**Abstract:**
Ada* Compiler Validation Summary Report:

Compiler Name: SP-Ada, Version 5.5-300

Certificate Number: 880609A1.09109

Host: BULL DPX 2000 under SPIX Version 31.2

Target: BULL DPX 2000 under SPIX Version 31.2

Testing Completed 9 June, 1988 Using ACVC 1.9

This report has been reviewed and is approved.

This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies—for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report.

The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution.
1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:

. To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard;

. To attempt to identify any unsupported language constructs required by the Ada Standard;

. To determine that the implementation-dependent behavior is allowed by the Ada Standard.

Testing of this compiler was conducted under the direction of the AVF according to policies and procedures established by the Ada Validation Organization (AVO). On-site testing was completed on 9 June, 1988 at CISI Ingénierie at Valbonne, France.

1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. §552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

1.3 REFERENCES

1.4 DEFINITION OF TERMS

ACVC The Ada Compiler Validation Capability. The set of Ada programs that tests the conformity of an Ada compiler to the Ada programming language.

Ada Commentary An Ada Commentary contains all information relevant to the point addressed by a comment on the Ada Standard. These comments are given a unique identification number having the form AI-dddd.

Applicant The agency requesting validation.

AVF The Ada Validation Facility. In the context of this report, the AVF is responsible for conducting compiler validations according to procedures contained in Ada Compiler Validation Procedures and Guidelines.

AVO The Ada Validation Organization. The AVO has oversight authority over all AVF practices for the purpose of maintaining a uniform process for validation of Ada compilers. The AVO provides administrative and technical support for Ada validations to ensure consistent practices.
Compiler  A processor for the Ada language. In the context of this report, a compiler is any language processor, including cross-compilers, translators, and interpreters.

Failed test  An ACVC test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.

Host  The computer on which the compiler resides.

Inapplicable test  An ACVC test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.

Passed test  An ACVC test for which a compiler generates the expected result.

Target  The computer for which a compiler generates code.

Test  An Ada program that checks a compiler’s conformity regarding a particular feature or combination of features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files.

Withdrawn test  An ACVC test found to be incorrect and not used to check conformity to the Ada Standard. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.

1.5 ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable, and special program units are used to report their results during execution. Class B tests are expected to produce compilation errors. Class L tests are expected to produce link errors.

Class A tests check that legal Ada programs can be successfully compiled and executed. However, no checks are performed during execution to see if the test objective has been met. For example, a Class A test checks that reserved words of another language (other than those already reserved in the Ada language) are not treated as reserved words by an Ada compiler. A Class A test is passed if no errors are detected at compile time and the program executes to produce a PASSED message.
INTRODUCTION

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that every syntax or semantic error in the test is detected. A Class B test is passed if every illegal construct that it contains is detected by the compiler.

Class C tests check that legal Ada programs can be correctly compiled and executed. Each Class C test is self-checking and produces a PASSED, FAILED, or NOT APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of a compiler. Since there are no capacity requirements placed on a compiler by the Ada Standard for some parameters—for example, the number of identifiers permitted in a compilation or the number of units in a library—a compiler may refuse to compile a Class D test and still be a conforming compiler. Therefore, if a Class D test fails to compile because the capacity of the compiler is exceeded, the test is classified as inapplicable. If a Class D test compiles successfully, it is self-checking and produces a PASSED or FAILED message during execution.

Each Class E test is self-checking and produces a NOT APPLICABLE, PASSED, or FAILED message when it is compiled and executed. However, the Ada Standard permits an implementation to reject programs containing some features addressed by Class E tests during compilation. Therefore, a Class E test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time—that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated.

Two library units, the package REPORT and the procedure CHECK_FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED, or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK_FILE is used to check the contents of text files written by some of the Class C tests for chapter 14 of the Ada Standard. The operation of these units is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.
The text of the tests in the ACVC follow conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and place features that may not be supported by all implementations in separate tests. However, some tests contain values that require the test to be customized according to implementation-specific values -- for example, an illegal file name. A list of the values used for this validation are listed in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. The applicability of a test to an implementation is considered each time the implementation is validated. A test that is inapplicable for one validation is not necessarily inapplicable for a subsequent validation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing a compiler. The tests withdrawn at the time of validation are given in Appendix D.
CHAPTER 2

CONFIGURATION INFORMATION

2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: SP-Ada, Version 5.5-300
ACVC Version: 1.9
Certificate Number: 880609A1.09109
Host Computer:
  Machine: BULL DPX 2000
  Operating System: SPIX
  Version 31.2
  Memory Size: 8 Mb
Target Computer:
  Machine: BULL DPX 2000
  Operating System: SPIX
  Version 31.2
  Memory Size: 8 Mb
Communications Network: none
2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. The tests demonstrate the following characteristics:

- **Capacities.**
  
  The compiler correctly processes tests containing loop statements nested to 65 levels, block statements nested to 65 levels, and recursive procedures separately compiled as subunits nested to 17 levels. It correctly processes a compilation containing 723 variables in the same declarative part. (See tests D55A03A..H (8 tests), D56001B, D64005E..G (3 tests) and D29002K.)

- **Universal integer calculations.**
  
  An implementation is allowed to reject universal integer calculations having values that exceed SYSTEM.MAX_INT. This implementation processes 64 bit integer calculations. (See tests D4AO02A, D4A002B, D4AO04A, and D4AO04B).

- **Predefined types.**
  
  This implementation supports the additional predefined types TINY_INTEGER, SHORT_INTEGER, and SHORT_FLOAT in the package STANDARD. (See tests B86001C and B86001D.)

- **Based literals.**
  
  An implementation is allowed to reject a based literal with a value exceeding SYSTEM.MAX_INT during compilation, or it may raise NUMERIC_ERROR or CONSTRAINT_ERROR during execution. This implementation raises NUMERIC_ERROR during execution. (See test E24101A.)

- **Expression evaluation.**
  
  Apparently no default initialization expressions for record components are evaluated before any value is checked to belong to a component's subtype. (See test C32117A.)

Assignments for subtypes are performed with the same precision as the base type. (See test C35712B).
This implementation uses no extra bits for extra precision.
This implementation uses all extra bits for extra range.
(See test C35903A).

Sometimes NUMERIC_ERROR is raised when an integer literal operand in a comparison or membership test is outside the range of the base type. (See test C45232A.)

Sometimes NUMERIC_ERROR is raised when a literal operand in a fixed point comparison or membership test is outside the range of the base type. (See test C45252A.)

Apparently underflow is gradual. (See tests C45524A..Z.)

Rounding

The method used for rounding to integer is apparently round to even. (See tests C46012A..Z.)

The method used for rounding to longest integer is apparently round to even. (See tests C46012A..Z.)

The method used for rounding to integer in static universal real expressions is apparently round to even. (See test C4A014A.)

Array types.

An implementation is allowed to raise NUMERIC_ERROR or CONSTRAINT_ERROR for an array having a 'LENGTH that exceeds STANDARD.INTEGER'LAST and/or SYSTEM.MAX_INT. For this implementation:

Declaration of an array type or subtype declaration with more than SYSTEM.MAX_INT components raises no exception. (See test C36003A).

NUMERIC_ERROR is raised when 'LENGTH is applied to an array type with INTEGER'LAST + 2 components. (See test C36202A.)

NUMERIC_ERROR is raised when 'LENGTH is applied to an array type with SYSTEM.MAX_INT + 2 components. (See test C36202B.)

A packed BOOLEAN array having a 'LENGTH exceeding INTEGER'LAST raises NUMERIC_ERROR when the array type is declared. (See test C52103X.)

A packed two-dimensional BOOLEAN array with more than INTEGER'LAST components raises NUMERIC_ERROR when the array type is declared (See test C52104Y.)
A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC_ERROR or CONSTRAINT_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises NUMERIC_ERROR when the array type is declared. (See test E52103Y.)

In assigning one-dimensional array types, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. In assigning two-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

Discriminated types.

During compilation, an implementation is allowed to either accept or reject an incomplete type with discriminants that is used in an access type definition with a compatible discriminant constraint. This implementation accepts such subtype indications. (See test E38104A.)

In assigning record types with discriminants, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

Aggregates.

In the evaluation of a multi-dimensional aggregate, all choices appear to be evaluated before checking against the index type. (See tests C43207A and C43207B.)

In the evaluation of an aggregate containing subaggregates, all choices are evaluated before being checked for identical bounds. (See test E43212B.)

All choices are evaluated before CONSTRAINT_ERROR is raised if a bound in a nonnull range of a nonnull aggregate does not belong to an index subtype. (See test E43211B.)
Representation clauses

An implementation might legitimately place restrictions on representation clauses used by some of the tests. If a representation clause is used by a test in a way that violates a restriction, then the implementation must reject it.

Enumeration representation clauses containing noncontiguous values for enumeration types other than character and boolean types are supported. (See tests C35502I..J, C35502M..N, and A39005F.)

Enumeration representation clauses containing noncontiguous values for character types are supported. (See tests C35507I..J, C35507M..N, and C55B16A.)

Enumeration representation clauses for boolean types containing representational values other than (FALSE => 0, TRUE => 1) are supported. (See tests C35508I..J, C35508M..N.)

Length clauses with SIZE specifications for enumeration types are supported. (See test A39005B.)

Length clauses with STORAGE_SIZE specifications for access types are supported. (See tests A39005C and C87B62B.)

Length clauses with STORAGE_SIZE specifications for task types are supported. (See tests A39005D and C87B62D.)

Length clauses with SMALL specifications are supported. (See tests A39005E and C87B62C.)

Certain record representation clauses are supported, however not the clause appearing in A39005G, which is therefore not applicable.

Length clauses with SIZE specifications for derived integer types are supported. (See test C87B62A.)

Pragmas

The pragma INLINE is supported for procedures. The pragma INLINE is supported for functions. (See tests LA3004A, EA3004C, EA3004D, CA3004E, and CA3004F.)
Input/output.

The package SEQUENTIAL_IO can be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101C, EE2201D, and EE2201E.)

The package DIRECT_IO can be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101H, EE2401D and EE2401G.)

There are strings which are illegal external file names for SEQUENTIAL_IO and DIRECT_IO. (See tests CE2102C and CE2102H.)

Modes IN_FILE and OUT_FILE are supported for SEQUENTIAL_IO (See tests CE2102D and CE2102E.)

Modes IN_FILE, OUT_FILE, and INOUT_FILE are supported for DIRECT_IO. (See tests CE2102F, CE2102I, and CE2102J.)

RESET and DELETE are supported for SEQUENTIAL_IO and DIRECT_IO. (See tests CE2102G and CE2102K.)

Dynamic creation and deletion of files are supported for SEQUENTIAL_IO and DIRECT_IO. (See tests CE2106A and CE2106B.)

Overwriting to a sequential file truncates the file to last element written. (See test CE2208B.)

An existing text file can be opened in OUT_FILE mode, can be created in OUT_FILE mode, and can be created in IN_FILE mode. (See test EE3102C.)

More than one internal file can be associated with each external file for text I/O for both reading and writing. (See tests CE3111A..E (5 tests), CE3114B, and CE3115A.)

More than one internal file can be associated with each external file for sequential I/O for both reading and writing. (See tests CE2107A..D (4 tests) and CE2111D.)

More than one internal file can be associated with each external file for direct I/O for both reading and writing (See tests CE2107E..I (5 tests) and CE2111H.)

An internal sequential access file and an internal direct access file can be associated with a single external file for writing. (See test CE2107E.)
An external file associated with more than one internal file can be deleted for SEQUENTIAL_IO, DIRECT_IO, and TEXT_IO. (See test CE2110B.)

Temporary sequential files are given names. Temporary direct files are given names. Temporary files given names are deleted when they are closed. (See tests CE2108A and CE2108C.)

Generic subprogram declarations and bodies can be compiled in separate compilations. (See tests CA1012A and CA2009F.)

Generic package declarations and bodies can be compiled in separate compilations. (See tests CA2009C, BC3204C, and BC3205D.)

Generic unit bodies and their subunits can be compiled in separate compilations. (See test CA3011A.)
3.1 TEST RESULTS

Version 1.9 of the ACVC comprised 3122 tests. When this compiler was tested, 27 tests had been withdrawn because of test errors. The AVF determined that 227 tests were inapplicable to this implementation. All inapplicable tests were processed during testing except for 201 executable tests that use floating-point precision exceeding that supported by the implementation. Modifications to the code, processing, or grading for 25 tests were required to successfully demonstrate the test objective. (See section 3.6.)

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

3.4 WITHDRAWN TESTS

The following 27 tests were withdrawn from ACVC Version 1.9 at time of this validation:

- B28003A
- E28005C
- C34004A
- C35502P
- A35902C
- C35904A
- C35904B
- C35A03E
- C35A03R
- C37213H
- C37213J
- C37215C
- C37215E
- C37215G
- C37215H
- C38102C
- C41402A
- C45332A
- C45614C
- A74106C
- C85018B
- C87B04B
- CC1331B
- BC3105A
- ADIA01A
- CE2401H
- CE3208A

See Appendix D for the reason that each of these tests was withdrawn.

3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. The applicability of a test to an implementation is considered each time a validation is attempted. A test that is inapplicable for one validation attempt is not necessarily inapplicable for a subsequent attempt. For this validation attempt, 227 tests were inapplicable for the reasons indicated:

- C35702B uses LONG_FLOAT which is not supported by this implementation.
- A39005G uses a record representation clause which is not supported by this compiler.
- The following tests use LONG_INTEGER, which is not supported by this compiler:
  - C45231C
  - C45304C
  - C45502C
  - C45503C
  - C45504C
  - C45504F
  - C45611C
  - C45613C
  - C45614C
  - C45631C
  - C45632C
  - B52004D
  - C55B07A
  - B55B09C
TEST INFORMATION

- C45531M, C45531N, C45532M, and C45532N use fine 48-bit fixed point base types which are not supported by this compiler.

- C45531O, C45531P, C45532O, and C45532P use coarse 48-bit fixed point base types which are not supported by this compiler.

- C86001F redefines package SYSTEM, but TEXT_IO is made obsolete by this new definition in this implementation and the test cannot be executed since the package REPORT is dependent on the package TEXT_IO.

- C96005B requires the range of DURATION to be different from those of its base type; in this implementation they are the same.

- The following 201 tests require a floating-point accuracy that exceeds the maximum of 15 digits supported by this implementation:

  C24113L..Y (14 tests) C35705L..Y (14 tests)
  C35706L..Y (14 tests) C35707L..Y (14 tests)
  C35708L..Y (14 tests) C35802L..Z (15 tests)
  C45241L..Y (14 tests) C45321L..Y (14 tests)
  C45421L..Y (14 tests) C45521L..Z (15 tests)
  C45524L..Z (15 tests) C45621L..Z (15 tests)
  C45641L..Y (14 tests) C46012L..Z (15 tests)

3.6 TEST, PROCESSING, AND EVALUATION MODIFICATIONS

It is expected that some tests will require modifications of code, processing, or evaluation in order to compensate for legitimate implementation behavior. Modifications are made by the AVF in cases where legitimate implementation behavior prevents the successful completion of an (otherwise) applicable test. Examples of such modifications include: adding a length clause to alter the default size of a collection; splitting a Class B test into subtests so that all errors are detected; and confirming that messages produced by an executable test demonstrate conforming behavior that wasn't anticipated by the test (such as raising one exception instead of another).

Modifications were required for 25 Class B tests.

The following 25 Class B tests were split because errors at one point resulted in the compiler not detecting other errors in the test:

B33301A B37201A B38003A B38003B B38009A B38009B B41202A
B44001A B64001A B67001A B67001B B67001C B67001D B91003B
B95001A B97102A BC1303F BC3005C
3.7 ADDITIONAL TESTING INFORMATION

3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.9 produced by SP-Ada, was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and the compiler exhibited the expected behavior on all inapplicable tests.

3.7.2 Test Method

Testing of the SP-Ada using ACVC Version 1.9 was conducted on-site by a validation team from the AVF. The configuration consisted of a BULL DPX 2000 operating under SPIX, Version 31.2.

A tape containing all tests has been sent to CISI Ingénierie for pre-validation. Tests that make use of implementation-specific values were customized by CISI Ingénierie after loading of the tape. At validation time the contents of the tape were not loaded again onto the host computer, but all test sources were checked on-site against those used for prevalidation. The full set of tests was compiled, linked and all executable tests were run. Results were stored on tape after checking.

The compiler was tested using command scripts provided by CISI Ingénierie and reviewed by the validation team. The compiler was tested using all default switch / option settings.

Tests were compiled, linked, and executed (as appropriate) using a single host computer. Test outputs, compilation listings, and job logs were captured on a tape and archived at the AVF. The listings examined on-site by the validation team were also archived.

3.7.3 Test Site

Testing was conducted at Valbonne, France and was completed on 9 June 1988.
CISI Ingénierie has submitted the following conformance statement concerning the SP-Ada.
DECLARATION OF CONFORMANCE

Compiler Implementor: CISI Ingénierie.

Ada* Validation Facility:
AFNOR, Tour Europe, Cedex 7, F-92080 Paris la Défense

Ada Compiler Validation Capability (ACVC) Version: 1.9

Base Configuration

Base Compiler Name: SP-Ada, Version: Version 5.5-300

Host Architecture ISA: BULL DPX 2000 OS&VER #: SPIX, Version 31.2

Target Architecture ISA: BULL DPX 2000 OS&VER #: SPIX, Version 31.2

Implementor's declaration

I, the undersigned, representing CISI Ingénierie, have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler listed in this declaration. I declare that CISI Ingénierie is the owner of record of the Ada language compiler listed above and, as such, is responsible for maintaining said compilers in conformance to ANSI-MIL-STD-1815A. All certificates and registrations for Ada language compiler listed in this declaration shall be made only in the owner's corporate name.

Date: 03 octobre 1988

CISI Ingénierie
Bernard HENNEBELLE, Director of Provence-Est Agency

DECLARATION OF CONFORMANCE

Owner's Declaration

I, the undersigned, representing BULL S.A., take full responsibility for implementation and maintenance of the Ada* compiler listed above, and agree to the public disclosure of the final Validation Summary Report. I further agree to continue to comply with the Ada trademark policy, as defined by the Ada Joint Program Office. I declare that all of the Ada language compilers listed, and their host/target performance are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A.

[Signature]

Date: 3 October 1988

BULL S.A.
Managing Director, M. LUMINEAU

APPENDIX F OF THE Ada STANDARD

APPENDIX B

APPENDIX F OF THE Ada* STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the EMER-Ada, Version 5.5-SPS7/70, are described in the following sections which discuss topics in Appendix F of the Ada Standard. Implementation-specific portions of the package STANDARD are also included in this appendix.

package STANDARD is

... type TINY_INTEGER is range -128 .. 127;
  type SHORT_INTEGER is range -(2**15) .. (2**15-1);
  type INTEGER is range -(2**31) .. (2**31-1);

  type SHORT_FLOAT is digits 6 range
    -3.402_82E+38 .. 3.402_82E+38;

  type FLOAT is digits 15 range
    -1.797_693_134_862_31E+308 .. 1.797_693_134_862_31E+308;

  type DURATION is delta 1.0E-3 range
    -2_147_483.648 .. 2_147_483.647;

  ...

end STANDARD;

*Ada is a registered trademark of the United States Government
(Ada Joint Program Office).
1 Implementation-Dependent Pragmas

1.1. SHARE_BODY pragma

This pragma may be used instead of SHARE_CODE pragma with the same effect.

1.2. SHARE_CODE pragma

The SHARE_CODE pragma takes the name of a generic instantiation or a generic unit as the first argument and one of the identifiers TRUE or FALSE as the second argument. This pragma is only allowed immediately at the place of a declarative item in a declarative part or package specification, or after a library unit in a compilation, but before any subsequent compilation unit.

When the first argument is a generic unit the pragma applies to all instantiations of that generic. When the first argument is the name of a generic instantiation the pragma applies only to the specified instantiation, or overloaded instantiations.

If the second argument is TRUE the compiler will try to share code generated for a generic instantiation with code generated for other instantiations of the same generic. When the second argument is FALSE each instantiation will get a unique copy of the generated code. The extent to which code is shared between instantiations depends on this pragma and the kind of generic formal parameters declared for the generic unit.

1.3. EXTERNAL_NAME Pragma

The EXTERNAL_NAME pragma takes the name of a subprogram or variable defined in Ada and allows the user to specify a different external name that may be used to reference the entity from other languages. The pragma is allowed at the place of a declarative item in a package specification and must apply to an object declared earlier in the same package specification.

1.4. INLINE_ONLY pragma

Pragma INLINE_ONLY when used in the same way as pragma INLINE, indicates to the compiler that the subprogram must always be inlined (very important for some code procedures). This pragma also suppresses the generation of a callable version of the routine which saves code space.
APPENDIX F OF THE Ada STANDARD

1.5. INTERFACE_OBJECT Pragma

The INTERFACE_OBJECT pragma takes the name of a variable defined in another language and allows it to be referenced directly in Ada. The pragma will replace all occurrences of the variable name with an external reference to the second, link_argument. The pragma is allowed at the place of a declarative item in a package specification and must apply to an object declared earlier in the same package specification. The object must be declared as a scalar or an access type. The object cannot be any of the following:

- a loop variable,
- a constant,
- an initialized variable,
- an array, or
- a record.

1.6. IMPLICIT_CODE Pragma

Takes one of the identifiers ON or OFF as the single argument. This pragma is only allowed within the declarative part of a machine code procedure. It specifies that implicit code generated by the compiler be allowed or disallowed. A warning is issued if OFF is used and any implicit code needs to be generated. The default is ON.

1.7. NO_IMAGE pragma

Pragma NO_IMAGE suppresses the generation of the image array used for the IMAGE attribute of enumeration types. This eliminates the overhead required to store the array in the executable image.

2. Implementation of Predefined Pragmas

2.1. CONTROLLED

This pragma is recognized by the implementation but has no effect in the current release.

2.2. ELABORATE

This pragma is implemented as described in Appendix B of the Ada RM.
2.3. INLINE

This pragma is implemented as described in Appendix B of the Ada RM, with the addition that recursive calls can be expanded with the pragma up to the maximum depth of 8. Warnings are produced for too-deep nestings or for bodies that are not available for in-line expansion.

2.4. INTERFACE

This pragma supports calls to 'C' and FORTRAN functions. The Ada subprograms can be either functions or procedures. The types of parameters and the result type for functions must be scalar, access or the predefined type ADDRESS in SYSTEM. An optional third argument overrides the default link name. All parameters must have mode IN. Record and array objects can be passed by reference using the ADDRESS attribute.

2.5. LIST

This pragma is implemented as described in Appendix B of the Ada RM.

2.6. MEMORY_SIZE

This pragma is recognized by the implementation. The implementation does not allow SYSTEM to be modified by means of pragmas, the SYSTEM package must be recompiled.

2.7. OPTIMIZE

This pragma is recognized by the implementation but has no effect. Code optimization options are offered via optional arguments in compiler invocation command.

2.8. PACK

This pragma will cause the compiler to choose a non-aligned representation for composite types to minimize gaps between components.
- Components that are smaller than a STORAGE_UNIT are packed into a number of bits that is a power of two.
- Components larger than a single STORAGE_UNIT are packed to the nearest STORAGE_UNIT.
2.9. PAGE

This pragma is implemented as described in Appendix B of the Ada RM. It is also recognized by the source code formatting tool released with the compiler.

2.10. PRIORITY

This pragma is implemented as described in Appendix B of the Ada RM.

2.11. SHARED

This pragma is recognized by the implementation but has no effect in the current release.

2.12. STORAGE_UNIT

This pragma is recognized by the implementation but has no effect in the current release. The implementation does not allow SYSTEM to be modified by means of pragmas. However, the same effect can be achieved by recompiling package SYSTEM with altered values.

2.13. SUPPRESS

Pragma suppress is supported in the single parameter form. The pragma applies from the point of occurrence to the end of the innermost enclosing block. DIVISION_CHECK cannot be suppressed. The double parameter form of the pragma with the name of an object type, or subtype, is recognized, but has no effect in the current release.

2.14. SYSTEM_NAME

This pragma is recognized by the implementation but has no effect in the current release. The implementation does not allow SYSTEM to be modified by means of pragmas. However, the same effect can be achieved by recompiling package SYSTEM with altered values.

3. Implementation-Dependent Attributes

The compiler provides one implementation-defined attribute, 'REF. There are two forms of use for this attribute: X'REF and SYSTEM ADDRESS'REF (N). X'REF is used only in machine code procedures, while SYSTEM ADDRESS'REF (N) can be used anywhere to convert an integer expression to an address.
3.1. X'REF

The attribute generates a REFerence to the entity to which it is applied. In X'REF, X must be either a constant, variable, procedure, function, or label. The attribute returns a value of the type MACHINE_CODE.OPERAND and may only be used to designate an operand within a code-statement.

3.2. SYSTEM.ADDRESS'REF(N)

The effect of this attribute is similar to the effect of an UNCHECKED_CONVERSION from INTEGER to ADDRESS. However, this attribute should be used instead in the following listed circumstances, and in these circumstances, N must be static.

- in any instance where N is greater than INTEGER'LAST
- to place an object at an address in using an address clause representation specification.

4. Specification Of Package SYSTEM

package SYSTEM is

  type NAME is ( sps_unix );
  SYSTEM_NAME : constant NAME := sps_unix;
  STORAGE_UNIT : constant := 8;
  MEMORY_SIZE : constant := 16_777_216;

-- System-Dependent Named Numbers

  MIN_INT : constant := -2_147_483_648;
  MAX_INT : constant := 2_147_483_647;
  MAXDIGITS : constant := 15;
  MAX_MANTISSA : constant := 31;
  FINEDELTA : constant := 2.0**(31);
  TICK : constant := 0.01;

-- Other System-dependent Declarations

  subtype PRIORITY is INTEGER range 0 .. 99;
  MAX_REC_SIZE : integer := 64*1024;

type ADDRESS is private;

NO_ADDR : constant ADDRESS;

function PHYSICAL_ADDRESS(I: INTEGER) return ADDRESS;
function ADDR_GT(A, B: ADDRESS) return BOOLEAN;
APPENDIX F OF THE Ada STANDARD

function ADDR_LT(A, B: ADDRESS) return BOOLEAN;
function ADDR_GE(A, B: ADDRESS) return BOOLEAN;
function ADDR_LE(A, B: ADDRESS) return BOOLEAN;
function ADDR_DIFF(A, B: ADDRESS) return INTEGER;
function INCR_ADDR(A: ADDRESS; INCR: INTEGER) return ADDRESS;
function DECR_ADDR(A: ADDRESS; DECR: INTEGER) return ADDRESS;

function "">"(A, B: ADDRESS) return BOOLEAN renames ADDR_GT;
function "<"(A, B: ADDRESS) return BOOLEAN renames ADDR_LT;
function ">="(A, B: ADDRESS) return BOOLEAN renames ADDR_GE;
function "<="(A, B: ADDRESS) return BOOLEAN renames ADDR_LE;
function "-"(A, B: ADDRESS) return INTEGER renames ADDR_DIFF;
function "+"(A: ADDRESS; INCR: INTEGER) return ADDRESS
renames INCR_ADDR;
function "-"(A: ADDRESS; DECR: INTEGER) return ADDRESS
renames DECR_ADDR;

pragma inline(PHYSICAL_ADDRESS);
pragma inline(ADDR_GT);
pragma inline(ADDR_LT);
pragma inline(ADDR_GE);
pragma inline(ADDR_LE);
pragma inline(ADDR_DIFF);
pragma inline(INCR_ADDR);
pragma inline(DECR_ADDR);

private

    type ADDRESS is new integer;

    NO_ADDR : constant ADDRESS := 0;

end SYSTEM;

5. Representation Specifications

5.1. Pragma PACK

Array and record components that are smaller than a STORAGE_UNIT are packed into a number of bits that is a power of two. Objects and larger components are packed to the nearest whole STORAGE_UNIT.

5.2. Length clauses

All length clauses are supported.

5.3. Enumeration representation clauses

Enumeration representation clauses are supported.
5.4. Record Representation Clauses

The only restrictions on record representation specifications are the following:

- if a component does not start and end on a storage unit boundary, it must be possible to get it into a register with one move instruction.

- a component that is itself a record must occupy a power of 2 bits. Components that are of a discrete type or packed array can occupy an arbitrary number of bits, subject to the above restrictions.

5.5. Change of representation

Change of representation is supported.

5.6. Address Clauses

Address clauses are supported for objects and entries. Interrupt entries are specified with the number of the UNIX signal. See below.

5.7. Interrupts

Interrupt entries are supported for UNIX signals. The Ada for clause gives the UNIX signal number.

5.8. Representation Attributes

The ADDRESS attribute is supported for the following entities:

Variables
Constants
Subprograms

The ADDRESS attribute is not supported for the following entities:

Packages
Tasks
Labels
Entries
5.9. Machine Code Insertions

Machine code insertions are supported.

The general definition of the package MACHINE_CODE provides an assembly language interface for the target machine, including:

- the necessary record types needed in the code statement,
- an enumeration type of all the opcode mnemonics,
- a set of register definitions,
- and a set of addressing mode functions.

The general syntax of a machine code statement is as follows:

CODE\_n'(opcode, operand\[1, operand\[l]\]);

where \(n\) indicates the number of operands in the aggregate.

A special case arises for a variable number of operands. The operands are listed within a subaggregate. The format is as follows:

CODE\_N'(opcode, (operand\[1, operand\[l]\]);

For those opcodes that require no operands, named notation must be used (cf. RM 4.3(4)).

CODE\_O'(op \rightarrow opcode);

The opcode must be an enumeration literal (i.e. it cannot be an object, attribute, or a rename).

An operand can only be an entity defined in MACHINE_CODE or the 'REF attribute.

The arguments to any of the functions defined in MACHINE_CODE must be static expressions, string literals, or the functions defined in MACHINE_CODE.

Inline expansion of machine code procedures is supported.

6. Restrictions on Unchecked Conversions

None.

7. Restrictions on Unchecked Deallocations

None.
8. Implementation Characteristics of I/O Packages

Instantiations of DIRECT_IO use the value MAX_REC_SIZE as the record size (expressed in STORAGE_UNITS) when the size of ELEMENT_TYPE exceeds that value. For example for unconstrained arrays such as string where ELEMENT_TYPE'SIZE is very large, MAX_REC_SIZE is used instead. MAX_RECORD_SIZE is defined in SYSTEM and can be changed by a program before instantiating DIRECT_IO to provide an upper limit on the record size. In any case the maximum size supported is 1024 x 1024 x STORAGE_UNIT bits. DIRECT_IO will raise USE_ERROR if MAX_REC_SIZE exceeds this absolute limit.

Instantiations of SEQUENTIAL_IO use the value MAX_REC_SIZE as the record size (expressed in STORAGE_UNITS) when the size of ELEMENT_TYPE exceeds that value. For example for unconstrained arrays such as string where ELEMENT_TYPE'SIZE is very large, MAX_REC_SIZE is used instead. MAX_RECORD_SIZE is defined in SYSTEM and can be changed by a program before instantiating INTEGER_IO to provide an upper limit on the record size. SEQUENTIAL_IO imposes no limit on MAX_REC_SIZE.

9. Implementation Limits

The following limits are actually enforced by the implementation. It is not intended to imply that resources up to or even near these limits are available to every program.

10.1. Source file limits

- 499 characters per source line
- 499 characters in identifiers and literals
- 1296 Ada units per source file
- 32767 lines per source file

10.2. Record and Array Sizes

The maximum size of a statically sized record type is 4,000,000 x STORAGE_UNITS. A record type or array type declaration that exceeds these limits will generate a warning message.

10.3. Default Stack Size for Tasks

In the absence of an explicit STORAGE_SIZE length specification every task except the main program is allocated a fixed size stack of 10,240 STORAGE_UNITS. This is the value returned by T'STORAGE_SIZE for a task type T.
10.4. Default Collection Size

In the absence of an explicit STORAGE_SIZE length attribute the default collection size for an access type is 100,000 STORAGE_UNITS. This is the value returned by T' STORAGE_SIZE for an access type T.
Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below.

<table>
<thead>
<tr>
<th>Name and Meaning</th>
<th>Value</th>

</table>
APPENDIX D

WITHDRAWN TESTS

Some tests are withdrawn from the ACVC because they do not conform to the ADA Standard. The following 27 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form "AI-ddddd" is to an Ada Commentary.

B28003A: A basic declaration (line 36) wrongly follows a later declaration.

E28005C: This test requires that 'PRAGMA LIST (ON);' not appear in a listing that has been suspended by a previous "pragma LIST (OFF);"; the Ada Standard is not clear on this point, and the matter will be reviewed by the ALMP.

C34004A: The expression in line 168 wrongly yields a value outside of the range of the target type T, raising CONSTRAINT_ERROR.

C35502P: Equality operators in lines 62 & 69 should be inequality operators.

A35902C: Line 17's assignment of the nominal upper bound of a fixed-point type to an object of that type raises CONSTRAINT_ERROR, for that value lies outside of the actual range of the type.

C35904A: The elaboration of the fixed-point subtype on line 28 wrongly raises CONSTRAINT_ERROR, because its upper bound exceeds that of the type.

C35904B: The subtype declaration that is expected to raise CONSTRAINT_ERROR when its compatibility is checked against that of various types passed as actual generic parameters, may in fact raise NUMERIC_ERROR or CONSTRAINT_ERROR for reasons not anticipated by the test.

C35A03E & R: These tests assume that attribute 'MANTISSA returns 0 when applied to a fixed-point type with a null range, but the Ada Standard doesn't support this assumption.
C37213H: The subtype declaration of SCONS in line 100 is wrongly expected to raise an exception when elaborated.

C37213J: The aggregate in line 451 wrongly raises CONSTRAINT_ERROR.

C37215C, E, G, H: Various discriminant constraints are wrongly expected to be incompatible with type CONS.

C38102C: The fixed-point conversion on line 23 wrongly raises CONSTRAINT_ERROR.

C41402A: 'STORAGE_SIZE is wrongly applied to an object of an access type.

C45332A: The test expects that either an expression in line 52 will raise an exception or else MACHINE_OVERFLOW is FALSE. However, an implementation may evaluate the expression correctly using a type with a wider range than the base type of the operands, and MACHINE_OVERFLOW may still be TRUE.

C45614C: REPORT.INDENT_INT has an argument of the wrong type (LONG_INTEGER).

A74106C, C85018B, C87B04B, CC1311B: A bound specified in a fixed-point subtype declaration lies outside of that calculated for the base type, raising CONSTRAINT_ERROR. Errors of this sort occur re lines 37 & 59, 142 & 143, 16 & 48, and 252 & 253 of the four tests, respectively (and possibly elsewhere).

BC3105A: Lines 159..168 are wrongly expected to be incorrect; they are correct.

AD1A01A: The declaration of subtype INT3 raises CONSTRAINT_ERROR for implementations that select INT'SIZE to be 16 or greater.

CE2401H: The record aggregates in lines 105 & 117 contain the wrong values.

CE3208A: This test expects that an attempt to open the default output file (after it was closed) with mode IN_FILE raises NAME_ERROR or USE_ERROR; by Commentary AI-00048. MODE_ERROR should be raised.
