## ABSTRACT

This Software Requirements Specification (SRS) specifies the engineering and qualification requirements for the Internal Processing CSCI of the Mapping and Graphic Information Capability (MAGIC). Furthermore, this specification will be used as the basis for the design and formal testing of that CSCI

The SRS is divided into three major sections. These sections cover Engineering Requirements (Section 3), Qualification Requirements (Section 4), and Preparation for Delivery (Section 5).

This specification supersedes both the Rational-generated Software Requirements Specification (configuration identifier 8734/89-SRS-IP-003) and the Interface Requirements Specification (configuration identifier 8734/89-IRS-GIPSY-003) for the Internal Processing CSCI that was delivered under Contract Number DCA100-89-C-0015 and dated 13 September 1989.

## SECTION 1. SCOPE

This section provides an introduction to the specification. The following paragraphs discuss the identification of the Computer Software Configuration Item (CSCI), provide an overview of the CSCI, and provide a document overview.

### 1.1 Identification

This Software Requirements Specification (SRS) establishes the engineering and qualification requirements for the Internal Processing CSCI (CSCI-7).

### 1.2 CSCI Overview

The Internal Processing CSCI provides capabilities that are hardware-dependent or required by more than one CSCI. a multitude of services unseen by the user but critical to MAGIC functionality. As its name implies, a variety of low-level services that tie the various functional CSCI's together are provided. They are as follows:

- a. MAGIC environment initialization and cleanup
- b. File input/output (I/O) functions such as open, close, read, and write operations
- c. Functions useful to a number of MAGIC's CSCIs, such as string utilities and pathname processing
- d. Communications between the Unix workstation and the WWMCCS host platform.

### 1.3 Document Overview

This SRS specifies the requirements allocated to the Internal Processing CSCI and enables the Government to assess whether or not the completed CSCI complies with those requirements. Upon Government approval and authentication, the SRS becomes the Allocated Baseline for the CSCI and is used by the contractor as the basis for development and formal testing of the CSCI.

As such, this SRS specifies the complete list of requirements (functional, interface, performance, qualification, etc.) for the Internal Processing CSCI. It includes requirements for programming design, adaptation, quality factors, and traceability of the CSCI, as well as delivery preparation and ancillary notes, such as references and terms and abbreviations.

## SECTION 2. APPLICABLE DOCUMENTS

This section specifies the applicable reference documents that have been used during the preparation of this specification.

### 2.1 Government Documents

The following documents of the exact issue shown form a part of this specification to the extent specified herein. In the event of conflict between the documents referenced herein and this specification, this specification shall be considered a superseding requirement.

#### SPECIFICATIONS:

DI-MCCR-80025A	Software Requirements Specifications Data Item Description (DID)
SDP 2-90	Software Development Plan (SDP) for the Mapping and Graphic Information Capability System (MAGIC)
<reference>	Functional Description for the Graphic Information Presentation System (GIPSY)
<reference>	Software Quality Program Plan for the Mapping and Graphic Information Capability System (MAGIC)

#### STANDARDS:

DOD-STD-2167A	Defense System Software Development
---------------	-------------------------------------

#### DRAWINGS:

None

#### OTHER PUBLICATIONS:

MIT/LCS/TR-368	The X Window System
PM 1-90	Documentation Standards and Publications Style Manual
TM 405-90	Software Standards and Procedures Manual for the JNGG Graphics Program

Copies of the specifications, standards, drawings, and publications required by suppliers in connection with specified procurement functions should be obtained from the contracting agency or as directed by the contracting officer.

## 2.2 Non-Government Documents

The following documents of the exact issue shown form a part of this specification to the extent specified herein. In the event of conflict between the documents referenced herein and this specification, this specification shall be considered a superseding requirement.

### SPECIFICATIONS:

None

### STANDARDS:

ANSI X3.159-1989    Programming Language C

### DRAWINGS:

None

### OTHER PUBLICATIONS:

None

Technical society and technical association specifications and standards are generally available for reference from libraries. They are also distributed among technical groups and using Federal Agencies.

## SECTION 3. ENGINEERING REQUIREMENTS

This section specifies the engineering requirements necessary to ensure proper development of the Internal Processing CSCI. All requirements included in this section are allocated from those defined in appendix C of the Functional Description (FD) referenced in the specifications of subparagraph 2.1.

### 3.1 CSCI External Interface Requirements

The Internal Processing CSCI interfaces with the Human Interface, Data Management, Business Graphics, and Geographic Mapping CSCIs as well as the C Library. The following subparagraphs provide a general description of each interface.

3.1.1 Human Interface to Internal Processing (INT-1.005). This interface is used by the Human Interface CSCI to access low-level and system-wide utilities and services resident in the Internal Processing CSCI (e.g., path name manipulation, string manipulation, Unix system toolbox routines, and modem toolbox control).

This interface satisfies the following functional requirements:

- a. Use OSF/Motif to provide the graphical user interface (A.11)
- b. Perform file management (G.1)
- c. Control input/output operations (G.2)
- d. Save and recall all information necessary to start a new GIPSY session from the departure point of the current GIPSY session (G.3)
- e. Convert the qualified data and its internal matrix version to Data Interchange Format (DIF) (G.4)
- f. Control various devices such as terminals, printers, or plotters via device drivers (G.7)
- g. Request operating system services (G.8)
- h. Perform specialized processing by executing system-supplied and user subroutines (G.9)
- i. Allowing certain globals to prevail throughout a user session (G.10)
  - (1) Command line options (G.10.a)
  - (2) Module transfer (G.10.b)
  - (3) Classification markings (G.10.c)

- (4) Report titles and modifying them (G.10.d)
- (5) Clearing specific commands (G.10.e)
- (6) Size of text (G.10.f)
- (7) Color of text (G.10.g)
- j. Color processing (G.11)
- k. User control of operating environment attributes (G.12)
- l. Identifying GIPSY's collective input statements (G.13)
  - (1) PCS (G.13.a)
  - (2) Clear PCS (G.13.b)
  - (3) Save PCS (G.13.c)
  - (4) RETURN statement (G.13.d)
- m. Identify and save GIPSY's internal data structures (G.14)
  - (1) FDT (G.14.a)
  - (2) QDF (G.14.b)
  - (3) QDT (G.14.c)
  - (4) DAFC (G.14.d)
  - (5) GDS (G.14.e)
- n. Executing user-supplied subroutines (G.15)
- o. Executing other TSS or JDAC commands (G.16).

3.1.2 Data Management to Internal Processing (INT-2.002). This interface is used by the Data Management CSCI to access low-level and system-wide utilities and services resident in the Internal Processing CSCI (e.g., path name manipulation, string manipulation, and Unix system toolbox routines).

This interface satisfies the following functional requirements:

- a. Describe data records (B.2)
- b. FDT (B.2.a)
- c. Identify any conditional expressions (B.3)

- d. Identify any arithmetic expressions (B.4)
- e. Manipulate data (B.7)
  - (1) Add new fields (B.7.b)
  - (2) Qualify data (B.7.d)
- f. Populate a database or a data file (B.8)
- g. Perform file management (G.1)
- h. Control input/output operations (G.2)
- i. Convert the qualified data and its internal matrix version to Data Interchange Format (DIF) (G.4)
- j. Request operating system services (G.8)
- k. User control of operating environment attributes (G.12).

3.1.3 Business Graphics to Internal Processing (INT-3.002). This interface is used by the Business Graphics CSCI to access low-level and system-wide utilities and services resident in the Internal Processing CSCI (e.g., path name manipulation, string manipulation, and Unix system toolbox routines).

This interface satisfies the following functional requirements:

- a. Save a tabular report (C.5)
- b. Access a previously saved tabular report (C.6)
- c. Save a graphic report (C.15)
- d. Save plotted output (C.16)
- e. Perform file management (G.1)
- f. Control input/output operations (G.2)
- g. Request operating system services (G.8)
- h. User control of operating environment attributes (G.12)
- i. Identify and save GIPSY's internal data structures (G.14)
  - (1) FDT (G.14.a)
  - (2) QDF (G.14.b)

(3) QDT (G.14.c)

(4) GDS (G.14.e).

3.1.4 Geographic Mapping to Internal Processing (INT-4.001). This interface is used by the Geographic Mapping CSCI to access low-level and system-wide utilities and services resident in the Internal Processing CSCI (e.g., path name manipulation, string manipulation, and Unix system toolbox routines).

This interface satisfies the following functional requirements:

- a. Perform file management (G.1)
- b. Control input/output operations (G.2)
- c. Request operating system services (G.8)
- d. User control of operating environment attributes (G.12).

3.1.5 Internal Processing to C Library (INT-7.001). This interface establishes the connection between the C Library and the Internal Processing CSCI. This interface is used to access standard C language functions and to utilize C types.

This interface satisfies the following functional requirements:

- a. Perform file management (G.1)
- b. Control input/output operations (G.2)
- c. Save and recall all information necessary to start a new GIPSY session from the departure point of the current GIPSY session (G.3)
- d. Convert the qualified data and its internal matrix version to Data Interchange Format (DIF) (G.4)
- e. Control various devices such as terminals, printers, or plotters via device drivers (G.7)
- f. Request operating system services (G.8)
- g. Perform specialized processing by executing system-supplied and user subroutines (G.9)
- h. Allowing certain globals to prevail throughout a user session (G.10)
  - (1) Command line options (G.10.a)
  - (2) Module transfer (G.10.b)

- (3) Classification markings (G.10.c)
- (4) Report titles and modifying them (G.10.d)
- (5) Clearing specific commands (G.10.e)
- (6) Size of text (G.10.f)
- (7) Color of text (G.10.g)
- i. Color processing (G.11)
- j. User control of operating environment attributes (G.12)
- k. Identifying GIPSY's collective input statements (G.13)
  - (1) PCS (G.13.a)
  - (2) Clear PCS (G.13.b)
  - (3) Save PCS (G.13.c)
  - (4) RETURN statement (G.13.d)
- l. Identify and save GIPSY's internal data structures (G.14)
  - (1) FDT (G.14.a)
  - (2) QDF (G.14.b)
  - (3) QDT (G.14.c)
  - (4) DAFC (G.14.d)
  - (5) GDS (G.14.e)
- m. Executing user-supplied subroutines (G.15)
- n. Executing other TSS or JDAC commands (G.16).

### 3.2 CSCI Capability Requirements

The following subparagraphs identify the capability requirements that the Internal Processing CSCI shall satisfy. The CSCI operates in two states--assisted or unassisted--which refer to whether or not a fully functional, GUI is being used. Each state also possesses two modes--local and remote. A correlation of the CSCI's capabilities to both states and their modes is depicted in table 3-1.

Table 3-1. Mapping of States/Modes to Capabilities

---

STATE	MODE	CAP-7.1	CAP-7.2	CAP-7.3	CAP-7.4
ASSISTED	LOCAL	●	●	●	●
	REMOTE		●		●
UNASSISTED	LOCAL	●	●	●	●
	REMOTE	●	●	●	●

---

3.2.1 Operating System Tools (CAP-7.1). This capability provides access to tools developed to provide commonly-used operating system functionality to the rest of the system. The individual tools group several low-level Unix functions together to provide enhanced and more sophisticated services. As such, duplication of similar tools throughout MAGIC is eliminated and software reliability is enhanced.

This capability satisfies the following functional requirements:

- a. Perform file management (G.1)
- b. Request operating system services (G.8)

3.2.2 Pathname Manipulation (CAP-7.2). This capability provides services related to processing pathnames to files. As such, it is a specialized string manipulation geared to understanding and parsing the user input strings comprising file pathnames. As a system utility, this capability supports the Human Interface CSCI.

This capability satisfies the following functional requirements:

- a. Perform file management (G.1)
- b. Control input/output operations (G.2)
- c. Identifying GIPSY's collective input statements, specifically the PCS (G.13.a)
- d. Identify and save GIPSY's internal data structures, specifically the FDT (G.14.a).

3.2.3 String Utilities (CAP-7.3). This capability provides commonly-used string scanning and manipulation functions to the rest of MAGIC. services related to processing pathnames to files. As such, it is a specialized string manipulation geared to understanding and parsing the user input strings comprising file pathnames. As a system utility, this capability supports the Human Interface CSCI.

This capability satisfies the following functional requirements:

- a. Identifying GIPSY's collective input statements (G.13)
  - (1) PCS (G.13.a)
  - (2) Clear PCS (G.13.b)
  - (3) Save PCS (G.13.c)
  - (4) RETURN statement (G.13.d)

- b. Identify and save GIPSY's internal data structures (G.14)
  - (1) FDT (G.14.a)
  - (2) QDF (G.14.b)
  - (3) GDS (G.14.e)
- c. Describe data records (B.2)
  - (1) FDT (B.2.a)
  - (2) Augmenting an existing File (B.2.c)
    - (a) Global fields (B.2.c.2)
    - (b) Qualify fields (B.2.c.3)
    - (c) Specific field references (B.2.c.4)
- d. Identify any conditional expressions (B.3)
- e. Identify any arithmetic expressions (B.4)
- f. Modify data, specifically in-line modification (B.6.a)
- g. Manipulate data (B.7)
  - (1) Sort QDF (B.7.c)
  - (2) Qualify data (B.7.d)
- h. Populate a database or a data file (B.8).

3.2.4 Host Communications (CAP-7.4). This capability provides the functionality needed to support MAGIC communications with the H6000 host platform. The types of functionality provided range from simple logon/logoff support to timeout protection to data transfer with its attendant Cyclical Redundancy Check (CRC) processing. The capability is used in both assisted and unassisted states but only in remote mode. By nature of the fact that it supports modem communications, some parts of this capability will be modem-dependent.

This capability satisfies the following functional requirements:

- a. Save and recall all information necessary to start a new GIPSY session from the departure point of the current GIPSY session (G.3)
- b. Convert the qualified data and its internal matrix version to Data Interchange Format (DIF) (G.4)

- c. Control various devices such as terminals, printers, or plotters via device drivers (G.7)
- d. Perform specialize processing by executing system-supplied and user subroutines (G.9)
- e. Allowing certain globals to prevail throughout a user session (G.10)
  - (1) Command line options (G.10.a)
  - (2) Module transfer (G.10.b)
  - (3) Classification markings (G.10.c)
  - (4) Report titles and modification (G.10.d)
  - (5) Clearing specific commands (G.10.e)
  - (6) Size of text (G.10.f)
  - (7) Color of text (G.10.g)
- f. Identifying GIPSY's collective input statements (G.13)
  - (1) PCS (G.13.a)
  - (2) Clear PCS (G.13.b)
  - (3) Save PCS (G.13.c)
  - (4) Return statement (G.13.d)
- g. Identify and save GIPSY's internal data structures (G.14)
  - (1) FDT (G.14.a)
  - (2) QDF (G.14.b)
  - (3) QDT (G.14.c)
  - (4) DAFC (G.14.d)
  - (5) GDS (G.14.e)
- h. Executing user supplied subroutines (G.15)
- i. Executing other TSS or JDAC commands (G.16).

### 3.3 CSCI Internal Interfaces

No internal interfaces have been identified for this CSCI.

### 3.4 CSCI Data Element Requirements

No internal or external data elements have been identified for this CSCI.

### 3.5 Adaptation Requirements

The following subparagraphs specify the requirements for adapting this CSCI to site-unique conditions and to changes in the system environment.

3.5.1 Installation-Dependent Data. There are no specific installation-dependent data requirements needed for adapting this CSCI to site-unique conditions or to changes in the system environment.

3.5.2 Operational Parameters. There are no specific operational parameters needed for adapting this CSCI to site-unique conditions or to changes in the system environment.

### 3.6 Sizing and Timing Requirements

Sizing requirements pertinent to this CSCI are:

- a. A minimum of 8 megabytes (Mb) of Random Access Memory (RAM) shall be required to execute MAGIC.
- b. A minimum of 2 Mb of free disk space shall be required to execute MAGIC.
- c. A minimum of 16 Mb of swap space shall be required to execute MAGIC.

Timing requirements pertinent to this CSCI are twofold:

- a. MAGIC's response to a user's mouse click or a keystroke for a menu or dialog box shall be within a 5-second timeframe.
- b. If the users-input choice requires MAGIC to interface with a COTS package (either launching or processing), system response shall be within a 5 second timeframe. In other words, the users must either receive some sort of acknowledgment that processing is going on or obtain the end result of their selection.

### 3.7 Safety Requirements

This CSCI is a software product and is intended for use in an office environment. As such, there are no applicable requirements regarding potential hazards to personnel, property, and the physical environment.

### 3.8 Security Requirements

MAGIC is released as an unclassified system and all system files released with it are unclassified. However, MAGIC's features may be used to analyze and present classified information from classified databases. Under these circumstances, MAGIC shall provide the facilities to properly label the screen images and the hardcopy reports, but it is and will remain the user's responsibility to safeguard any and all classified information. MAGIC cannot grant access to classified databases unless the user has permission and access to those files.

Security requirements for all hardware suites and configurations capable of executing MAGIC shall remain the same as required for other operational considerations pertinent and applicable to that equipment and environment. Furthermore, the safeguarding of privacy act information also remains the user's responsibility.

Additional requirements regarding integrity requirements are specified in subparagraph 3.10.4 of this specification.

### 3.9 Design Constraints

This CSCI will be developed in accordance with the standards identified in the Software Standards and Procedures Manual (SSPM). MAGIC has very few design constraints due to its utilization of ANSI C, X Windows, and OSF/Motif in functional processing:

- a. Due to usage of the Oracle COTS package for database management processing, MAGIC is constrained to those data types and parameters supported by Oracle's SQL\*Loader package.
- b. Specific tables stored in the Oracle database (on the workstation) as well as specific data files resident on the WWMCCS host are accessible only to the MAGIC user who has created them (or to one who has been given permissions to them by the owner).
- c. Usage of the host-based GIPSY system will introduce a number of limitations that do not apply to a MAGIC user utilizing workstation-based data. Specifically, not all of Oracle's capabilities supported by MAGIC in local mode can be supported by MAGIC's interface to GIPSY due to inherent differences between the two systems (Oracle and GIPSY). The user must be at least somewhat aware of GIPSY concepts and terminology which is different (e.g., File Descriptor Table (FDT) and Index File) and not all functionality can be supported (e.g., very limited Oracle GROUP functionality).
- d. Usage of a modem for host access will have definitive impacts related to both how and how fast MAGIC can access the host, retrieve the data, and make it available to the MAGIC user on the workstation. Some software developed for the modem will be modem-specific and some

will be inapplicable when MAGIC is transitioned to a direct host communications connection. The processing speed by which MAGIC users can receive response from the host and obtain their data is directly linked to modem speed (currently 2400 baud) and access availability (via Defender).

- e. Target workstation hardware and operating system specifics are still changing at the time of writing this SRS. Since a prototype is being developed on a Sun Scalable Processor Architecture (SPARC) station and the target is presumed to be the Macintosh IIcx, the design is limited to those aspects common across the platforms wherever possible.
- f. The utilization of the Wingz COTS package to perform nearly all business graphics-related processing introduces several design constraints. Currently, nearly all of the constraints noted below arise from the fact that MAGIC is being developed on the Sun SPARCstation and the Wingz version (Version 1.0) for the Sun platform was designed for execution in the SunView environment. Since MAGIC has been designed for the X Windows environment, a method was found that permits the execution of Wingz under the X11/NeWS server with the following design constraints:
  - (1) The "look and feel" of Wingz is not consistent with MAGIC's Motif-based "look and feel."
  - (2) The help text available with Wingz (in Version 1.0) cannot be modified.
  - (3) The menu bar title cannot be modified.
  - (4) The proper import of data into Wingz can be guaranteed only by using an assisted query.
  - (5) Curve graphs, Gantt charts, and histograms are not directly supported by Wingz
  - (6) Wingz requires a PostScript-capable printer or Hewlett-Packard Graphic Language (HPGL) plotter to print.
  - (7) The experimental interface to the X11/NeWS server may cause unpredictable results.
  - (8) The code generated to support both the X11/NeWS server execution method may not be portable to other environments.

### 3.10 Software Quality Factors

The following subparagraphs specify the software quality factors or "fitness for use" characteristics that are required for the Internal Processing CSCI.

They are divided into 11 categories: correctness, reliability, efficiency, integrity, usability, maintainability, testability, flexibility, portability, reusability, and interoperability.

3.10.1 Correctness Requirements. The requirements contained in this subparagraph specify the extent to which the CSCI is expected to satisfy its specifications and fulfill the user's mission objectives. The correctness requirements are:

- a. The software shall be traceable. The functionality of the CSCI must possess a clear linkage from the requirements to the implementation with respect to the specific development and operational environment.
- b. The software shall be consistent. The contractor is required to provide uniform design and implementation of techniques and notation.
- c. The software shall be complete. The functionality of the CSCI must provide a full implementation of the functions required.

3.10.2 Reliability Requirements. The requirements contained in this subparagraph specify the extent to which the CSCI is expected to perform its intended functions with required precision. The reliability requirements are:

- a. The error tolerance of the software shall be 2 percent. The CSCI is required to provide continuity of operation at least 98 percent of the time.
- b. The software shall be consistent. The contractor is required to provide uniform design and implementation of techniques and notation.
- c. The software shall be accurate. The software must provide the user's required precision in calculations and outputs within the limitations of the various COTS packages utilized.
- d. The software shall be simplistic. The functions of the CSCI must be implemented in a most understandable manner and avoid those coding/implementation practices that increase complexity.

3.10.3 Efficiency Requirements. The requirements contained in this subparagraph specify the amount of computing resources and code required by the CSCI to perform its functions. The efficiency requirements are:

- a. The execution efficiency of the software shall be in accordance with the timing requirements of paragraph 3.6.
- b. The storage efficiency of the software shall be in accordance with the sizing requirements of paragraph 3.6.

3.10.4 Integrity Requirements. The requirements contained in this subparagraph specify the extent to which access to the CSCI's software or data

by unauthorized persons should be controlled. The integrity requirements are:

- a. The CSCI shall be access controlled. However, due to the nature of MAGIC's design, access control functions are provided by the Human Interface CSCI (refer to Volume I of this SRS).
- b. The software shall be access auditable. Some methodology must be provided for an audit of the access of both software and data.

3.10.5 Usability Requirements. The requirements contained in this subparagraph specify the effort required to learn, operate, prepare, input, and interpret the output of this CSCI. The usability requirements are:

- a. Training for the use of this CSCI shall be provided as required through normal User Support activities which include functional demonstrations. Formal training is not required at this time due to the requirements for user-friendliness and usability satisfied by the Human Interface CSCI (refer to Volume I of this SRS).
- b. The software shall be communicative and provide useful inputs and outputs which can be assimilated by the user. Although much of this requirement will be met by the functionality of the Human Interface CSCI (refer to Volume I of this SRS), the software of this CSCI must also be communicative wherever appropriate.
- c. The software shall be operable. A smooth transition from current GIPSY operations as well as initial familiarizations with the Unix-based workstation must be provided wherever appropriate.

3.10.6 Maintainability Requirements. The requirements contained in this subparagraph specify the effort required to locate and fix an error in the operational software. The maintainability requirements are:

- a. The software shall be consistent. The contractor is required to provide uniform design and implementation of techniques and notation.
- b. The software shall be simplistic. The functions of the CSCI must be implemented in a most understandable manner and avoid those coding/implementation practices that increase complexity.
- c. The software shall be concise. Functions must be implemented with a minimum amount of code.
- d. The software shall be modular. The modularity of the CSCI shall be designed and implemented using four major attributes:
  - (a) Cohesiveness refers to the functional strength of a module, or how single-minded a module is. The modules shall strive for high cohesion (functional) wherever possible although mid-range cohesion is acceptable. The seven types of module cohesion are:

- (1) Coincidental cohesion (WORST)
  - (2) Logical cohesion
  - (3) Temporal cohesion
  - (4) Procedural cohesion
  - (5) Communicational cohesion
  - (6) Informational cohesion
  - (7) Functional cohesion (BEST).
- (b) Coupling refers to the interdependence of modules (i.e., how they communicate with each other). Of the six types of coupling, modules shall strive to employ data coupling wherever possible. The types of module coupling are:
- (1) Content coupling (WORST)
  - (2) Common Coupling
  - (3) External Coupling
  - (4) Control Coupling
  - (5) Stamp Coupling
  - (6) Data Coupling (BEST).
- (c) Complexity refers to the logical or control flow complexity of any given module. Modules shall be designed with low complexity since they will be easier to test and maintain:
- (1) The cyclomatic complexity of a module shall be kept within 10 as determined by McCabe's Cyclomatic Complexity Metric.
  - (2) The size of any module shall be no more than 200 lines of executable code.
- (d) Structure refers to whether or not a program is structured. Modules shall be designed in a structured manner to enhance maintainability as determined by the principles of essential complexity and program "knots":
- (1) The essential complexity of a module shall be 1.
  - (2) Modules shall have 0 "knots." Knots are those places in a program where the control path crosses another.

- e. The software shall be self-descriptive. The software must contain sufficient comments to provide explanation of the implementation of a function.
- f. The software shall be traceable. The functionality of the CSCI must possess a clear linkage from the requirements to the implementation with respect to the specific development and operational environment.

3.10.7 Testability Requirements. The requirements contained in this subparagraph specify the effort required to test the CSCI to ensure that it performs its intended function. The testability requirements are:

- a. The software shall be simplistic. The functions of the CSCI must be implemented in a most understandable manner and avoid those coding/implementation practices that increase complexity.
- b. The software shall be modular. The CSCI must satisfy the requirements of modularity specified in subparagraph 3.10.6 above.
- c. The software shall support instrumentation. All paths must be testable and all input parameters must be boundary testable (as defined in the SQPP).
- d. The software shall be self-descriptive. The software must contain sufficient comments to provide explanation of the implementation of a function.

3.10.8 Flexibility Requirements. The requirements contained in this subparagraph specify the effort required to modify operational software. The flexibility requirements are:

- a. The software shall be modular. The CSCI must satisfy the requirements of modularity specified in subparagraph 3.10.6 above.
- b. The software shall be general. The software should not have input, processing, and output functions mixed in the same modules; all constants should be defined only once; and application and machine-dependent functions should not be mixed in the same modules.
- c. The software shall be expandable. The CSCI must perform logical processing independent of data storage specifications (not commit all available memory capacity) and be extensible in terms of computational functions.
- d. The software shall be self-descriptive. The software must contain sufficient comments to provide explanation of the implementation of a function.

3.10.9 Portability Requirements. The requirements contained in this subparagraph specify the effort required to transfer the CSCI from one

hardware configuration and/or software system environment to another. The portability requirements are:

- a. The software shall be modular. The CSCI must satisfy the requirements of modularity specified in subparagraph 3.10.6 above.
- b. The software shall be self-descriptive. The software must contain sufficient comments to provide explanation of the implementation of a function.
- c. The software shall be machine-independent. The ANSI C code used should be independent of word and character size and the data representation should also be machine-independent. Wherever possible, modules should be free of input/output references.
- d. The software shall be as software system-independent as possible. The CSCI shall utilize only a common, standard subset of ANSI C and should limit dependence on software system utilities and software system library routines wherever possible. If at all possible, there should be no operating system references.

3.10.10 Reusability Requirements. The requirements contained in this subparagraph specify the extent to which the programs of the CSCI can be used in other applications (related to the packaging and scope of the functions that the programs perform). The reusability requirements are:

- a. The software shall be general. The software should not have input, processing, and output functions mixed in the same modules; all constants should be defined only once; and application and machine-dependent functions should not be mixed in the same modules.
- b. The software shall be modular. The CSCI must satisfy the requirements of modularity specified in subparagraph 3.10.6 above.
- c. The software shall be as software system-independent as possible. The CSCI shall utilize only a common, standard subset of ANSI C and should limit dependence on software system utilities and software system library routines wherever possible. If at all possible, there should be no operating system references.
- d. The software shall be machine-independent. The ANSI C code used should be independent of word and character size and the data representation should also be machine-independent. Wherever possible, modules should be free of input/output references.
- e. The software shall be self-descriptive. The software must contain sufficient comments to provide explanation of the implementation of a function.

3.10.11 Interoperability Requirements. The requirements contained in this subparagraph specify the effort required to couple this MAGIC CSCI with another system. The interoperability requirements are:

- a. The software shall be modular. The CSCI must satisfy the requirements of modularity specified in subparagraph 3.10.6 above.
- b. The software shall utilize communications commonality wherever appropriate. The CSCI should use a single module to provide an input interface; a single module to provide an interface for output; and adhere to established protocol standards.
- c. The software shall utilize data commonality. The CSCI should use a single module to perform any data translations and standard data representations should be used.

### 3.11 Human Performance/Human Engineering Requirements

Issues related to human performance and human engineering concerns have been noted and discussed previously in subparagraph 3.10.5 of this specification.

Operational issues are concerned with the hardware and software support environments required for the user. A brief summation of the user's operational needs would include the following:

- a. Access to a Unix-based color graphics workstation that has the Oracle Relational Database Management System (RDBMS) installed on it.
- b. Access to a Unix-based color graphics workstation that has both Motif (Release 1.0.a) and X Windows (Release 11, Version 3) installed on it.
- c. Access to auxiliary devices such as dot matrix printers, Postscript-capable laser printers, floppy disk drives (1.44 Mb), external tape backup units, and external mass storage devices.
- d. Access to the WWMCCS host via xterm on the workstation.

Human error is a final issue related to human engineering requirements. Once Internal Processing has been initiated, errors will be captured by this CSCI's error handling facilities. Error handling will be provided via the Human Interface CSCI (Volume I of this SRS).

### 3.12 Requirements Traceability

A mapping of the engineering requirements in this specification to the functional requirements applicable to this CSCI in the FD is provided in table 3-2. A mapping of the allocation of the CSCI requirements from the FD to the engineering requirements in this specification is provided as table 3-3.

Table 3-2. Mapping of Applicable Requirements to the FD (Part 1 of 8)

## SECTION 4. QUALIFICATION REQUIREMENTS

This section specifies the qualification methods to be used to ensure that the CSCI requirements of sections 3 and 5 have been satisfied.

### 4.1 Qualification Methods

This paragraph discusses the qualification methods to be used to ensure that all requirements of the Internal Processing CSCI have been satisfied. The methods utilized shall satisfy the requirements described in the Software Quality Program Plan (SQPP) and in section 5 (Formal Qualification Testing) of the Software Development Plan (SDP). The specific methods to be utilized are as follows and a qualification cross-reference table appears as table 4-1:

- a. Demonstration - the use of stubs and drivers to permit the functional operation of specific program unit(s) to ensure that the function to be performed is done so correctly.
- b. Test - the execution of specific program unit(s) utilizing test data to ensure that the algorithmic logic performs correctly, in accordance with established test procedures.
- c. Analysis - the verification and interpretation of the results obtained from the various methods described in this paragraph whereby the Quality Assurance (QA) Manager shall analyze the accumulated results to ensure that quality assurance standards are maintained.
- d. Inspection - the visual review of source code and documentation to ensure that both coding standards and documentation guidelines are followed.
- e. Reviews - the use of In-Process Reviews (IPRs), Initial Operational Capability (IOC), and Final Operational Capability (FOC) reviews to ensure that software development fulfills the defined requirements.

### 4.2 Special Qualification Requirements

No special qualification requirements are applicable for this CSCI.

Table 4-1. Qualification Cross-Reference Table

REQUIREMENT NAME	CM IDENTIFIER	SECTION 3 PARAGRAPH	QUALIFICATION	
			METHODS*	LEVEL**
Operating System Tools	CAP-7.1	3.2.1	A, I, R, T	1, 2
Pathname Manipulation	CAP-7.2	3.2.2	A, I, R, T	1, 2
String Utilities	CAP-7.3	3.2.3	A, I, R, T	1, 2
Host Communications	CAP-7.4	3.2.4	A, I, R, T	1, 2

\* Qualification Method

A - Analysis  
D - Demonstration  
I - Inspection  
R - Reviews  
T - Test

\*\* Qualification Level

1 - Configuration Item  
2 - System Integration  
3 - System Installation

## SECTION 5. PREPARATION FOR DELIVERY

The Internal Processing CSCI (CSCI-7) shall consist of all completed FOCs integrated into an operational system along with any corrected deficiencies. The preparation of the CSCI for delivery shall include, but not be limited to, the following (on a Sun workstation):

- a. Recompile and relink all source code and create object and executable files
- b. Provide necessary documentation to support the CSCI
- c. Provide magnetic media (1.44 Mb disks or 1/4" tapes) copies of both source code and executable files in support of the CSCI
- d. Provide a list of all known deficiencies
- e. Provide a listing of all source programs involved in the preparation of the CSCI.

Documentation to be delivered with the CSCI includes the Software Development Folders (SDFs) for the CSCI and a Version Description Document (VDD). Furthermore, that portion of a Software Release Bulletin (SRB) appropriate to the CSCI shall also be produced and delivered.

The release media is UNCLASSIFIED and shall be accompanied by a delivery letter.

**THIS PAGE INTENTIONALLY LEFT BLANK**

## SECTION 6. NOTES

This section contains information of general interest that aids in understanding this specification. Specifically, document references to include both source and issue date are provided as well as a terms and abbreviations paragraph.

### 6.1 Document References

The following references were used in the preparation of this specification:

- a. American National Standards Institute (ANSI), Programming Language C, ANSI X3.159-1989, New York, NY, 16 December 1989
- b. Department of Defense (DOD), Defense System Software Development, Department of Defense Standard, DOD-STD-2167A, Washington, D.C., 29 February 1988
- c. DOD, Software Requirements Specification, Data Item Description (DID), DI-MCCR-80025A, Washington, D.C., 29 February 1988
- d. Joint Data Systems Support Center (JDSSC), Documentation Standards and Publications Style Manual, Procedures Manual (PM) 1-90, Washington, D.C., 1 August 1990
- e. JDSSC, Functional Description for the Graphic Information Presentation System (GIPSY), <reference>, Washington, D.C., 1 February 1988
- f. JDSSC, Software Development Plan (SDP) for the Mapping and Graphic Information Capability (MAGIC), SDP 2-90, Washington, D.C., 1 November 1990
- g. JDSSC, Software Quality Program Plan for the Mapping and Graphic Information Capability (MAGIC) (Draft), <reference>, Washington, D.C., 23 July 1990
- h. JDSSC, Software Standards and Procedures Manual for the JNGG Graphics Program, Technical Memorandum (TM) 405-90, Washington, D.C., 1 December 1990
- i. National Technical Information Service (NTIS), The X Window System, Massachusetts Institute of Technology (MIT)/Laboratory for Computer Science (LCS)/Technical Report (TR)-368, Cambridge, MA, November 1986.

### 6.2 Terms and Abbreviations

The following terms, abbreviations, and acronyms specific to this document are listed below:

ADP ----- Automated Data Processing  
Allocated  
Baseline ----- The initially approved documentation describing an item's  
functional and interface characteristics that are  
allocated from those of a higher level CI; specified by  
MIL-STD-480B

ANSI ----- American National Standards Institute  
AT&T ----- American Telephone and Telegraph, Incorporated  
C ----- The C programming language as specified by ANSI Standard  
X3.159-1989

CAP ----- Configuration identifier prefix used to designate a  
capability  
CI ----- Configuration Item  
COTS ----- Commercial Off-The-Shelf  
CRC ----- Cyclical Redundancy Check  
CSCI ----- Computer Software Configuration Item  
Cyclomatic  
Complexity ----- A software metric that provides a quantitative measure of  
the logical complexity of a program.

DAFC ----- Directive Action File Control; the GIPSY file that holds  
all essential common areas and end-of-memory arrays  
during a GIPSY user session

DCA ----- Defense Communications Agency  
DI ----- Data Item  
DID ----- Data Item Description  
DOD ----- Department of Defense  
DOD-STD ----- Department of Defense Standard  
DTIC ----- Defense Technical Information Center  
FD ----- Functional Description as specified by DID #  
DI-IPSC-80689 of DOD-STD-7935A

FDT ----- GIPSY's File Descriptor Table  
FOC ----- Final Operational Capability  
GIPSY ----- Graphic Information Presentation System  
GUI ----- Graphical User Interface  
HPGL ----- Hewlett-Packard Graphic Language  
H6000 ----- Honeywell 6080 mainframe computer standard at all WWMCCS  
sites

Index File ----- GIPSY's file used to enhance retrieval speeds against  
large, host-based ISP data files

INT ----- Configuration identifier prefix used to designate an  
external interface

IOC ----- Initial Operational Capability  
IPR ----- In-Process Review  
IPSC ----- Information Processing Standards for Computers  
IRS ----- Interface Requirements Specification as specified by DID  
# DI-MCCR-80026A of DOD-STD-2167A

ISP ----- Indexed-Sequential Processor  
I/O ----- Input/Output  
JDSSC ----- Joint Data Systems Support Center  
JN ----- NMCS ADP Directorate

JNG ----- General Applications Division  
 JNGG ----- Information Systems Branch; the OPR for MAGIC development  
 JTSA-P ----- Administrative Control Branch; Pentagon Technical  
                   Resource Center, Room MF612A  
 LCS ----- Laboratory for Computer Science; part of MIT  
 MAGIC ----- Mapping and Graphic Information Capability  
 Mb ----- Megabyte; 1,024,000 bytes of data  
 MCCR ----- Mission-Critical Computer Resources  
 MIL-STD ----- Military Standard  
 MIT ----- Massachusetts Institute of Technology  
 Module ----- In the MAGIC environment, a C language function  
 Motif ----- A user interface toolkit built on the X Window System and  
                   marketed by the Open Software Foundation  
 NMCS ----- National Military Command System  
 NTIS ----- National Technical Information Service; formerly the  
                   National Bureau of Standards  
 OPR ----- Office of Primary Responsibility  
 OSF ----- Open Software Foundation  
 PCS ----- GIPSY's Process Control Statement  
 PM ----- Procedures Manual  
 QA ----- Quality Assurance  
 QDF ----- GIPSY's Qualified Data File  
 QDT ----- GIPSY's Qualified Data Table  
 RAM ----- Random Access Memory  
 Rational ----- The R1000 Ada language-based development platform  
                   manufactured and sold by Rational Corporation  
 RDBMS ----- Relational Database Management System  
 RIN ----- Configuration identifier prefix used to designate an  
                   internal interface requirement  
 SDF ----- Software Development Folder  
 SDP ----- Software Development Plan as specified in DID #  
                   DI-MCCR-80030A of DOD-STD-2167A  
 SPARC ----- Scalable Processor Architecture  
 SQL ----- Structured Query Language as defined in ANSI X3.135-1986  
 SQPP ----- Software Quality Program Plan as specified in DID #  
                   DI-QCIC-80572 of DOD-STD-2168  
 SRB ----- Software Release Bulletin  
 SRS ----- Software Requirements Specification as specified by DID #  
                   DI-MCCR-80025A of DOD-STD-2167A  
 SSPM ----- Software Standards and Procedures Manual as specified by  
                   DID # DI-MCCR-80011 of DOD-STD-2167  
 TM ----- Technical Memorandum as specified by JDSSC PM 1-90  
 TR ----- Technical Report  
 TSS ----- Honeywell's Time Sharing System  
 Unix ----- A multi-tasking operating system from AT&T that runs on a  
                   wide variety of computer systems from micro to mainframe  
 VDD ----- Version Description Document as specified by DID #  
                   DI-MCCR-80013A of DOD-STD-2167A  
 WWMCCS ----- Worldwide Military Command and Control System  
 X Windows ----- A device-independent and network-transparent windowing

protocol for graphics workstations developed at MIT and  
copyrighted in 1984

13. ABSTRACT (Maximum 200 words)  This Software Requirements Specification (SRS) specifies the engineering and qualification requirements for the Internal Processing CSCI of the Mapping and Graphic Information Capability (MAGIC). Furthermore, this specification will be used as the basis for the design and formal testing of that CSCI.  The SRS is divided into three major sections. These sections cover Engineering Requirements (Section 3), Qualification Requirements (Section 4), and Preparation for Delivery (Section 5).
