y (13 tests) C358D2M..Z (14 tests)
C45241M..Y (13 tests) C45321M..Y (13 tests)
C45421M..Y (13 tests) C45521M..Z (14 tests)
C45524M..Z (14 tests) C45621M..Z (14 tests)
C45641M..Y (13 tests) C46012M..Z (14 tests)
3.6 TEST, PROCESSING, AND EVALUATION MODIFICATIONS

It is expected that some tests will require modifications of code, processing, or evaluation in order to compensate for legitimate implementation behavior. Modifications are made by the AVF in cases where legitimate implementation behavior prevents the successful completion of an (otherwise) applicable test. Examples of such modifications include: adding a length clause to alter the default size of a collection; splitting a Class B test into subtests so that all errors are detected; and confirming that messages produced by an executable test demonstrate conforming behavior that wasn’t anticipated by the test (such as raising one exception instead of another).

Modifications were required for 76 Class B tests.

The following Class B tests were split because syntax errors at one point resulted in the compiler not detecting other errors in the test:

B22003A B24007A B24009A B25002B B32201A B33301A B34007H
B35701A B36171A B36201A B37101A B37102A B37201A B37202A
B37203A B37302A B38003A B38003B B38008A B38008B B38009A
B3809B B38103A B38103B B38103C B38103D B38103E B43201C
B43202C B44001A B48002A B48002B B48002D B48002E B48002G
B48003E B49003A B49003A B49005A B49006A B49007A B49009A B4A010C
B5A20A B5A22A B5A02A B5B02B B59001A B59001C B59001D
B62006B B64001A B67001A B67001B B67001C B67001D B74103E
B74104A B85007A B91003B B91005A B95001A B95003A B95007B
B95031A B95074E BC1002A BC1109A BC1109C BC1202E BC1206A
BC3005B BC3009C

For the two tests BC3204C and BC3205D the compilation order was changed to

BC3204C0, ..C1, ..C2, ..C3M, ..C4, .. CS, ..C6, ..C3M

and

BC3205D0, ..D1, ..D2, ..D1M

respectively. This change was necessary because of the compiler’s rules for separately compiled generic units. When processed in this order the expected error messages were produced for BC3204C3M and BC3205D1M, respectively.

The compilation files for BC3204D and BC3205C consist of several compilation units each. The compilation units for the main procedures are near the beginning of the files. When processing these files unchanged a link error is reported instead of the expected compilation error because of the compiler’s rules for separately compiled generic units. Therefore, the compilation files were changed by appending copies of the main procedures to the end of these files. When processing these second occurrences of the main procedures the expected error messages were generated by the compiler.
Test E28002B checks that predefined or unrecognized pragmas may have arguments involving overloaded identifiers without enough contextual information to resolve the overloading. It also checks the correct processing of pragma LIST. This compiler ignores pragma LIST so that this part of the test was not taken into account when grading the test as passed.

3.7 ADDITIONAL TESTING INFORMATION

3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.9 produced by the Norsk Data ND-500 Ada Compiler was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and the compiler exhibited the expected behavior on all inapplicable tests.

3.7.2 Test Method

Testing of the Norsk Data ND-500 Ada Compiler using ACVC Version 1.9 was conducted on-site by a validation team from the AVF. The configuration consisted of a Norsk Data ND-570 operating under SINTRAN III, Release K.

A magnetic tape containing all tests except for withdrawn tests and tests requiring unsupported floating-point precisions was taken on-site by the validation team for processing. Tests that make use of implementation-specific values were customized before being written to the magnetic tape. Tests requiring modifications during the prevalidation testing were not included in their modified form on the magnetic tape. They were provided by Tartan Laboratories Incorporated and reviewed by the validation team.

The contents of the magnetic tape were not loaded directly onto the host computer. The tests were read on a VAX-750 and transferred to the host computer using an ether-net connection.

After the test files were loaded to disk, the full set of tests was compiled on the Norsk Data ND-570, and all executable tests were linked and run. Results were transferred to the VAX-750 by ether-net where they were checked and archived.

The compiler was tested using command scripts provided by Tartan Laboratories Incorporated and reviewed by the validation team. The compiler was tested using all default switch settings.

Tests were compiled, linked, and executed (as appropriate) using a single host computer. Test output, compilation listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.
3.7.3 Test Site

Testing was conducted at Tartan Laboratories Incorporated in Pittsburgh and was completed on 88-05-19.
APPENDIX A

DECLARATION OF CONFORMANCE

Tartan Laboratories Incorporated has submitted the following Declaration of Conformance concerning the Norsk Data ND-500 Ada Compiler.
DECLARATION OF CONFORMANCE

Compiler Implementor: Tartan Laboratories Incorporated
Ada Validation Facility: IABG m.b.H., Dept. SZT
Ada Compiler Validation Capability (ACVC) Version: 1.9

Base Configuration

Base Compiler Name: Norsk Data ND-500 Ada Compiler
Base Compiler Version: Release A00
Host and Target Computer: ND-570 under Sintran III Release K

Implementor’s Declaration

I, the undersigned, representing Tartan Laboratories Incorporated, have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler(s) listed in this declaration. I declare that Tartan Laboratories Incorporated is the owner of record of the Ada Language compiler(s) listed above and, as such, is responsible for maintaining said compiler(s) in conformance to ANSI/MIL-STD-1815A. All certificates and registrations for Ada Language compiler(s) listed in this declaration shall be made only in the owner’s corporate name.

Donald L. Evans, President

Date: 20 May 88

Owner’s Declaration

I, the undersigned, representing Tartan Laboratories Incorporated, take full responsibility for implementation and maintenance of the Ada compiler(s) listed above, and agree to the public disclosure of the final Validation Summary Report. I further agree to continue to comply with the Ada trademark policy, as defined by the Ada Joint Program Office. I declare that all of the Ada Language compilers listed, and their host/target performance, are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A.

Donald L. Evans, President

Date: 20 May 88
APPENDIX B

APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the Norsk Data ND-500 Ada Compiler, Release AOO, are described in the following sections, which discuss topics in Appendix F of the Ada Standard. Implementation-specific portions of the package STANDARD are also included in this appendix.

package STANDARD is

  type INTEGER is range -2147483648 .. 2147483647;
  type FLOAT is digits 6 range -16#0.7FFF_FF#E+4 .. 16#0.7FFF_FF#E+64;
  type LONG_FLOAT is digits 16 range -160O.7FFF_FFFF#E+64 .. 16#0.7FFFF_FFFF_FFFF#E+64;
  type DURATION is delta 0.02 range -86400.0 .. 86400.0;
  -- DURATION'SMALL = 2#1.0#E-6

end STANDARD;
This appendix contains the information required by appendix F of the LRM.

F.1 Pragmas

F.1.1 Predefined Pragmas

The list below describes which predefined pragmas are supported, and how to simulate the effect of some of those that are not:

- pragmas ELABORATE and PRIORITY are fully supported;
- pragma LIST is ignored, but some control over listings is possible through the LIST command (see page 3-9);
- pragma OPTIMIZE is ignored. The compiler automatically chooses between optimizing time or space aspects according to what is best in the local context. For more information on optimization, see appendix A;
- pragma PAGE is ignored, but its effect can be simulated by inserting form-feed characters into the source file;
- pragma SUPPRESS is ignored, but some control over checking is available through the CONSTRAINT-CHECKS command, (see page 3-5);
- pragma CONTROLLED is ignored. There is no automatic deallocation of the space occupied by access objects until the scope that declared them is left. Manual deallocation is possible through UNCHECKED_DEALLOCATION;
- None of the other predefined pragmas are supported.
F.1.2 Implementation-Defined Pragmas

Pragma LINKAGE_NAME

The pragma LINKAGE_NAME allows the user to specify that a particular character string is to be used as the :NRF symbol name of a given subprogram. LINKAGE_NAME thus makes it easier for external software, such as the Linkage-Loader, to access object code routines.

The pragma has the following format:

```
pragma LINKAGE_NAME (Ada-name, string-constant)
```

"Ada-name" must be the name of a subprogram declared in a package specification.

"string-constant" is the character string to be associated with Ada-name. The string must be entered between double quotes.

LINKAGE_NAME must be placed in the package specification declaring Ada-name, and must occur after the declaration.

Pragma FOREIGN_BODY

If a package specification containing this pragma is compiled, the user may assign a body to the package by using the library command FOREIGN-BODY (see page 4-9). The body can be an :NRF file created by compiling routines written in another language.

The pragma has the following format:

```
pragma FOREIGN_BODY (string-constant)
```

"string-constant" can be anything; for example, the name of the :NRF file you intend to use as a package body, or the name of its source language. The string is displayed by the library command DESCRIBE-UNIT (see page 4-6) when a foreign body is being described. The string must be entered between double quotes.

FOREIGN_BODY must be the first declarative item of any package specification requiring it.

F.2 Implementation-Dependent Attributes

There are no implementation-dependent attributes.
F.3 Specification of Package SYSTEM

package SYSTEM is
  type ADDRESS is new INTEGER;
type NAME is (ND_500);
SYSTEM_NAME : constant NAME := ND_500;
STORAGE_UNIT : constant := 8;
MEMORY_SIZE : constant := 1000000;
MAX_INT : constant := 2147483647;
MIN_INT : constant := -MAX_INT - 1;
MAX_DIGITS : constant := 16;
MAX_MANTISSA : constant := 31;
FINE_DELTA : constant := 2#1.0#e-31;
TICK : constant := 0.02;
subtype PRIORITY is INTEGER range 10 .. 200;
DEFAULT_PRIORITY : constant PRIORITY := PRIORITY'FIRST;
RUNTIME_ERROR : EXCEPTION;
end SYSTEM;

F.4 Restrictions on Representation Clauses

The following restrictions apply to length clauses:

- a length clause of the form T'SIZE is only permitted for a type or first named subtype "T" whose size can be determined at compile time;

- a length clause of the form T'SIZE for a composite type "T" cannot be used to force a smaller size for T's components than established by their default type mapping (see section 8.1.3) or by individual length clauses;

- if a length clause of the form T'STORAGE_SIZE is used, a small amount of the space specified will be used for administration.

The following restriction applies to enumeration representation clauses:

- the integer codes specified in an aggregate must lie between INTEGER'FIRST and INTEGER'LAST.
The following restriction applies to record representation clauses:

- record representation clauses are not permitted for record types having one or more dynamically sized components;
- warnings (see section 5.2) are issued for incorrect or suboptimal clauses.

The following restriction applies to address clauses:

- address clauses are not supported.

F.5 Implementation-Generated Components in Records

The only implementation-generated record components are dope vectors. One such vector exists for each array (held as a record component) whose bounds depend on the record discriminant(s). The user cannot name dope vector components. For more information on dope vectors, see page 8-6.

F.6 Interpretation of Expressions Appearing in Address Clauses

Address clauses are not supported.

F.7 Restrictions on Unchecked Conversions

UNCHECKED_CONVERSION is supported with the following restrictions:

- the sizes of both the source and target type must be known at compile time;
- if type conversion of an array or record is required, the source and target type must have the same size.

For objects other than records and arrays, if the source type is larger than the target type, the bit pattern representing the value of the source object is truncated from the high address end. If the source type is smaller than the target type, the high address end of the target object is packed with zeros.

Instantiations of UNCHECKED_CONVERSION are placed inline.
F.8 Implementation-Dependent Characteristics of the Input-Output Packages

The compiler supports all of the predefined I/O packages except for LOW_LEVEL_IO.

The information below describes the implementation-dependent characteristics of the supported I/O packages:

- SEQUENTIAL_IO and DIRECT_IO may be instantiated on types of any size which is a multiple of STORAGE_UNIT;

- it is not possible to associate two or more internal DIRECT_IO or SEQUENTIAL_IO files with the same external file;

- it is not possible to associate two or more internal TEXT_IO files with the same external file unless all of them have a FILE_MODE of IN_FILE;

- the FORM parameter of the CREATE and OPEN procedures in DIRECT_IO, SEQUENTIAL_IO and TEXT_IO must be a null string. USE_ERROR is raised if FORM is non-null;

- DEVICE_ERROR is raised if the SINTRAN file management routines indicate an error that cannot be mapped onto a predefined Ada exception.

Section F.9 contains the declarations of those implementation-defined types and subtypes that belong to the I/O packages.

F.9 Predefined Language Environment

This section contains the declarations of all types and subtypes designated "implementation-defined" in the LRM (see appendix C and sections 14.2.5 and 14.3.10). Each type/subtype is dealt with under the heading of the package to which it belongs.

Note

The packages MACHINE_CODE and LOW_LEVEL_IO are not supported.
F.9 Package STANDARD

Type DURATION

type DURATION is delta 0.02 range -86400.0 .. 86400.0;

DURATION is defined with the following attributes:

- DURATION'DELTA is 0.02 seconds;
- DURATION'SMALL is 0.015625 seconds;
- DURATION'FIRST is -86400.0 seconds;
- DURATION'LAST is 86400.0 seconds.
Type INTEGER

type INTEGER is range SYSTEM.MIN_INT .. SYSTEM.MAX_INT;

INTEGER is defined with the following attributes:

- INTEGER'FIRST is $-2^{31}$
- INTEGER'LAST is $2^{31} - 1$

Floating point types

type FLOAT is digits 6;

type LONG_FLOAT is digits 16;

The table below specifies the attributes of types FLOAT and LONG_FLOAT. + indicates that a value is approximate.

<table>

APPENDIX C
TEST PARAMETERS

Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below. Ada aggregate notation is used to denote long strings. The multiplication operator is meant to be overloaded to achieve repetition so that e.g. 239 * 'A' is equivalent to (1..239 => 'A').

<table>

A universal real literal of value 690.0 with enough leading zeroes to be the size of the maximum line length.

A string literal which when catenated with BIG\_STRING2 yields the image of BIG\_ID1.

A string literal which when catenated to the end of BIG\_STRING1 yields the image of BIG\_ID1.

A sequence of blanks twenty characters less than the size of the maximum line length.

A universal integer literal whose value is TEXT\_IO.COUNT'LAST.

A universal integer literal whose value is TEXT\_IO.FIELD'LAST.

An external file name that either contains invalid characters or is too long.

An external file name that either contains a wild card character or is too long.

A universal real literal that lies between DURATION'BASE'LAST and DURATION'LAST or any value in the range of DURATION.

APPENDIX D

WITHDRAWN TESTS

Some tests are withdrawn from the ACVC because they do not conform to the Ada Standard. The following 27 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form "AI-ddddd" is to an Ada Commentary.

1. B28003A: A basic declaration (line 36) wrongly follows a later declaration.

2. E28005C: This test requires that 'PRAGMA LIST (ON);' not appear in a listing that has been suspended by a previous "pragma LIST (OFF);"; the Ada Standard is not clear on this point, and the matter will be reviewed by the ARG.

3. C34004A: The expression in line 168 wrongly yields a value outside of the range of the target type T, raising CONSTRAINT_ERROR.

4. C35502P: Equality operators in lines 62 & 69 should be inequality operators.

5. A35902C: Line 17's assignment of the nominal upper bound of a fixed-point type to an object of that type raises CONSTRAINT_ERROR, for that value lies outside of the actual range of the type.

6. C35904A: The elaboration of the fixed-point subtype on line 28 wrongly raises CONSTRAINT_ERROR, because its upper bound exceeds that of the type.

7. C35904B: The subtype declaration that is expected to raise CONSTRAINT_ERROR when its compatibility is checked against that of various types passed as actual generic parameters, may in fact raise NUMERIC_ERROR or CONSTRAINT_ERROR for reasons not anticipated by the test.
WITHDRAWN TESTS

C35A03E, C35A03R: These tests assume that attribute 'MANTISSA returns 0 when applied to a fixed-point type with a null range, but the Ada Standard doesn't support this assumption.

C37213H: The subtype declaration of SCONS in line 100 is wrongly expected to raise an exception when elaborated.

C37213J: The aggregate in line 451 wrongly raises CONSTRAINT_ERROR.

C37215C, C37215E, C37215G, C37215H: Various discriminant constraints are wrongly expected to be incompatible with type CONS.

C38102C: The fixed-point conversion on line 23 wrongly raises CONSTRAINT_ERROR.

C41402A: 'STORAGE_SIZE is wrongly applied to an object of an access type.

C45332A: The test expects that either an expression in line 52 will raise an exception or else MACHINE_OVERFLOW is FALSE. However, an implementation may evaluate the expression correctly using a type with a wider range than the base type of the operands, and MACHINE_OVERFLOW may still be TRUE.

C45614C: REPORT.IDENT_INT has an argument of the wrong type (LONG_INTEGER).

A74106C, C85018B, C87804B, CC13118: A bound specified in a fixed-point subtype declaration lies outside of that calculated for the base type, raising CONSTRAINT_ERROR. Errors of this sort occur in lines 37 & 59, 142 & 143, 16 & 48, and 252 & 253 of the four tests, respectively (and possibly elsewhere).

BC3105A: Lines 159..168 are wrongly expected to be illegal; they are legal.

ADIA01A: The declaration of subtype INT3 raises CONSTRAINT_ERROR for implementations that select INT'SIZE to be 16 or greater.

CE2401H: The record aggregates in lines 105 & 117 contain the wrong values.

CE3208A: This test expects that an attempt to open the default output file (after it was closed) with mode IN_FILE raises NAME_ERROR or USE_ERROR; by Commentary AI-00048, MODE_ERROR should be raised.
