CHAPTER 1

INTRODUCTION

This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies—for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report.

The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation-dependent but is permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution.
INTRODUCTION

1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:

- To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard
- To attempt to identify any language constructs not supported by the compiler but required by the Ada Standard
- To determine that the implementation-dependent behavior is allowed by the Ada Standard

Testing of this compiler was conducted by SofTech, Inc. under the direction of the AVF according to procedures established by the Ada Joint Program Office and administered by the Ada Validation Organization (AVO). On-site testing was completed 20 April 1989 at San Diego CA.

1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C.#552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

Ada Information Clearinghouse
Ada Joint Program Office
OUSDRE
The Pentagon, Rm 3D-139 (Fern Street)
Washington DC 20301-3081

or from:

Ada Validation Facility
ASD/SCEL
Wright-Patterson AFB OH 45433-6503
Questions regarding this report or the validation test results should be directed to the AVF listed above or to:

1.3 REFERENCES

1.4 DEFINITION OF TERMS

ACVC The Ada Compiler Validation Capability. The set of Ada programs that tests the conformity of an Ada compiler to the Ada programming language.

Ada Commentary An Ada Commentary contains all information relevant to the point addressed by a comment on the Ada Standard. These comments are given a unique identification number having the form AI-dddd.

Applicant The agency requesting validation.

AVF The Ada Validation Facility. The AVF is responsible for conducting compiler validations according to procedures contained in the Ada Compiler Validation Procedures and Guidelines.

AVO The Ada Validation Organization. The AVO has oversight authority over all AVF practices for the purpose of maintaining a uniform process for validation of Ada compilers. The AVO provides administrative and technical support for Ada validations to ensure consistent practices.

Compiler A processor for the Ada language. In the context of this report, a compiler is any language processor, including
INTRODUCTION

cross-compilers, translators, and interpreters.

Failed test An ACVC test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.

Host The computer on which the compiler resides.

Inapplicable test An ACVC test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.

Passed test An ACVC test for which a compiler generates the expected result.

Target The computer for which a compiler generates code.

Test A program that checks a compiler's conformity regarding a particular feature or a combination of features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files.

Withdrawn test An ACVC test found to be incorrect and not used to check conformity to the Ada Standard. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.

1.5 ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable, and special program units are used to report their results during execution. Class B tests are expected to produce compilation errors. Class L tests are expected to produce compilation or link errors because of the way in which a program library is used at link time.

Class A tests ensure the successful compilation of legal Ada programs with certain language constructs which cannot be verified at compile time. There are no explicit program components in a Class A test to check semantics. For example, a Class A test checks that reserved words of another language (other than those already reserved in the Ada language) are not treated as reserved words by an Ada compiler. A Class A test is passed if no errors are detected at compile time and the program executes to produce a PASSED message.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that every syntax or semantic error in the test is detected. A Class B test is passed if every
illegal construct that it contains is detected by the compiler.

Class C tests check the run time system to ensure that legal Ada programs can be correctly compiled and executed. Each Class C test is self-checking and produces a PASSED, FAILED, or NOT APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of a compiler. Since there are no capacity requirements placed on a compiler by the Ada Standard for some parameters—for example, the number of identifiers permitted in a compilation or the number of units in a library—a compiler may refuse to compile a Class D test and still be a conforming compiler. Therefore, if a Class D test fails to compile because the capacity of the compiler is exceeded, the test is classified as inapplicable. If a Class D test compiles successfully, it is self-checking and produces a PASSED or FAILED message during execution.

Class E tests are expected to execute successfully and check implementation-dependent options and resolutions of ambiguities in the Ada Standard. Each Class E test is self-checking and produces a NOT APPLICABLE, PASSED, or FAILED message when it is compiled and executed. However, the Ada Standard permits an implementation to reject programs containing some features addressed by Class E tests during compilation. Therefore, a Class E test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time—that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated. In some cases, an implementation may legitimately detect errors during compilation of the test.

Two library units, the package REPORT and the procedure CHECK FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED, or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK FILE is used to check the contents of text files written by some of the Class C tests for chapter 14 of the Ada Standard. The operation of REPORT and CHECK FILE is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.

The text of each test in the ACVC follows conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and place features that may not be supported by all implementations in separate
INTRODUCTION

tests. However, some tests contain values that require the test to be customized according to implementation-specific values—for example, an illegal file name. A list of the values used for this validation is provided in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. The applicability of a test to an implementation is considered each time the implementation is validated. A test that is inapplicable for one validation is not necessarily inapplicable for a subsequent validation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing a compiler. The tests withdrawn at the time of this validation are given in Appendix D.
CHAPTER 2
CONFIGURATION INFORMATION

2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: IBM Development System for the Ada Language, AIX/RT Ada Compiler, Version 1.1.1
ACVC Version: 1.10
Certificate Number: 890420W1.10066

Host Computer:

- Machine: IBM RT PC 6150-125
- Operating System: AIX
- Release 2.2
- Memory Size: 10 Megabytes

Target Computer:

- Machine: IBM RT PC 6150-125
- Operating System: AIX
- Release 2.2
- Memory Size: 10 Megabytes
CONFIGURATION INFORMATION

2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. The tests demonstrate the following characteristics:

a. Capacities.

(1) The compiler correctly processes a compilation containing 723 variables in the same declarative part. (See test D29002K.)

(2) The compiler correctly processes tests containing loop statements nested to 65 levels. (See tests D55A03A..H (8 tests).)

(3) The compiler correctly processes tests containing block statements nested to 65 levels. (See test D56001B.)

(4) The compiler correctly processes tests containing recursive procedures separately compiled as subunits nested to six levels. (See tests D64005E..G (3 tests).)

b. Predefined types.

(1) This implementation supports the additional predefined type LONG INTEGER in package STANDARD. (See tests B86001T..Z (7 tests).)

c. Expression evaluation.

The order in which expressions are evaluated and the time at which constraints are checked are not defined by the language. While the ACVC tests do not specifically attempt to determine the order of evaluation of expressions, test results indicate the following:

(1) Some of the default initialization expressions for record components are evaluated before any value is checked for membership in a component's subtype. (See test C32117A.)

(2) Assignments to subtypes are performed with the same precision as the base type. (See test C35712B.)

(3) This implementation uses no extra bits for extra precision and uses no extra bits for extra range. (See test C35903A.)
(4) Sometimes NUMERIC_ERROR is raised when an integer literal operand in a comparison or membership test is outside the range of the base type. (See test C45232A.)

(5) Sometimes NUMERIC_ERROR is raised when a literal operand in a fixed-point comparison or membership test is outside the range of the base type. (See test C45252A.)

(6) Underflow is gradual. (See tests C45524A..Z.)

d. Rounding.

The method by which values are rounded in type conversions is not defined by the language. While the ACVC tests do not specifically attempt to determine the method of rounding, the test results indicate the following:

(1) The method used for rounding to integer is round to even. (See tests C46012A..Z.)

(2) The method used for rounding to longest integer is round to even. (See tests C46012A..Z.)

(3) The method used for rounding to integer in static universal real expressions is round away from zero. (See test C4A014A.)

e. Array types.

An implementation is allowed to raise NUMERIC_ERROR or CONSTRAINT_ERROR for an array having a 'LENGTH that exceeds STANDARD.INTEGER'LAST and/or SYSTEM.MAX_INT.

For this implementation:

(1) Declaration of an array type or subtype declaration with more than SYSTEM.MAX_INT components raises NUMERIC_ERROR sometimes. (See test C36003A.)

(2) NUMERIC_ERROR is raised when a null array type with INTEGER'LAST + 2 components is declared. (See test C36202A.)

(3) NUMERIC_ERROR is raised when a null array type with SYSTEM.MAX_INT + 2 components is declared. (See test C36202B.)

(4) A packed BOOLEAN array having a 'LENGTH exceeding INTEGER'LAST raises no exception. (See test C52103X.)
CONFIGURATION INFORMATION

(5) A packed two-dimensional BOOLEAN array with more than INTEGER'LAST components raises CONSTRAINT_ERROR when the length of a dimension is calculated and exceeds INTEGER'LAST. (See test C52104Y.)

(6) A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC_ERROR or CONSTRAINT_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises no exception. (See test E52103Y.)

(7) In assigning one-dimensional array types, the expression is evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

(8) In assigning two-dimensional array types, the expression is not evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

f. Discriminated types.

(1) In assigning record types with discriminants, the expression is evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

g. Aggregates.

(1) In the evaluation of a multi-dimensional aggregate, index subtype checks are made as choices are evaluated. (See tests C43207A and C43207B.)

(2) In the evaluation of an aggregate containing subaggregates, not all choices are evaluated before being checked for identical bounds. (See test E43212B.)

(3) CONSTRAINT_ERROR is raised after all choices are evaluated when a bound in a non-null range of a non-null aggregate does not belong to an index subtype. (See test E43211B.)

h. Pragmas.

(1) The pragma INLINE is not supported for functions or procedures. (See tests LA3004A..B, EA3004C..D, and CA3004E..F.)
i. Generics

(1) Generic library subprogram specifications and bodies can be compiled in separate compilations. (See test CA1012A.)

(2) Generic non-library subprogram bodies cannot be compiled in separate compilations from their stubs. (See test CA2009F.)

(3) Generic library package specifications and bodies cannot be compiled in separate compilations. (See tests BC3204C and BC3205D.)

(4) Generic non-library package bodies as subunits cannot be compiled in separate compilations. (See test CA2009C.)

(5) Generic unit bodies and their subunits can be compiled in separate compilations. (See test CA3011A.)

j. Input and output

(1) The package SEQUENTIAL IO cannot be instantiated with unconstrained array types or record types with discriminants without defaults. (See tests AE2101C, EE2201D, and EE2201E.)

(2) The package DIRECT IO cannot be instantiated with unconstrained array types or record types with discriminants without defaults. (See tests AE2101H, EE2401D, and EE2401G.)

(3) Modes IN FILE and OUT FILE are supported for SEQUENTIAL IO. (See tests CE2102D..E, CE2102N, and CE2102P.)

(4) Modes IN_FILE, OUT_FILE, and INOUT_FILE are supported for DIRECT IO. (See tests CE2102F, CE2102I..J, CE2102R, CE2102T, and CE2102V.)

(5) Modes IN FILE and OUT FILE are supported for text files. (See tests CE3102E and CE3102I..K.)

(6) RESET and DELETE operations are supported for SEQUENTIAL IO. (See tests CE2102G and CE2102X.)

(7) RESET and DELETE operations are supported for DIRECT IO. (See tests CE2102K and CE2102Y.)

(8) RESET and DELETE operations are supported for text files. (See tests CE3102G..G, CE3104C, CE3110A, and CE3114A.)

(9) Overwriting to a sequential file does not truncate the file. (See test CE2208G.)
CONFIGURATION INFORMATION

(10) Temporary sequential files are given names and deleted when closed. (See test CE2108A.)

(11) Temporary direct files are given names and deleted when closed. (See test CE2108C.)

(12) Temporary text files are given names and deleted when closed. (See test CE3112A.)

(13) More than one internal file can be associated with each external file for sequential files when writing or reading. (See tests CE2107A..E, CE2102L, CE2110B, and CE2111D.)

(14) More than one internal file can be associated with each external file for direct files when writing or reading. (See tests CE2107F..H (3 tests), CE2110D, and CE2111H.)

(15) More than one internal file can be associated with each external file for text files when writing or reading. (See tests CE3111A..E, CE3114B, and CE3115A.)
3.1 TEST RESULTS

Version 1.10 of the ACVC comprises 3717 tests. When this compiler was tested, 43 tests had been withdrawn because of test errors. The AVF determined that 432 tests were inapplicable to this implementation. All inapplicable tests were processed during validation testing except for 327 executable tests that use floating-point precision exceeding that supported by the implementation. Modifications to the code, processing, or grading for 7 tests were required to successfully demonstrate the test objective. (See section 3.6.)

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

3.4 WITHDRAWN TESTS

The following 43 tests were withdrawn from ACVC Version 1.10 at the time of this validation:

- E28005C
- CD2A63B
- CD2A66D
- CD2A76B
- CD2A84N
- ED7005C
- CD7204B
- CE3411B
- A39005C
- CD2A63C
- CD2A63D
- CD2A73A
- CD2A76C
- CD2B15C
- CD7205C
- B97102E
- CD2A66A
- CD2A73B
- CD2A76D
- CD5007B
- CD7205D
- CE2107I
- CD2A62D
- CD2A66B
- CD2A73C
- CD2A81G
- CD5007B
- CD7205D
- CE3111C
- CD2A63A
- CD2A66C
- CD2A76A
- CD2A83G
- CD50110
- CD7105A
- CE3301A
- CD2A84M
- CD7203B
- CE3301A
- CD7203B
- CD50110
- CD7105A
- CE3301A

See Appendix D for the reason that each of these tests was withdrawn.

3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. The applicability of a test to an implementation is considered each time a validation is attempted. A test that is inapplicable for one validation attempt is not necessarily inapplicable for a subsequent attempt. For this validation attempt, 432 tests were inapplicable for the reasons indicated:

a. The following 327 tests are not applicable because they have floating-point type declarations requiring more digits than SYSTEM.MAX_DIGITS:

- C24113C..Y
- C35705C..Y
- C35706C..Y
- C35707C..Y
- C35708C..Y
- C35802C..Z
- C45241C..Y
- C45321C..Y
- C45421C..Y
- C45521C..Z
- C45524C..Z
- C45621C..Z
- C46012C..Z

3-2
b. C35508I, C35508J, C35508M, and C35508N are not applicable because they include enumeration representation clauses for BOOLEAN types in which the representation values are other than (FALSE = 0, TRUE = 1). Under the terms of AI-00325, this implementation is not required to support such representation clauses.

c. C35702A and B86001T are not applicable because this implementation supports no predefined type SHORT_FLOAT.

d. C35702B and B86001U are not applicable because this implementation supports no predefined type LONG_FLOAT.

e. The following 16 tests are not applicable because this implementation does not support a predefined type SHORT_INTEGER:

   C45231B  C45304B  C45502B  C45503B  C45504B  
   C45504E  C45611B  C45613B  C45614B  C45631B  
   C45632B  B52004E  C55B07B  B55B09D  B86001V  
   CD7101E

f. C45231D, B86001X, and CD7101G are not applicable because this implementation does not support any predefined integer type with a name other than INTEGER, LONG_INTEGER, or SHORT_INTEGER.

g. C45531M..P (4 tests) and C45532M..P (4 tests) are not applicable because the value of SYSTEM.MAX_MANTISSA is less than 47.

h. D64005F and D64005G are not applicable because this implementation does not support nesting 10 levels of recursive procedure calls.

i. C86001F is not applicable because, for this implementation, the package TEXT_IO is dependent upon package SYSTEM. These tests recompile package SYSTEM, making package TEXT_IO, and hence package REPORT, obsolete.

j. B86001Y is not applicable because this implementation supports no predefined fixed-point type other than DURATION.

k. B86001Z is not applicable because this implementation supports no predefined floating-point type with a name other than FLOAT, LONG_FLOAT, or SHORT_FLOAT.

l. CA2009C, CA2009F, BC3204C, and BC3205D instantiate generic units in compilation units whose bodies are compiled after the instantiation, or are recompiled after compilation of the instantiating unit. This implementation creates an allowable dependency on the body of the generic unit, and thus rejects the program at bind time.

m. LA3004A, LA3004B, EA3004C, EA3004D, CA3004E, and CA3004F are not applicable because this implementation does not support pragma INLINE.

n. CD1009C, CD2A41A..B (2 tests), CD2A41E, and CD2A42A..J (10 tests) are not applicable because this implementation does not support size
clauses for floating point types.

o. CD2A61I and CD2A61J are not applicable because this implementation does not support size clauses for array types, which imply compression, with component types of composite or floating point types. This implementation requires an explicit size clause on the component type.

p. CD2A84B..I (8 tests) and CD2A84K..L (2 tests) are not applicable because this implementation does not support size clauses for access types.

q. AE2101C, EE2201D, and EE2201E use instantiations of package SEQUENTIAL IO with unconstrained array types and record types with discriminants without defaults. These instantiations are rejected by this compiler.

r. AE2101H, EE2401D, and EE2401G use instantiations of package DIRECT IO with unconstrained array types and record types with discriminants without defaults. These instantiations are rejected by this compiler.

s. CE2102D is inapplicable because this implementation supports CREATE with IN_FILE mode for SEQUENTIAL IO.

t. CE2102E is inapplicable because this implementation supports CREATE with OUT_FILE mode for SEQUENTIAL IO.

u. CE2102F is inapplicable because this implementation supports CREATE with INOUT_FILE mode for DIRECT IO.

v. CE2102I is inapplicable because this implementation supports CREATE with IN_FILE mode for DIRECT IO.

w. CE2102J is inapplicable because this implementation supports CREATE with OUT_FILE mode for DIRECT IO.

x. CE2102N is inapplicable because this implementation supports OPEN with IN_FILE mode for SEQUENTIAL IO.

y. CE2102O is inapplicable because this implementation supports RESET with IN_FILE mode for SEQUENTIAL IO.

z. CE2102P is inapplicable because this implementation supports OPEN with OUT_FILE mode for SEQUENTIAL IO.

aa. CE2102Q is inapplicable because this implementation supports RESET with OUT_FILE mode for SEQUENTIAL IO.

ab. CE2102R is inapplicable because this implementation supports OPEN with INOUT_FILE mode for DIRECT IO.

ac. CE2102S is inapplicable because this implementation supports RESET with INOUT_FILE mode for DIRECT IO.
ad. CE2102T is inapplicable because this implementation supports OPEN with IN_FILE mode for DIRECT_IO.

ae. CE2102U is inapplicable because this implementation supports RESET with IN_FILE mode for DIRECT_IO.

af. CE2102V is inapplicable because this implementation supports open with OUT_FILE mode for DIRECT_IO.

ag. CE2102W is inapplicable because this implementation supports RESET with OUT_FILE mode for DIRECT_IO.

ah. CE2201G is inapplicable because this implementation does not support CREATE with OUT_FILE mode for SEQUENTIAL_IO.

ai. CE2401H is inapplicable because this implementation does not support CREATE with INOUT_FILE mode for unconstrained records with default discriminants.

aj. CE3102E is inapplicable because this implementation supports CREATE with IN_FILE mode for text files.

ak. CE3102F is inapplicable because this implementation supports RESET for text files.

al. CE3102G is inapplicable because this implementation supports deletion of an external file for text files.

am. CE3102I is inapplicable because this implementation supports CREATE with OUT_FILE mode for text files.

an. CE3102J is inapplicable because this implementation supports OPEN with IN_FILE mode for text files.

ao. CE3102K is inapplicable because this implementation supports OPEN with OUT_FILE mode for text files.

3.6 TEST, PROCESSING, AND EVALUATION MODIFICATIONS

It is expected that some tests will require modifications of code, processing, or evaluation in order to compensate for legitimate implementation behavior. Modifications are made by the AVF in cases where legitimate implementation behavior prevents the successful completion of an (otherwise) applicable test. Examples of such modifications include: adding a length clause to alter the default size of a collection; splitting a Class B test into subtests so that all errors are detected; and confirming that messages produced by an executable test demonstrate conforming behavior that wasn’t anticipated by the test (such as raising one exception instead of another).

Modifications were required for 7 tests.
The following tests were split because syntax errors at one point resulted in the compiler not detecting other errors in the test:

BA1101C  BA3006A  BA3006B  BA3007B  BA3008A  BA3008E
BA3013A

3.7 ADDITIONAL TESTING INFORMATION

3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.10 produced by the IBM Development System for the Ada Language, AIX/RT Ada Compiler was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and the compiler exhibited the expected behavior on all inapplicable tests.

3.7.2 Test Method

Testing of the IBM Development System for the Ada Language, AIX/RT Ada Compiler using ACVC Version 1.10 was conducted on-site by a validation team from the AVF. The configuration in which the testing was performed is described by the following designations of hardware and software components:

<table>
<thead>
<tr>
<th>Host computer:</th>
<th>IBM RT PC 6150-125</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host operating system:</td>
<td>AIX, Release 2.2</td>
</tr>
<tr>
<td>Target computer:</td>
<td>IBM RT PC 6150-125</td>
</tr>
<tr>
<td>Target operating system:</td>
<td>AIX, Release 2.2</td>
</tr>
<tr>
<td>Compiler:</td>
<td>IBM Development System for the Ada Language, AIX/RT Ada Compiler, Version 1.1.1</td>
</tr>
</tbody>
</table>

A magnetic tape, TAR format, containing all tests except for withdrawn tests and tests requiring unsupported floating-point precisions was taken on-site by the validation team for processing. Tests that make use of use of implementation-specific values were customized before being written to the magnetic tape. Tests requiring modifications during the prevalidation testing were included in their modified form on the magnetic tape.

The contents of the magnetic tape were not loaded directly onto the host computer. It was loaded onto a SUN 3 computer and from the files loaded onto the SUN 3, a tape cartridge compatible with the host computer was made. This cartridge was then loaded onto RT PC 6150-125.

After the test files were loaded to disk, the full set of tests was compiled, linked, and all executable tests were run on the IBM RT PC 6150-125. Results were printed from an IBM 3083 with the results being transferred to the IBM 3083 via the IBM RT PC 3278/3279 emulation package.

3-6
The compiler was tested using command scripts provided by International Business Machines Corporation and reviewed by the validation team. The compiler was tested using the following default option settings:

<table>
<thead>
<tr>
<th>OPTION</th>
<th>EFFECT</th>
</tr>
</thead>
<tbody>
<tr>
<td>+target</td>
<td>Adds target debug information to generated code.</td>
</tr>
<tr>
<td>+virt=1000</td>
<td>Specifies the number of virtual pages use by VSM.</td>
</tr>
<tr>
<td>-opt</td>
<td>Sets the optimizer off.</td>
</tr>
<tr>
<td>+killbodies</td>
<td>Causes the intermediate data to be deleted from the sublibraries.</td>
</tr>
<tr>
<td>+verbose</td>
<td>Causes additional console out information such as banners and front end, middle pass, and code generator completion messages, and error counts to be generated.</td>
</tr>
</tbody>
</table>

The following option settings were used instead of the defaults:

<table>
<thead>
<tr>
<th>OPTION</th>
<th>EFFECT</th>
</tr>
</thead>
<tbody>
<tr>
<td>+bind</td>
<td>Produces an executable from previously compiled code.</td>
</tr>
<tr>
<td>+main</td>
<td>Compiles the specified file as a main program.</td>
</tr>
<tr>
<td>+list</td>
<td>Generates compilation listing.</td>
</tr>
<tr>
<td>-verbose</td>
<td>Causes additional console out information such as banners and front end, middle pass, and code generator completion messages, and error counts not to be generated.</td>
</tr>
</tbody>
</table>

Tests were compiled, linked, and executed (as appropriate) using two computers. Test output, compilation listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.

3.7.3 Test Site

Testing was conducted at San Diego CA and was completed on 20 April 1989.
International Business Machines Corporation has submitted the following Declaration of Conformance concerning the IBM Development System for the Ada Language, AIX/RT Ada Compiler.
DECLARATION OF CONFORMANCE

Compiler Implementor: TeleSoft
Ada Validation Facility: ASD/SCEL, Wright-Patterson AFB, OH 45433-6503
Ada Compiler Validation Capability (ACVC) Version: 1.10

Base Configuration

Base Compiler Name: IBM Development System for the Ada Language,
AIX/RT Ada Compiler, Version 1.1.1
Host Architecture ISA: IBM RT PC 6150-125
Operating System: AIX, Release 2.2
Target Architecture ISA: IBM RT PC 6150-125
Operating System: AIX, Release 2.2

Implementor's Declaration

I, the undersigned, representing TeleSoft have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler listed in this declaration. I declare that International Business Machines Corporation is the owner of record of the object code of the Ada language compiler listed above and, as such, is responsible for maintaining said compiler in conformance to ANSI/MIL-STD-1815A. All certificates and registrations for the Ada language compiler listed in this declaration shall be made only in the owner's corporate name.

[Signature]
TeIesoft
Raymond A. Parra, Director, Contracts & Legal

Date: May 10, 1989

Owner's Declaration

I, the undersigned, representing International Business Machines Corporation take full responsibility for implementation and maintenance of the Ada compiler listed above, and agree to the public disclosure of the final Validation Summary Report. I declare that all of the Ada language compilers listed, and their host/target performance are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A.

[Signature]

S. W. Poiacek, Manager of Advanced Language Products

Date: May 15, 1989

A-2
APPENDIX B
APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the IBM Development System for the Ada Language, AIX/RT Ada Compiler, Version 1.1.1, as described in this Appendix, are provided by TeleSoft. Unless specifically noted otherwise, references in this Appendix are to compiler documentation and not to this report. Implementation-specific portions of the package STANDARD, which are not a part of Appendix F, are:

package STANDARD is

...  

  type INTEGER is range -32768 .. 32767;
  type LONG_INTEGER is range -2147483648 .. 2147483647;

  type FLOAT is digits 6 range -1.70141E+38 .. 1.70141E+38;
  type DURATION is delta 2**(-14) range -86400.0 .. 86400.0;

...  

end STANDARD;
APPENDIX F
OF THE LANGUAGE REFERENCE MANUAL

The Ada language definition allows for certain target dependencies in a controlled manner. This section, called Appendix F as prescribed in the LRM, describes implementation-dependent characteristics of the IBM Ada Development System AIX/RT Compiler Version 2.1 running under AIX 2.2.

1. Implementation-Defined Pragmas
   Implementation dependent pragmas are:
   - PRAGMA COMMENT (string literal);
     embeds string literal into object code
   - PRAGMA IMAGES (enumeration_type, <immediate> <deferred>);
     generates a table of images for the enumeration type
     'deferred' causes the table to be generated only if
     the enumeration type is used in a compilation unit

2. Predefined Pragmas
   Supported pragmas are INTERFACE, ELABORATE, SUPPRESS, PACK, PAGE, LIST, and PRIORITY.
   All pragmas have conventional meanings except LIST which suppresses listings prior to Pragma LIST(ON) regardless of the user request. Pragma INTERFACE supports C, Fortran and Assembly.
   Unrecognized and unsupported Pragmas are ignored with the appropriate warning message.

3. Representation Clauses
   Supported representation clauses include:
   - Length Clause
   - Enumeration Representation Clauses, except for Boolean types
   - Record Representation Clause
   - Address Clause for variables, constants, and tasks
   - Interrupt support
   Record representation clauses are aligned on 16-bit boundaries.

4. Restrictions on Unchecked Conversion
   The only restriction on Unchecked Conversion is that the two types (or subtypes) A and B must be the same static size, and that neither A nor B are private.
5. Package SYSTEM

The package System has the following characteristics:

PACKAGE System IS

-- for integer use 16;

TYPE Address is access integer;
-- for Address's size use 4*Storage_Unit;

TYPE Subprogram_Value is
  Record
    KR : Address;
    Static_Base : Address;
  End Record;

TYPE Name IS (TeleSoft_Ada);

System_Name : CONSTANT name := TeleSoft_Ada;

Storage_Unit : CONSTANT := 8;

Memory_Size : CONSTANT := 1024*16416;

-- System-Dependent Named Numbers:

Min_Int : CONSTANT := -(2 ** 31);
Max_Int : CONSTANT := (2 ** 31) - 1;
Max_Digits : CONSTANT := 6;
Max_Mantissa : CONSTANT := 31;
Fine_Delta : CONSTANT := 1.0 / (2 ** Max_Mantissa);
Tick : CONSTANT := 0.1

-- Other System-Dependent Declarations

SUBTYPE Priority IS Integer RANGE 0 .. 255;

Max_Object_Size : CONSTANT := (32*1024)-1;
Max_Record_Count : CONSTANT := (32*1024)-1;
Max_Text_IO_Count : CONSTANT := 16*1024;
Max_Text_IO_Field : CONSTANT := 1000;

end System;

6. Representation Attributes

All defined representation Attributes shall be supported.
7. Implementation-Generated Names

There are no implementation-generated names denoting implementation-dependent components. Names generated by the compiler shall not interfere with programmer-defined names.

8. Implementation-Dependent Characteristics of the I/O Packages

- Sequential_IO, Direct_IO, and Text_IO are supported.
- Low_Level_IO is not supported.
- Unconstrained array types and unconstrained types with discriminants may not be instantiated for I/O.
- File names follow the conventions and restrictions of the target operating system, except that non-printing characters, blank(' ') and asterisk ('*') are disallowed.
- In Text_IO, the type Field is defined as follows: subtype Field is integer range 0..1000;
- In Text_IO, the type Count is defined as follows: type Count is range 0..16_384;

9. Predefined Numeric Types

The current specification of package STANDARD includes:

type INTEGER is range -32768 .. 32767;

type LONG_INTEGER is range -2147483648 .. 2147483647;

type FLOAT is digits 6 range -1.70141E+38 .. 1.70141E+38;

type DURATION is delta 2 ** (-14) range -86400.0 .. 86400.0;

INTEGER
'First = -32768
'Last = 32767
'Size = 16

LONG_INTEGER
'First = -2147483648
'Last = 2147483647
'Size = 32

FLOAT
'Machine_Overflows = true
'Machine_Rounds = true
'Machine_Radix = 2
'Machine_Mantissa = 23
'Machine_Emax = 127
'Machine_Emin = -128
'Mantissa = 21
'Digits = 6
'Size = 32
'Emax = 84
'Safe_Emax = 126
'Epsilon = 9.53674E-07
'Safe_Large = 8.50706E-37
'Safe_Small = 2.93873E-39

DURATION
'Machine_Overflows = false
'Machine_Rounds = false
'Delta = 2**(-14)
'First = -86400.0
'Last = 86400.0

10. Restrictions on Machine Code Insertions

Machine code insertions are not supported.
Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below:

<table>
<thead>
<tr>
<th>Name and Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ACC SIZE</td>
<td>32</td>
</tr>
<tr>
<td>An integer literal whose value is the number of bits sufficient to hold any value of an access type.</td>
<td></td>
</tr>
<tr>
<td>$BIG ID1</td>
<td>(1..199 ≡ 'A', 200 ≡ '1')</td>
</tr>
<tr>
<td>An identifier the size of the maximum input line length which is identical to $BIG ID2 except for the last character.</td>
<td></td>
</tr>
<tr>
<td>$BIG ID2</td>
<td>(1..199 ≡ 'A', 200 ≡ '2')</td>
</tr>
<tr>
<td>An identifier the size of the maximum input line length which is identical to $BIG ID1 except for the last character.</td>
<td></td>
</tr>
<tr>
<td>$BIG ID3</td>
<td>(1..100 ≡ 'A', 101 ≡ '3', 102..200 ≡ 'A')</td>
</tr>
<tr>
<td>An identifier the size of the maximum input line length which is identical to $BIG ID4 except for a character near the middle.</td>
<td></td>
</tr>
</tbody>
</table>
### TEST PARAMETERS

<table>
<thead>
<tr>
<th>Name and Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SBIG ID4</strong></td>
<td>An identifier the size of the maximum input line length which is identical to SBIG ID3 except for a character near the middle.</td>

APPENDIX D
WITHDRAWN TESTS

Some tests are withdrawn from the ACVC because they do not conform to the Ada Standard. The following 43 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form AI-ddddd is to an Ada Commentary.

a. E28005C has been withdrawn because it expects that the string "--TOP OF PAGE. --63" of line 204 will appear at the top of the listing page due to a pragma PAGE in line 203; but line 203 contains text that follows the pragma, and it is this that must appear at the top of the page.

b. A39005G has been withdrawn because it unreasonably expects a component clause to pack an array component into a minimum size (line 30).

c. B97102E has been withdrawn because it contains an unintended illegality: a select statement contains a null statement at the place of a selective wait alternative (line 31).

d. BC3009B has been withdrawn because it wrongly expects that circular instantiations will be detected in several compilation units even though none of the units is illegal with respect to the units it depends on; by AI-00256, the illegality need not be detected until execution is attempted (line 95).

e. CD2A62D has been withdrawn because it wrongly requires that an array object's size be no greater than 10, although its subtype's size was specified to be 40 (line 137).

f. CD2A63A..D, CD2A66A..D, CD2A73A..D, CD2A76A..D [16 tests] have been withdrawn because they wrongly attempt to check the size of objects of a derived type (for which a 'SIZE length clause is given) by passing them to a derived sub-program (which implicitly converts them to the parent type (Ada standard 3.4:14)). Additionally, they use the 'SIZE length clause and attribute,
WITHDRAWN TESTS

whose interpretation is considered problematic by the WG9 ARG.

g. CD2A81G, CD2A83G, CD2A84M and N, and CD50110 have been withdrawn because they assume that dependent tasks will terminate while the main program executes a loop that simply tests for task termination; this is not the case, and the main program may loop indefinitely (lines 74, 85, 86 and 96, 86 and 96, and 58, respectively).

h. CD2B15C and CD7205C have been withdrawn because they expect that a 'STORAGE_SIZE length clause provides precise control over the number of designated objects in a collection; the Ada standard 13.2:15 allows that such control must not be expected.

i. CD2D11B has been withdrawn because it gives a SMALL representation clause for a derived fixed-point type (at line 30) that defines a set of model numbers that are not necessarily represented in the parent type; by Commentary AI-00099, all model numbers of a derived fixed-point type must be representable values of the parent type.

j. CD5007B has been withdrawn because it wrongly expects an implicitly declared subprogram to be at the the address that is specified for an unrelated subprogram (line 303).

k. ED7004B, ED7005C and D, ED7006C and D [5 tests] have been withdrawn because they check various aspects of the use of the three SYSTEM pragmas; the AV0 withdraws these tests as being inappropriate for validation.

l. CD7105A has been withdrawn because it requires that successive calls to CALENDAR.CLOCK change by at least SYSTEM.TICK; however, by Commentary AI-00201, it is only the expected frequency of change that must be at least SYSTEM.TICK—particular instances of change may be less (line 29).

m. CD7203B and CD7204B have been withdrawn because they use the 'SIZE length clause and attribute, whose interpretation is considered problematic by the WG9 ARG.

n. CD7205D has been withdrawn because it checks an invalid test objective: it treats the specification of storage to be reserved for a task's activation as though it were like the specification of storage for a collection.

o. CE21071 has been withdrawn because it requires that objects of two similar scalar types be distinguished when read from a file—DATA ERROR is expected to be raised by an attempt to read one object as of the other type. However, it is not clear exactly how the Ada standard 14.2.4:4 is to be interpreted; thus, this test objective is not considered valid (line 90).
p. CE3111C has been withdrawn because it requires certain behavior when two files are associated with the same external file; however, this is not required by the Ada standard.

q. CE3301A has been withdrawn because it contains several calls to END OF LINE and END OF PAGE that have no parameter: these calls were intended to specify a file, not to refer to STANDARD INPUT (lines 103, 107, 118, 132, and 136).

r. CE3411B has been withdrawn because it requires that a text file's column number be set to COUNT'LAST in order to check that LAYOUT_ERROR is raised by a subsequent PUT operation. But the former operation will generally raise an exception due to a lack of available disk space, and the test would thus encumber validation testing.
