This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies -- for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report.

The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent, but is permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution.

1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:
INTRODUCTION

- To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard
- To attempt to identify any language constructs not supported by the compiler but required by the Ada Standard
- To determine that the implementation-dependent behavior is allowed by the Ada Standard

Testing of this compiler was conducted by The National Computing Centre according to procedures established by the Ada Joint Program Office and administered by the Ada Validation Organization (AVO). On-site testing was completed 21 March 1989 at SD-Scicon Plc, Pembroke House, Pembroke Broadway, Camberley, Surrey.

1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

   December 1986.

1.4 DEFINITION OF TERMS

ACVC The Ada Compiler Validation Capability. The set of Ada programs that tests the conformity of an Ada compiler to the Ada programming language.

Ada Commentary An Ada Commentary contains all information relevant to the point addressed by a comment on the Ada Standard. These comments are given a unique identification number having the form AI-ddddd.

Applicant The agency requesting validation.

AVF The Ada Validation Facility. The AVF is responsible for conducting compiler validations according to procedures contained in the Ada Compiler Validation Procedures and Guidelines.
INTRODUCTION

AVO  The Ada Validation Organization. The AVO has oversight authority over all AVF practices for the purpose of maintaining a uniform process for validation of Ada compilers. The AVO provides administrative and technical support for Ada validations to ensure consistent practices.

Compiler  A processor for the Ada language. In the context of this report, a compiler is any language processor, including cross-compilers, translators, and interpreters.

Failed test  An ACVC test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.

Host  The computer on which the compiler resides.

Inapplicable test  An ACVC test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.

Passed test  An ACVC test for which a compiler generates the expected result.

Target  The computer which executes the code generated by the compiler.

Test  A program that checks a compiler's conformity regarding a particular feature or a combination of features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files.

Withdrawn test  An ACVC test found to be incorrect and not used to check conformity to the Ada Standard. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.

1.5  ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into
six test classes: A, B, C, D, E and L. The first letter of a
test name identifies the class to which it belongs. Class A, C,
D and E tests are executable, and special program units are used
to report their results during execution. Class B tests are
expected to produce compilation errors. Class L tests are
expected to produce errors because of the way in which a program
library is used at link time.

Class A tests ensure the successful compilation and execution of
legal Ada programs with certain language constructs which cannot
be verified at run time. There are no explicit program
components in a Class A test to check semantics. For example,
a Class A test checks that reserved words of another language
(other than those already reserved in the Ada language) are not
treated as reserved words by an Ada compiler. A Class A test is
passed if no errors are detected at compile time and the program
executes to produce a PASSED message.

Class B tests check that a compiler detects illegal language
usage. Class B tests are not executable. Each test in this
class is compiled and the resulting compilation listing is
examined to verify that every syntax or semantic error in the
test is detected. A Class B test is passed if every illegal
construct that it contains is detected by the compiler.

Class C tests check the run time system to ensure that legal Ada
programs can be correctly compiled and executed. Each Class C
test is self-checking and produces a PASSED, FAILED, or NOT
APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of
a compiler. Since there are no capacity requirements placed on
a compiler by the Ada Standard for some parameters -- for
example, the number of identifiers permitted in a compilation or
the number of units in a library -- a compiler may refuse to
compile a Class D test and still be a conforming compiler.
Therefore, if a Class D test fails to compile because the
capacity of the compiler is exceeded, the test is classified as
inapplicable. If a Class D test compiles successfully, it is
self-checking and produces a PASSED or FAILED message during
execution.

Class E tests are expected to execute successfully and check
implementation-dependent options and resolutions of ambiguities
in the Ada Standard. Each Class E test is self-checking and
produces a NOT APPLICABLE, PASSED or FAILED message when it is
compiled and executed. However, the Ada Standard permits an
implementation to reject programs containing some features
addressed by Class E tests during compilation. Therefore, a
INTRODUCTION

Class F test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time -- that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated. In some cases, an implementation may legitimately detect errors during compilation of the test.

Two library units, the package REPORT and the procedure CHECK FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK_FILE is used to check the contents of text files written by some of the Class C tests for Chapter 14 of the Ada Standard. The operation of REPORT and CHECK_FILE is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.

The text of each test in the ACVC follows conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and place features that may not be supported by all implementations in separate tests. However, some tests contain values that require the test to be customized according to implementation-specific values -- for example, an illegal file name. A list of the values used for this validation is provided in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. The applicability of a test to an implementation is considered each time the implementation is validated. A test that is inapplicable for one validation is not necessarily inapplicable for a subsequent validation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing.
a compiler. The tests withdrawn at the time of this validation are given in Appendix D.
CHAPTER 2

CONFIGURATION INFORMATION

2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: XD Ada MC68020 T1.0-02V

ACvC Version: 1.10

Certificate Number: #890321N1.10041

Host Computer:

Machine: VAX CLUSTER comprising of a VAX 8600 and seven MicroVAX II's.

Operating System: VMS 5.0

Memory Size: 90Mb

Target Computer:

Machine: MC68020 implemented on a MVME 133 XT board (bare machine)

Memory Size: 1Mb

Communications Network: RS232 link
2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. The tests demonstrate the following characteristics:

a. Capacities.

(1) The compiler correctly processes a compilation containing 723 variables in the same declarative part. (See test D29002K.)

(2) The compiler correctly processes tests containing loop statements nested to 65 levels. (See tests D55A03A..H (6 tests).)

(3) The compiler correctly processes tests containing block statements nested to 65 levels. (See test D560013.)

(4) The compiler correctly processes tests containing recursive procedures separately compiled as subunits nested to 17 levels. (See tests D64005E..G (3 tests).)

b. Predefined types.

(1) This implementation supports the additional predefined types SHORT INTEGER, SHORT_SHORT_INTEGER, LONG_FLOAT and LONG_LONG_FLOAT in the package STANDARD. (See tests B86001T..Z (7 tests).)

c. Expression evaluation.

The order in which expressions are evaluated and the time at which constraints are checked are not defined by the language. While the ACVC tests do not specifically attempt to determine the order of evaluation of expressions, test results indicate the following:

(1) None of the default initialization expressions for record components are evaluated before any value is checked for membership in a component's subtype. (See test C32117A.)
(2) Assignments for subtypes are performed with the same precision as the base type. (See test C35712B.)

(3) This implementation uses no extra bits for extra precision and uses all extra bits for extra range. (See test C35903A.)

(4) No exception is raised when an integer literal operand in a comparison or membership test is outside the range of the base type. (See test C45232A.)

(5) No exception is raised when a literal operand in a fixed-point comparison or membership test is outside the range of the base type. (See test C45252A.)

(6) Underflow is gradual. (See tests C45524A..Z (26 tests).)

d. Rounding.

The method by which values are rounded in type conversions is not defined by the language. While the ACVC tests do not specifically attempt to determine the method of rounding, the test results indicate the following:

(1) The method used for rounding to integer is round to even. (See tests C46012A..Z (26 tests).)

(2) The method used for rounding to longest integer is round to even. (See tests C46012A..Z (26 tests).)

(3) The method used for rounding to integer in static universal real expressions is round away from zero. (See test C4A014A.)

e. Array types.

An implementation is allowed to raise NUMERIC_ERROR or CONSTRAINT_ERROR for an array having a 'LENGTH that exceeds STANDARD.INTEGER'LAST and/or SYSTEM.MAX_INT. For this implementation:

(1) Declaration of an array type or subtype declaration with more than SYSTEM.MAX_INT components raises NUMERIC_ERROR. (See test C36003A.)
(2) NUMERIC_ERROR is raised when an array type with INTEGER'LAST + 2 components is declared. (See test C36202A.)

(3) NUMERIC_ERROR is raised when an array type with SYSTEM.MAX_INT + 2 components is declared. (See test C36202B.)

(4) A packed BOOLEAN array having a 'LENGTH exceeding INTEGER'LAST raises NUMERIC_ERROR when the array type is declared. (See test C52103X.)

(5) A packed two-dimensional BOOLEAN array with more than INTEGER'LAST components raises NUMERIC_ERROR when the array type is declared. (See test C52104Y.)

(6) In assigning one-dimensional array types, the expression is evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

(7) In assigning two-dimensional array types, the expression is not evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

f. A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC_ERROR or CONSTRAINT_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises NUMERIC_ERROR when the array type is declared. (See test E52103Y.)

g. Discriminated types.

(1) In assigning record types with discriminants, the expression is evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

h. Aggregates.
(1) In the evaluation of a multi-dimensional aggregate, the test results indicate that all choices are evaluated before checking against the index type. (See tests C43207A and C43207B.)

(2) In the evaluation of an aggregate containing subaggregates, all choices are evaluated before being checked for identical bounds. (See test E43212B.)

(3) CONSTRAINT_ERROR is raised after all choices are evaluated when a bound in a non-null range of a non-null aggregate does not belong to an index subtype. (See test E43211B.)

i. Pragmas.

(1) The pragma INLINE is supported for functions or procedures. (See tests LA3004A..B (2 tests), EA3004C..D (2 tests), and CA3004E..F (2 tests).)

j. Generics.

(1) Generic specifications and bodies can be compiled in separate compilations. (See tests CA1012A, CA2009C, CA2009F, BC3204C, and BC3205D.)

(2) Generic subprogram declarations and bodies can be compiled in separate compilations. (See tests CA1012A and CA2009F.)

(3) Generic library subprogram specifications and bodies can be compiled in separate compilations. (See test CA1012A.)

(4) Generic non-library package bodies as subunits can be compiled in separate compilations. (See test CA2009C.)

(5) Generic non-library subprogram bodies can be compiled in separate compilations from their stubs. (See test CA2009F.)

(6) Generic unit bodies and their subunits can be compiled in separate compilations. (See test CA3011A.)
(7) Generic package declarations and bodies can be compiled in separate compilations. (See tests CA2009C, BC3204C, and BC3205D.)

(8) Generic library package specifications and bodies can be compiled in separate compilations. (See tests BC3204C and BC3205D.)

(9) Generic unit bodies and their subunits can be compiled in separate compilations. (See test CA3011A.)

k. Input and output.

(1) The package SEQUENTIAL_IO cannot be instantiated with unconstrained array types or record types with discriminants without defaults. (See tests AE2101C, EE2201D, and EE2201E.)

(2) The package DIRECT_IO cannot be instantiated with unconstrained array types or record types with discriminants without defaults. (See tests AE2101H, EE2401D, and EE2401G.)

(3) The director, AJPO, has determined (AI-00332) that every call to OPEN and CREATE must raise USE_ERROR or NAME_ERROR if file input/output is not supported. This implementation exhibits this behavior for SEQUENTIAL_IO, DIRECT_IO, and TEXT_IO.
CHAPTER 3

TEST INFORMATION

3.1 TEST RESULTS

Version 1.10 of the ACVC comprises 3717 tests. When this compiler was tested, 43 tests had been withdrawn because of test errors. The AVF determined that 550 tests were inapplicable to this implementation. All inapplicable tests were processed during validation testing except for 159 executable tests that use floating-point precision exceeding that supported by the implementation. Modifications to the code, processing, or grading for 12 tests were required to successfully demonstrate the test objective. (See section 3.6.)

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

Validation Summary Report
SD-Scicon plc XD Ada NC68020 11.0-02V
Chapter 3 Page 1 of 9
3.4 WITHDRAWN TESTS

The following 43 tests were withdrawn from ACVC Version 1.10 at the time of this validation:

- E28005C
- B97102E
- CD2A62D
- CD2A66A..D (4 tests)
- CD2A76A..D (4 tests)
- CD2A83G
- CD50110
- CD7205C
- CD5007B
- ED7006C..D (2 tests)
- ED7005C..D (2 tests)
- CD7105A
- CD7204B
- CE2107I
- CE3301A
- BD3009B
- CD2A63A..D (4 tests)
- CD2A73A..D (4 tests)
- CD2A81G
- CD2B15C
- CD2D11B
- ED7004B
- CD7203B
- CD7205D
- CE3111C
- CE3411B

See Appendix D for the reason that each of these tests was withdrawn.

3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. The applicability of a test to an implementation is considered each time a validation is attempted. A test that is inapplicable for one validation attempt is not necessarily inapplicable for a subsequent attempt. For this validation attempt, 550 tests were inapplicable for the reasons indicated:

a. The following 159 tests are not applicable because they have floating-point type declarations requiring more digits than SYSTEM.MAX_DIGITS:

- C241130..Y (11 tests)
- C357060..Y (11 tests)
- C357080..Y (11 tests)
- C452410..Y (11 tests)
- C454210..Y (11 tests)
- C455240..Z (12 tests)
- C456410..Y (11 tests)
- C357050..Y (11 tests)
- C357070..Y (11 tests)
- C358020..Z (12 tests)
- C453210..Y (11 tests)
- C455210..Z (12 tests)
- C456210..Z (12 tests)
- C460120..Z (12 tests)
b. The following 16 tests are not applicable because 'SMALL representation clauses are not supported.

A39005E     C87B62C
CD1009L     CD1C03F
CD2A53A..E (5 tests)     CD2A54A..B (2 tests)
CD2A54G     CD2A54I
ED2A56A     CD2D11A
CD2D13A

c. C35702A and B86001T are not applicable because this implementation supports no predefined type SHORT_FLOAT.

d. The following 16 tests are not applicable because this implementation does not support a predefined type LONG_INTEGER:

C45231C     C45304C     C45502C     C45503C     C45504C
C45504F     C45611C     C45613C     C45614C     C45631C
C45632C     B52004D     C55B07A     B55B09C     B86001W
CD7101F

e. C45531M..P (4 tests) and C45532M..P (4 tests) are all inapplicable because this implementation has a 'MAX_MANTISSA of 31 and these tests require the compiler to support a greater value.

f. C4A013B is not applicable because the evaluation of an expression involving 'MACHINE RADIX applied to the most precise floating-point type would raise an exception; since the expression must be static, it is rejected at compile time.

g. B86001Y is not applicable because this implementation supports no predefined fixed-point type other than DURATION.

h. C86001F is not applicable because package system is used by TEXT_IO.

i. C96005B is not applicable because there are no values of type DURATION'BASE that are outside the range of DURATION.

j. CD1009C, CD2A41A..E (5 tests) and CD2A42A..J (10 tests) are not applicable because 'SIZE representation clauses for floating-point types are not supported.

k. The following 25 tests are not applicable because 'SIZE representation clauses for array types are not supported.
CD1009E..F (2 tests)  CD2A61A..L (12 tests)
CD2A62A..C (3 tests)  CD2A64A..D (4 tests)
CD2A65A..D (4 tests)

1. The following 17 tests are not applicable because 'SIZE representation clauses for record types are not supported.

CD1009G  CD2A71A..D (4 tests)
CD2A72A..D (4 tests)  CD2A74A..D (4 tests)
CD2A75A..D (4 tests)

m. CD1C04C is inapplicable for because this implementation does not support model numbers of a derived type that are not representable values of the parent type.

n. CD2A52J and CD2A54J are not applicable because these tests require an unsigned representation for a fixed point type; this implementation does not support unsigned fixed point representation.

o. CD2A52C..D (2 tests), CD2A52G..H (2 tests), CD2A54C..D (2 tests) and CD2A54H are not applicable because for this implementation the legality of a 'SIZE clause for a derived fixed point type can depend on the representation chosen for the parent type.

p. The following 23 tests are not applicable because 'SIZE representation clauses for access types are not supported.

CD2A81A..F (6 tests)  CD2A83A..C (3 tests)
CD2A83E..F (2 tests)  CD2A84B..I (8 tests)
CD2A84K..L (2 tests)  ED2A86A
CD2A87A

q. CD2A91A..E (5 tests) are not applicable because 'SIZE representation clauses for task types are not supported.

r. CD2B15B is not applicable because this implementation allows 'STORAGE_SIZE to yield the size requested by the user.

s. CD7004C, CD7005E and CD7006E are all not applicable because of other limitations, not specified in the Reference Manual, on the use of the pragmas SYSTEM_NAME, STORAGE_UNIT and MEMORY_SIZE.

t. AE2101C, EE2201D, and EE2201E use instantiations of package SEQUENTIAL IO with unconstrained array types and record types with discriminants without defaults. These instantiations are rejected by this compiler.
u. AE2101H, EE2401D, and EE2401G use instantiations of package DIRECT_IO with unconstrained array types and record types with discriminants without defaults. These instantiations are rejected by this compiler.

v. The following 236 tests are inapplicable because sequential, text, and direct access files are not supported:

CE2102A..C (3 tests) CE2102G..H (2 tests)
CE2102K               CE2102N..Y (12 tests)
CE2103C..D (2 tests)  CE2104A..D (4 tests)
CE2105A..B (2 tests)  CE2106A..B (2 tests)
CE2107A..H (8 tests)  CE2107L
CE2108A..B (2 tests)  CE2108C..H (6 tests)
CE2109A..C (3 tests)  CE2110A..D (4 tests)
CE2111A..I (9 tests)  CE2115A..B (2 tests)

CE3906A..C (3 tests)          CE3906E..F (2 tests)

w. CE3806G and CE3901A are inapplicable because this implementation raises NAME_ERROR on the attempt to create a text file with a non-null filename.

x. EE3412C is not applicable because this implementation's body of the package REPORT does not use TEXT_IO.

3.6 TEST, PROCESSING, AND EVALUATION MODIFICATIONS

It is expected that some tests will require modifications of code, processing, or evaluation in order to compensate for legitimate implementation behavior. Modifications are made by the AVF in cases where legitimate implementation behavior prevents the successful completion of an (otherwise) applicable test. Examples of such modifications include: adding a length clause to alter the default size of a collection; splitting a Class B test into subtests so that all errors are detected; and confirming that messages produced by an executable test demonstrate conforming behavior that was not anticipated by the test (such as raising one exception instead of another).

Modifications were required for 15 tests.

C45524A..N (14 tests) were modified because these tests expect that the result of continued division of a real number will be zero; the Ada Standard, however, only requires that the result be within the type's SAFE_SMALL of zero. Thus, these tests were modified to include a check that the result was in the smallest positive safe interval for the type. The implementation passed the modified tests. Each test was modified by inserting the following code after line 138;

ELSIF VAL <= F'SAFE SMALL THEN
  COMMENT ("UNDERFLOW IS GRADUAL")

The following test was split because syntax errors at one point resulted in the compiler not detecting other errors in the test:

B97103E
3.7 ADDITIONAL TESTING INFORMATION

3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.10 produced by the VAX/VMS x MC68020 XD Ada compiler was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and the compiler exhibited the expected behavior on all inapplicable tests.

3.7.2 Test Method

Testing of the VAX/VMS x MC68020 XD Ada compiler using ACVC Version 1.10 was conducted on-site by a validation team from the AVF. The configuration in which the testing was performed is described by the following designations of hardware and software components:

- **Host computer**: VAX Cluster comprising of a VAX 8600 and seven Micro VAX IIs
- **Host operating system**: VMS 5.0
- **Target computer**: MC68020 implemented on a MVME 133 XT board (bare machine)
- **Compiler**: XD Ada MC68020 T1.0-02V
- **Assembler**: XD Ada MC68020 T1.0-02V
- **Linker**: XD Ada MC68020 T1.0-02V
- **Loader/Downloader**: XD Ada MC68020 T1.0-02V
- **Runtime System**: XD Ada MC68020 T1.0-02V

The host and target computers were linked via a RS232 connector.

A magnetic tape containing all tests except for withdrawn tests and tests requiring unsupported floating-point precisions was taken on-site by the validation team for processing. Tests that make use of implementation-specific values were customized before being written to the magnetic tape. Tests requiring modifications during the prevalidation testing were not included in their modified form on the magnetic tape.

The contents of the magnetic tape were loaded directly onto the host computer.

After the test files were loaded to disk, the full set of tests was compiled and linked on the VAX Cluster, then all executable images were transferred to the MC68020 via the RS232 link and run. Results were printed from the host computer.
The compiler was tested using command scripts provided by SD-Scicon and reviewed by the validation team. The compiler was tested using all following option settings:

<table>
<thead>
<tr>
<th>OPTION</th>
<th>EFFECT</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEBUG=ALL</td>
<td>Both debugger symbol records and traceback information are included in the object file</td>
</tr>
<tr>
<td>OPT=(TIME,INLINE:NORMAL)</td>
<td>Provides full optimisation with time as primary objective and also provides normal subprogram expansion</td>
</tr>
<tr>
<td>CHECK</td>
<td>Overrides all the suppressing programs in the source code</td>
</tr>
<tr>
<td>NOANALYSIS_CHECK</td>
<td>No cross reference file is created</td>
</tr>
<tr>
<td>COPY_SOURCE</td>
<td>Creates a file containing a copy of the source code when errors are found</td>
</tr>
<tr>
<td>NODIAGNOSTICS</td>
<td>Does not create a file to contain the diagnostic messages from the computer</td>
</tr>
<tr>
<td>LIST</td>
<td>A Listing file is created</td>
</tr>
<tr>
<td>NOMACHINE_CODE</td>
<td>No machine code to be included in the Listing file</td>
</tr>
<tr>
<td>NOTE_SOURCE</td>
<td>Note's the file specification or the source code in the program library</td>
</tr>
<tr>
<td>SHOW = PORTABILITY</td>
<td>Includes a program portability summary in the Listing file</td>
</tr>
<tr>
<td>NOSYNTAX_ONLY</td>
<td>The compiler performs all checks on the source code</td>
</tr>
</tbody>
</table>

Tests were compiled, linked, and executed (as appropriate) using a cluster of 8 computers and 2 target computers. Test output, compilation listings, and job logs were captured on magnetic
media and archived at the AVF. The listings examined on-site by the validation team were also archived.

3.7.3 Test Site

Testing was conducted at SD-Scicon plc, Pembroke House, Pembroke Broadway, Camberley, Surrey and was completed on 21 March 1989.
SD-Scicon plc has submitted the following Declaration of Conformance concerning the XD Ada MC68020 T1.0-02V compiler.

DEuARATION OF CONFORMANCE

Implementor's Declaration

I, the undersigned, representing SD-Scicon plc, have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler(s) listed in this declaration. I declare that SD-Scicon plc is the owner of record of the Ada language compiler(s) listed above and, as such, is responsible for maintaining said compiler(s) in conformance to ANSI/MIL-STD-1815A. All certificates and registrations for Ada language compiler(s) listed in this declaration shall be made only in the owner's corporate name.

Date: 21/3/87
Owner's Declaration

I, the undersigned, representing SD-Scicon plc, take full responsibility for implementation and maintenance of the Ada compiler(s) listed above, and agree to the public disclosure of the final Validation Summary Report. I declare that all of the Ada language compilers listed, and their host/target performance, are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A.

Date: 21/3/84
APPENDIX F

APPENDIX B

APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the XD Ada MC68020 T1.0-02V compiler, as described in this Appendix, are provided by SD-Scicon plc. Unless specifically noted otherwise, references in this appendix are to compiler documentation and not to this report. Implementation-specific portions of the package STANDARD, which are not a part of Appendix F, are:

package STANDARD is

...

type INTEGER is range -2147483648 .. 2147483647;
type SHORT_INTEGER is range -32768 .. 32767;
type SHORT_SHORT_INTEGER is range -128 .. 127;

type FLOAT is digits 6 range -(2**128 - 2**104) ..
                          2**128 - 2**104;
type LONG_FLOAT is digits 15 range -(2**1024 - 2**971) ..
                          2**1024 - 2**971;

type DURATION is delta 1.E-4 range -131072.0000 ..
                         131071.9999;

...

end STANDARD;
NOTE

This appendix is not part of the standard definition of the Ada programming language.

This appendix summarizes the following implementation-dependent characteristics of XD Ada:

- Listing the XD Ada pragmas and attributes.
- Giving the specification of the package SYSTEM.
- Presenting the restrictions on representation clauses and unchecked type conversions.
- Giving the conventions for names denoting implementation-dependent components in record representation clauses.
- Giving the interpretation of expressions in address clauses.
- Presenting the implementation-dependent characteristics of the input-output packages.
- Presenting other implementation-dependent characteristics.
F.1 Implementation-Dependent Pragmas

XD Ada provides the following pragmas, which are defined elsewhere in the text. In addition, XD Ada restricts the predefined language pragmas INLINE and INTERFACE, replaces pragma SHARED with pragma VOLATILE, and provides pragma SUPPRESS_ALL in addition to pragma SUPPRESS. See Appendix B for a descriptive pragma summary.

- EXPORT_EXCEPTION (see Section 13.9a.3.2)
- EXPORT_FUNCTION (see Section 13.9a 1.2)
- EXPORT_OBJECT (see Section 13.9a 2.2)
- EXPORT_PROCEDURE (see Section 13.9a 1.2)
- IMPORT_EXCEPTION (see Section 13.9a 3.1)
- IMPORT_FUNCTION (see Section 13.9a 1.1)
- IMPORT_OBJECT (see Section 13.9a 2.1)
- IMPORT_PROCEDURE (see Section 13.9a 1.1)
- LEVEL (see Section 13.5.1)
- LINK_OPTION (see Appendix B)
- MACHINE_CODE_PROCEDURE (see Section 13.8)
- SUPPRESS_ALL (see Section 11.7)
- TITLE (see Annex B)
- VOLATILE (see Section 9.11)

F.2 Implementation-Dependent Attributes

XD Ada provides the following attributes, which are defined elsewhere in the text. See Appendix A for a descriptive attribute summary.

- BIT (see Section 13.7.2)
- MACHINE_SIZE (see Section 13.7.2)
- TYPE_CLASS (see Section 13.7a.2)
F.3 Specification of the Package System

The package SYSTEM for the MC68020 is as follows:

F.3.1 Package System for MC68020 Target

package SYSTEM is
  type NAME is (MC68020, MIL_STD_1750A);
  SYSTEM_NAME : constant NAME := MC68020;
  STORAGE_UNIT : constant := 8;
  MEMORY_SIZE : constant := 2**32;
  MIN_INT : constant := -(2**31);
  MAX_INT : constant := 2**31-1;
  MAX_DIGITS : constant := 18;
  MAX_MANTISSA : constant := 31;
  FINE_DELTA : constant := 2.0**(-31);
  TICK : constant := 162.5E-6
  subtype PRIORITY is INTEGER range 0 .. 15;
  subtype LEVEL is INTEGER range 0 .. 7;
  type ADDRESS_INT is range MIN_INT .. MAX_INT;
  -- Address type
  type ADDRESS is private;
  ADDRESS_ZERO : constant ADDRESS;
  --
  function TO_ADDRESS (ADDR : universal_integer) return ADDRESS;
  --
  function CONVERT_ADDRESS (ADDR : ADDRESS) return ADDRESS_INT;
  function CONVERT_ADDRESS (ADDR : ADDRESS_INT) return ADDRESS;
  function "-" (LEFT : ADDRESS; RIGHT : ADDRESS_INT) return ADDRESS;
  function "/" (LEFT : ADDRESS; RIGHT : ADDRESS) return ADDRESS;
  function ">" (LEFT : ADDRESS; RIGHT : ADDRESS) return BOOLEAN;
  function ">=" (LEFT, RIGHT : ADDRESS) return BOOLEAN;
  function "><" (LEFT, RIGHT : ADDRESS) return BOOLEAN;
  function ">=" (LEFT, RIGHT : ADDRESS) return BOOLEAN;
  -- Note that because ADDRESS is a private type
  -- the functions "-" and "/" are already available
  -- Generic functions used to access memory
generic
  type TARGET is private;
function FETCH_FROM_ADDRESS (A : ADDRESS) return TARGET;

generic
  type TARGET is private;
procedure ASSIGN_TO_ADDRESS (A : ADDRESS; T : TARGET);

type TYPECLASS is (TYPECLASS_ENUMERATION,
  TYPECLASS_INTEGER,
  TYPECLASS_FIXED_POINT,
  TYPECLASS_FLOATING_POINT,
  TYPECLASS_ARRAY,
  TYPECLASS_RECORD,
  TYPECLASS_ACCESS,
  TYPECLASS_TASK,
  TYPECLASS_ADDRESS);

-- X6 Ada hardware-oriented types and functions
type BIT_ARRAY is array (INTEGER range <>) of BOOLEAN;
pragma PACK(BIT_ARRAY);
subtype BIT_ARRAY_8 is BIT_ARRAY (0 .. 7);
subtype BIT_ARRAY_16 is BIT_ARRAY (0 .. 15);
subtype BIT_ARRAY_32 is BIT_ARRAY (0 .. 31);
subtype BIT_ARRAY_64 is BIT_ARRAY (0 .. 63);
type UNSIGNED_BYTE is range 0 .. 255;
for UNSIGNED_BYTE'SIZE use 8;
function "not" (LEFT : UNSIGNED_BYTE) return UNSIGNED_BYTE;
function "and" (LEFT, RIGHT : UNSIGNED_BYTE) return UNSIGNED_BYTE;
function "or" (LEFT, RIGHT : UNSIGNED_BYTE) return UNSIGNED_BYTE;
function "xor" (LEFT, RIGHT : UNSIGNED_BYTE) return UNSIGNED_BYTE;
function TO_UNSIGNED_BYTE (LEFT : BIT_ARRAY_8) return UNSIGNED_BYTE;
function TO_BIT_ARRAY_8 (LEFT : UNSIGNED_BYTE) return BIT_ARRAY_8;
type UNSIGNED_BYTE_ARRAY is array (INTEGER range <>) of UNSIGNED_BYTE;
type UNSIGNED_WORD is range 0 .. 65535;
for UNSIGNED_WORD'SIZE use 16;
function "not" (LEFT : UNSIGNED_WORD) return UNSIGNED_WORD;
function "and" (LEFT, RIGHT : UNSIGNED_WORD) return UNSIGNED_WORD;
function "or" (LEFT, RIGHT : UNSIGNED_WORD) return UNSIGNED_WORD;
function "xor" (LEFT, RIGHT : UNSIGNED_WORD) return UNSIGNED_WORD;
function TO_UNSIGNED_WORD (LEFT : BIT_ARRAY_16) return UNSIGNED_WORD;
function TO_BIT_ARRAY_16 (LEFT : UNSIGNED_WORD) return BIT_ARRAY_16;
type UNSIGNED_WORD_ARRAY is array (INTEGER range <>) of UNSIGNED_WORD;

--
type UNSIGNED_LONGWORD is range MIN_INT .. MAX_INT;

function "not" (LEFT : UNSIGNED_LONGWORD) return UNSIGNED_LONGWORD;
function "and" (LEFT, RIGHT : UNSIGNED_LONGWORD) return UNSIGNED_LONGWORD;
function "or" (LEFT, RIGHT : UNSIGNED_LONGWORD) return UNSIGNED_LONGWORD;
function "xor" (LEFT, RIGHT : UNSIGNED_LONGWORD) return UNSIGNED_LONGWORD;

F-4 Implementation-Dependent Characteristics
function TO_UNSIGNED_LONGWORD (LEFT : BIT_ARRAY; return UNSIGNED_LONGWORD);
function TO_BIT_ARRAY (LEFT : UNSIGNED_LONGWORD return BIT_ARRAY);
type UNSIGNED_LONGWORD_ARRAY is array (INTEGER range <>) of UNSIGNED_LONGWORD;

-- Conventional names for static subtypes of type UNSIGNED_LONGWORD
subtype UNSIGNED_1 is UNSIGNED_LONGWORD range 0..1;
subtype UNSIGNED_2 is UNSIGNED_LONGWORD range 0..2**-1;
subtype UNSIGNED_3 is UNSIGNED_LONGWORD range 0..2**4-1;
subtype UNSIGNED_4 is UNSIGNED_LONGWORD range 0..2**8-1;
subtype UNSIGNED_5 is UNSIGNED_LONGWORD range 0..2**16-1;
subtype UNSIGNED_6 is UNSIGNED_LONGWORD range 0..2**32-1;
subtype UNSIGNED_7 is UNSIGNED_LONGWORD range 0..2**64-1;
subtype UNSIGNED_8 is UNSIGNED_LONGWORD range 0..2**128-1;
subtype UNSIGNED_9 is UNSIGNED_LONGWORD range 0..2**256-1;
subtype UNSIGNED_10 is UNSIGNED_LONGWORD range 0..2**512-1;
subtype UNSIGNED_11 is UNSIGNED_LONGWORD range 0..2**1024-1;
subtype UNSIGNED_12 is UNSIGNED_LONGWORD range 0..2**2048-1;
subtype UNSIGNED_13 is UNSIGNED_LONGWORD range 0..2**4096-1;
subtype UNSIGNED_14 is UNSIGNED_LONGWORD range 0..2**8192-1;
subtype UNSIGNED_15 is UNSIGNED_LONGWORD range 0..2**16384-1;
subtype UNSIGNED_16 is UNSIGNED_LONGWORD range 0..2**32768-1;
subtype UNSIGNED_17 is UNSIGNED_LONGWORD range 0..2**65536-1;
subtype UNSIGNED_18 is UNSIGNED_LONGWORD range 0..2**131072-1;
subtype UNSIGNED_19 is UNSIGNED_LONGWORD range 0..2**262144-1;
subtype UNSIGNED_20 is UNSIGNED_LONGWORD range 0..2**524288-1;
subtype UNSIGNED_21 is UNSIGNED_LONGWORD range 0..2**1048576-1;
subtype UNSIGNED_22 is UNSIGNED_LONGWORD range 0..2**2097152-1;
subtype UNSIGNED_23 is UNSIGNED_LONGWORD range 0..2**4194304-1;
subtype UNSIGNED_24 is UNSIGNED_LONGWORD range 0..2**8388608-1;
subtype UNSIGNED_25 is UNSIGNED_LONGWORD range 0..2**16777216-1;

subtype UNSIGNED_27 is UNSIGNED_LONGWORD range 0..2**67108864-1;
subtype UNSIGNED_28 is UNSIGNED_LONGWORD range 0..2**134217728-1;
subtype UNSIGNED_29 is UNSIGNED_LONGWORD range 0..2**268435456-1;
subtype UNSIGNED_30 is UNSIGNED_LONGWORD range 0..2**536870912-1;
subtype UNSIGNED_31 is UNSIGNED_LONGWORD range 0..2**1073741824-1;

private
-- Not shown
end SYSTEM;
F.4 Restrictions on Representation Clauses

The representation clauses allowed in XD Ada are length, enumeration, record representation, and address clauses.

In XD Ada, a representation clause for a generic formal type or a type that depends on a generic formal type is not allowed. In addition, a representation clause for a composite type that has a component or subcomponent of a generic formal type or a type derived from a generic formal type is not allowed.

Restrictions on length clauses are specified in 13.2; restrictions on enumeration representation clauses are specified in Section 13.3; and restrictions on record representation clauses are specified in Section 13.4.

F.5 Conventions for Implementation-Generated Names Denoting Implementation-Dependent Components in Record Representation Clauses

XD Ada does not allocate implementation-dependent components in records.

F.6 Interpretation of Expressions Appearing in Address Clauses

Expressions appearing in address clauses must be of the type ADDRESS defined in package SYSTEM (see Section 13.7a.1 and Section F.3).

XD Ada allows address clauses for variables (see Section 13.5). For address clauses on variables, the address expression is interpreted as a Motorola full 32-bit address.

XD Ada supports address clauses on task entries to allow interrupts to cause a reschedule directly. For address clauses on task entries, the address expression is interpreted as a Motorola exception vector offset.
In XD Ada for the MC68020 family, values of type SYSTEM ADDRESS are interpreted as integers in the range $0 \leq 2^{32} - 1$. As SYSTEM ADDRESS is a private type, the only operations allowed on objects of this type are those given in package SYSTEM.

### F.7 Restrictions on Unchecked Type Conversions

XD Ada supports the generic function UNCHECKED_CONVERSION with the restrictions given in Section 13.10.2.

### F.8 Implementation-Dependent Characteristics of Input-Output Packages

The packages SEQUENTIAL_IO and DIRECT_IO are implemented as null packages that conform to the specification given in the LRM. The packages raise the exceptions specified in Chapter 14 of the LRM. The two possible exceptions that are raised by these packages are given here, in the order in which they are raised.

<table>
<thead>
<tr>
<th>Exception</th>
<th>When Raised</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_ERROR</td>
<td>Raised by an attempt to operate upon a file that is not open (no files can be opened).</td>
</tr>
<tr>
<td>USE_ERROR</td>
<td>Raised if exception STATUS_ERROR is not raised.</td>
</tr>
</tbody>
</table>

MODE_ERROR cannot be raised since no file can be opened (therefore it cannot have a current mode) and NAME_ERROR cannot be raised since there are no restrictions on file names.

The predefined package LOW_LEVEL_IO is not provided.
F.8.1 The Package TEXT_IO

The package TEXT_IO conforms to the specification given in the LRM. String input-output is implemented as defined. File input-output is supported to STANDARD_INPUT and STANDARD_OUTPUT only. The possible exceptions that are raised by package TEXT_IO are as follows:

<table>
<thead>
<tr>
<th>Exception</th>
<th>When Raised</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_ERROR</td>
<td>Raised by an attempt to operate upon a file that is not open (no files can be opened).</td>
</tr>
<tr>
<td>MODE_ERROR</td>
<td>Raised by an attempt to read from, or test for the end of, STANDARD_OUTPUT, or to write to STANDARD_INPUT.</td>
</tr>
<tr>
<td>END_ERROR</td>
<td>Raised by an attempt to read past the end of STANDARD_INPUT.</td>
</tr>
<tr>
<td>USE_ERROR</td>
<td>Raised when an unsupported operation is attempted. that would otherwise be legal.</td>
</tr>
</tbody>
</table>

NAME_ERROR cannot be raised since there are no restrictions on file names.

The type COUNT is defined as follows:

\[
\text{type COUNT is range 0 .. INTEGER'LAST;}
\]

The subtype FIELD is defined as follows:

\[
\text{type FIELD is INTEGER range 0 .. 13;}
\]

F.8.2 The Package IO_EXCEPTIONS

The specification of the package IO_EXCEPTIONS is the same as that given in the LRM.

F.9 Other Implementation Characteristics

Implementation characteristics associated with the definition of a main program, various numeric ranges, and implementation limits are summarized in the following sections.
F.9.1 Definition of a Main Program

Any library procedure can be used as a main program provided that it has no formal parameters.

F.9.2 Values of Integer Attributes

The ranges of values for integer types declared in package STANDARD are as follows:

- **SHORT_SHORT_INTEGER**: $-2^{15} \ldots 2^{15} - 1$ (-32768 .. 32767)
- **SHORT_INTEGER**: $-2^{31} \ldots 2^{31} - 1$ (-2147483648 .. 2147483647)
- **INTEGER**: $-2^{63} \ldots 2^{63} - 1$ (-9223372036854775808 .. 9223372036854775807)

For the package TEXT_IO, the range of values for types **COUNT** and **FIELD** are as follows:

- **COUNT**: $0 \ldots 2^{31} - 1$ (0 .. 2147483647)
- **FIELD**: $0 \ldots 128$

F.9.3 Values of Floating-Point Attributes

Floating-point types are described in Section 3.5.7. The representation attributes of floating-point types are summarized in the following table:
<table>
<thead>
<tr>
<th>DIGITS</th>
<th>FLOAT</th>
<th>LONG_FLOAT</th>
<th>LONG_LONG_FLOAT</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIZE</td>
<td>32</td>
<td>64</td>
<td>96</td>
</tr>
<tr>
<td>MANTISSA</td>
<td>21</td>
<td>51</td>
<td>91</td>
</tr>
<tr>
<td>EMAX</td>
<td>84</td>
<td>204</td>

F.9.4 Attributes of Type DURATION

The values of the significant attributes of type DURATION are as follows:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DURATION·DELTA</td>
<td>1.0E-4</td>
<td>(10^{-4})</td>
</tr>
<tr>
<td>DURATION·SMALL</td>
<td>2.10E-14</td>
<td>(2^{-14})</td>
</tr>
<tr>
<td>DURATION·FIRST</td>
<td>-1.31072.0000</td>
<td>(-2^{24})</td>
</tr>
<tr>
<td>DURATION·LAST</td>
<td>1.31071.9999</td>
<td>(2^{25} - DELTA)</td>
</tr>
</tbody>
</table>

F.9.5 Implementation Limits

<table>
<thead>
<tr>
<th>Limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>126</td>
<td>Maximum identifier length (number of characters)</td>
</tr>
<tr>
<td>120</td>
<td>Maximum number of characters in a source line</td>
</tr>
<tr>
<td>2^{10}</td>
<td>Maximum number of library units and subunits in a compilation closure¹</td>
</tr>
<tr>
<td>2^{12}</td>
<td>Maximum number of library units and subunits in an execution closure²</td>
</tr>
<tr>
<td>2^{11} - 1</td>
<td>Maximum number of enumeration literals in an enumeration type definition</td>
</tr>
<tr>
<td>2^{10} - 1</td>
<td>Maximum number of lines in a source file</td>
</tr>
<tr>
<td>2^{31} - 1</td>
<td>Maximum number of bits in any object</td>
</tr>
<tr>
<td>2^{31} - 1</td>
<td>Maximum number of exceptions</td>
</tr>
</tbody>
</table>

¹The compilation closure of a given unit is the total set of units that the given unit depends on, directly and indirectly.

²The execution closure of a given unit is the compilation closure plus all associated secondary units.
Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below:

<table>
<thead>
<tr>
<th>Name and Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ACCSIZE</td>
<td>32</td>
</tr>
<tr>
<td><em>An integer literal whose value is the number of bits sufficient to hold any value of an access type.</em></td>
<td></td>
</tr>
<tr>
<td>$BIG_ID1</td>
<td>(1..254=&gt;'A', 255=&gt;1)</td>
</tr>
<tr>
<td><em>Identifier the size of the maximum input line length with varying last character.</em></td>
<td></td>
</tr>
<tr>
<td>$BIG_ID2</td>
<td>(1..254=&gt;'A', 255=&gt;2)</td>
</tr>
<tr>
<td><em>Identifier the size of the maximum input line length with varying last character.</em></td>
<td></td>
</tr>
<tr>
<td>$BIG_ID3</td>
<td>(1..127=&gt;'A', 128=&gt;3, 129..255=&gt;'A')</td>
</tr>
<tr>
<td><em>Identifier the size of the maximum input line length with varying middle character.</em></td>
<td></td>
</tr>
<tr>
<td>$BIG_ID4</td>
<td>(1..127=&gt;'A', 128=&gt;4, 129..255=&gt;'A')</td>
</tr>
<tr>
<td><em>Identifier the size of the maximum input line length with varying middle character.</em></td>
<td></td>
</tr>
<tr>
<td>$BIG_INT_LIT</td>
<td>(1..252=&gt;0, 253..255=&gt;298)</td>
</tr>
<tr>
<td><em>An integer literal of value 298 with enough leading zeroes so that it is the size of the maximum line length.</em></td>
<td></td>
</tr>
</tbody>
</table>
$BIG_REAL_LIT
A universal real literal of value
690.0 with enough leading zeroes to
be the size of the maximum line
length.

$BIG_STRING1
A string literal which when catenated
with BIG_STRING2 yields the image of
BIG_ID1.

$BIG_STRING2
A string literal which when catenated
to the end of BIG_STRING1 yields the
image of BIG_ID1.

$BLANKS
A sequence of blanks twenty
caracters less than the size of the
maximum line length.

$COUNT_LAST
A universal integer literal whose
value is TEXT_IO.COUNT'LAST.

$DEFAULT_MEM_SIZE
An integer literal whose value is
SYSTEM.MEMORY_SIZE.

$DEFAULT_STOR_UNIT
An integer literal whose value is
SYSTEM.STORAGE_UNIT.

$DEFAULT_SYS_NAME
The value of the constant
SYSTEM.SYSTEM_NAME.

$DELTA_DOC
A real literal whose value is
SYSTEM.FINE_DELTA.

$FIELD_LAST
A universal integer literal whose
value is TEXT_IO.FIELD'LAST.

$FIXED_NAME
The name of a predefined fixed-point
type other than DURATION.
$FLOAT_NAME
The name of a predefined floating-point type other than FLOAT, SHORT_FLOAT, or LONG_FLOAT.

$GREATER_THAN_DURATION
A universal real literal that lies between DURATION'BASE'LAST and DURATION'LAST or any value in the range of DURATION.

$GREATER_THAN_DURATION_BASE_LAST
A universal real literal that is greater than DURATION'BASE'LAST.

$HIGH_PRIORITY
An integer literal whose value is the upper bound of the range for the subtype SYSTEM.PRIORITY.

$ILLEGAL_EXTERNAL_FILE_NAME1
An external file name which contains invalid characters.

$ILLEGAL_EXTERNAL_FILE_NAME2
An external file name which is too long.

$INTEGER_FIRST
A universal integer literal whose value is INTEGER'FIRST.

$INTEGER_LAST
A universal integer literal whose value is INTEGER'LAST.

$INTEGER_LAST_PLUS_1
A universal integer literal whose value is INTEGER'LAST+1.

$LESS_THAN_DURATION
A universal real literal that lies between DURATION'BASE'FIRST and DURATION'FIRST or any value in the range of DURATION.

$LESS_THAN_DURATION_BASE_FIRST
A universal real literal that is less than DURATION'BASE'FIRST.
TEST PARAMETERS

$LOW_PRIORITY
An integer literal whose value is the lower bound of the range for the subtype SYSTEM.PRIORITY.

$MANTISSA_DOC
An integer literal whose value is SYSTEM.MAX_MANTISSA.

$MAX_DIGITS
Maximum digits supported for floating-point types.

$MAX_IN_LEN
Maximum input line length permitted by the implementation.

$MAX_INT
A universal integer literal whose value is SYSTEM.MAX_INT.

$MAX_INT_PLUS_1
A universal integer literal whose value is SYSTEM.MAX_INT+1.

$MAX_LEN_INT_BASED_LITERAL
A universal integer based literal whose value is 2#11# with enough leading zeroes in the mantissa to be MAX_IN_LEN long.

$MAX_LEN_REAL_BASED_LITERAL
A universal real based literal whose value is 16:F.E: with enough leading zeroes in the mantissa to be MAX_IN_LEN long.

$MAX_STRING_LITERAL
A string literal of size MAX_IN_LEN, including the quote characters.

$MIN_INT
A universal integer literal whose value is SYSTEM.MIN_INT.
$\text{MIN\_TASK\_SIZE}$

An integer literal whose value is the number of bits required to hold a task object which has no entries, no declarations, and "NULL;" as the only statement in its body.

$\text{NAME}$

A name of a predefined numeric type other than $\text{FLOAT, INTEGER, SHORT\_FLOAT, SHORT\_INTEGER, LONG\_FLOAT, or LONG\_INTEGER.}$

$\text{NAME\_LIST}$

A list of enumeration literals in the type $\text{SYSTEM\_NAME,}$ separated by commas.

$\text{NEG\_BASED\_INT}$

A based integer literal whose highest order nonzero bit falls in the sign bit position of the representation for $\text{SYSTEM\_MAX\_INT.}$

$\text{NEW\_MEM\_SIZE}$

An integer literal whose value is a permitted argument for pragma $\text{memory\_size,}$ other than $\text{DEFAULT\_MEM\_SIZE.}$ If there is no other value, then use $\text{DEFAULT\_MEM\_SIZE.}$

$\text{NEW\_STOR\_UNIT}$

An integer literal whose value is a permitted argument for pragma $\text{storage\_unit,}$ other than $\text{DEFAULT\_STOR\_UNIT.}$ If there is no other permitted value, then use value of $\text{SYSTEM\_STORAGE\_UNIT.}$

$\text{NEW\_SYS\_NAME}$

A value of the type $\text{SYSTEM\_NAME,}$ other than $\text{DEFAULT\_SYS\_NAME.}$ If there is only one value of that type, then use that value.
$\text{TASK}\_\text{SIZE}$  
32  
An integer literal whose value is the number of bits required to hold a task object which has a single entry with one inout parameter.

$\text{TICK}$  
162.5E-6  
A real literal whose value is \text{SYSTEM.TICK}. 
Some tests are withdrawn from the ACVC because they do not conform to the Ada Standard. The following 43 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form AI-ddddd is to an Ada Commentary.

E28005C This test expects that the string "-- TOP OF PAGE. --63" of line 204 will appear at the top of the listing page due to a pragma PAGE in line 203; but line 203 contains text that follows the pragma, and it is this that must appear at the top of the page.

A39005G This test unreasonably expects a component clause to pack an array component into a minimum size (line 30).

B97102E This test contains an unintended legality: a select statement contains a null statement at the place of a selective wait alternative (line 31).

BC3009B This test wrongly expects that circular instantiations will be detected in several compilation units even though none of the units is illegal with respect to the units it depends on; by AI-00256, the illegality need not be detected until execution is attempted (line 95).

CD2A62D This test wrongly requires that an array object's size be no greater than 10 although its subtype's size was specified to be 40 (line 137).

CD2A63A..D, CD2A66A..D, CD2A73A..D, CD2A76A..D [16 tests] These tests wrongly attempt to check the size of objects of a derived type (for which a 'SIZE length clause is given) by passing them to a derived subprogram (which implicitly converts them to the parent type (Ada standard 3.4:14)). Additionally, they use the 'SIZE length clause and attribute, whose interpretation is considered problematic by the WG9 ARG.

CD2A81G, CD2A83G, CD2A84N & M, & CD50110 [5 tests] These tests assume that dependent tasks will terminate while the main program executes a loop that simply

Validation Summary Report AVF-VSR-90502/48
SD-Scicon plc VAX/VMS x MC68020 XD Ada
APPENDIX D Page 1 of 3
tests for task termination; this is not the case, and
the main program may loop indefinitely (lines 74, 85,
86 & 96, 86 & 96, and 58, resp.).

CD2B15C & CD7205C
These tests expect that a 'STORAGE_SIZE length clause
provides precise control over the number of designated
objects in a collection; the Ada standard 13.7:15
allows that such control must not be expected.

CD7203B & CD7204B
These tests use the 'SIZE length clause and attribute,
whose interpretation is considered problematic by the
WG9 ARG.

CD7205D
This test checks an invalid test objective: it treats
the specification of storage to be reserved for a
task's activation as though it were like the
specification of storage for a collection.

CE2107I
This test requires that objects of two similar scalar
types be distinguished when read from a file--
DATA ERROR is expected to be raised by an attempt to
read one object as of the other type. However, it is
not clear exactly how the Ada standard 14.2.4:4 is to
be interpreted; thus, this test objective is not
considered valid. (line 90)
WITHDRAWN TESTS

CE3111C This test requires certain behavior, when two files are associated with the same external file, that is not required by the Ada standard.

CE3301A This test contains several calls to END_OF_LINE & END_OF_PAGE that have no parameter: these calls were intended to specify a file, not to refer to STANDARD_INPUT (lines 103, 107, 118, 132, & 136).

CE3411B This test requires that a text file's column number be set to COUNT'LAST in order to check that LAYOUT_ERROR is raised by a subsequent PUT operation. But the former operation will generally raise an exception due to a lack of available disk space, and the test would thus encumber validation testing.
