UPDATE OF THE U.S. ARMY RESEARCH INSTITUTE'S LONGITUDINAL RESEARCH DATA BASE OF OFFICERS

Background

The Officer Longitudinal Research Data Base (OLRDG) was conceived by the U.S. Army Research Institute for the Behavioral and Social Sciences (ARI) to make longitudinal data for current and future research efforts regarding U.S. Army officers readily available. The historical perspective provided by the OLRDB enables researchers to examine the personnel, pre- and post-commissioning training, and field performance information for officers.

The OLRDB is currently organized as six data sets related to each other by a unique identifier for each soldier. These include the OLRDB Core and Longitudinal data sets containing critical information about former and current active duty officers; Reserve Officer Training Corps (ROTC) and United States Military Academy (USMA) data sets containing pre-commission data; and the Automated Instructional Management System (AIMS) Data Set containing post-commissioning data on performance in training.

Objective

The objective of this work was to update all of the OLRDB data sets except the Core and Longitudinal data sets. The ROTC Commission and Advanced Camp data sets, the AIMS Data Set, and the USMA Data Set were to be updated with 1990 data. Using selected data elements from the source files and available documentation, the following tasks were to be accomplished for each of the data sets.

- 1. Add the 1990 source data to the existing OLRDB.**
- 2. Check all data elements for accuracy (e.g., range of values and consistency across data elements) and correct within the limits of available documentation and logic, as appropriate.**
- 3. Change data element and code names to reflect changes in the source data.**
- 4. Protect the privacy of individual records through the application of the OLRDB encryption procedure to encode personal identifying information.**
- 5. Produce descriptive statistics for the data elements contained in the newly updated OLRDB data sets.**

ROTC Update Procedures

The Reserve Officer Training Corps (ROTC) provides a major source of pre-commission and commissioning information for the Officer Longitudinal Research Data Base (OLRDB) from their Advanced Camp and Cadet Master files. These data are captured as part of the OLRDB in two data sets, the Advanced Camp and Commission data sets. The current OLRDB ROTC data sets include data from 1982 through 1990.

The ROTC data sets were designed to provide a snapshot of the final record for ROTC participants at Advanced Camp and the commissioning data for new officers from the ROTC program. The update procedures, in this case, do not add new data to existing records, rather existing records are replaced if more current data are found; new individuals are also added to the data set. The update process consists of the following procedures:

1. Determine the location of OLRDB data elements in the ROTC files.
2. Extract the OLRDB data elements from the ROTC files.
3. Execute the update program to create the updated ROTC data sets.
4. Encrypt the social security number of the updated ROTC data sets.

Determine the Location of OLRDB Data Elements in the ROTC Files

The history of the OLRDB ROTC data sets show that all data elements encountered on the source files were initially included in the ROTC data sets. These data were accepted with minimal editing because documentation for these years was limited at best. For the 1986-1989 update, ARI recommended eliminating some of the redundant data elements. The specific peer rating fields were dropped because they were summarized in another field. A few other variables created with the initial data were also dropped because they were never documented and were not present in later source file years.

Identify Changes. The documentation for the 1990 file of ROTC Advanced Camp and Cadet Master data was once again limited in substance. The record layouts showed the data element name and location but the field and code descriptions were sometimes missing and the field positions were not always accurately documented. After reviewing the record layouts, it became clear that several data elements had changed, were replaced, or eliminated. The documentation provided was insufficient to fully understand the transformation. Additional information about specific fields was solicited from ROTC and all data fields were properly identified. Mr. Claude Wilson provided assistance with the camp and commission questions concerning data element definitions and record layout changes.

A significant effort was made to match the 1990 data to the data already on the OLRDB ROTC Data Sets. Where matches could accurately be determined, edits were constructed to bring historical data into conformity with current data. In some cases data had to be changed from character to numeric or vice versa. Where the matches were unclear or not able to be determined, new data elements were created for current year data.

Extract the OLRDB Data Elements From the ROTC Files

In the previous update process, SAS frequency counts identified a small group of land navigation scores on the 1988 and 1989 Advanced Camp files which were documented as packed numeric fields. However, it was discovered that these fields did not contain packed values readable on the IBM mainframe. After discussions with the ROTC programmers, it was determined that some programming by ROTC staff would be required to correct the situation. Due to time constraints, new data could not be collected therefore, these fields are missing for the two years in which the data were not readable.

The number of fields that were stored in a packed format increased in the 1990 ROTC source file. There were approximately 23 land navigation fields that were documented as packed numeric. As in the past, these fields were not readable on the IBM mainframe. The ROTC programmer was contacted to discuss the packed values and a hexadecimal dump of the packed fields clearly showing the invalid data in these fields was sent to ROTC. After reviewing the hexadecimal dump, the ROTC programmer realized that when the source files were created the packed fields did not convert properly from ASCII to EBCDIC. The programmer unpacked the fields before converting the file from ASCII to EBCDIC and sent the new source file in time for the 1990 update process. All fields in the new source file were readable.

The extraction of the OLRDB data elements was performed using SAS programs for each ROTC file. Each program contained special coding to handle unique requirements or data configurations (i.e., record layout and code changes). After the data extraction was complete, SAS frequencies were run to determine the range of values actually contained on each file.

Execute the Update Program to Create the Updated ROTC Data Sets

The update program was prepared to deal with the file year differences and combine the 1982-1989 data with the 1990 data. Where more than one record was found for an individual, older records were replaced with current records. The ROTC Commission Data Set and the Advanced Camp Data Set each had five records replaced with current data. ROTC records were matched with the OLRDB Core Data Set and a flag was set to indicate whether or not the cadet was found in the updated OLRDB Core Data Set. Old values were recoded to coincide with current values and range checks performed when applicable. SAS frequencies were then run on the final data sets. See Table 1 for the number of cadets in the Advanced Camp Data Set and Table 2 for the number of officers in the Commission Data Set by year.

AIMS Update Procedures

The Automated Instructional Management System (AIMS) maintains information on courses offered by the Training and Doctrine Command (TRADOC) of the U.S. Army. This information was included in the Officer Longitudinal Research Data Base (OLRDB) to provide data regarding officer training and career development as well as pre-commissioning information for officers from Officer Candidate School (OCS). AIMS data were collected from participating TRADOC sites and summarized for use in the OLRDB. The current AIMS Data Set includes data from 1982 through 1990.

The AIMS data set was designed to provide a summary of Army training for each officer on the OLRDB. Courses provided by TRADOC were categorized as OCS, Officer Basic, Officer Advanced, and Technical (all other). The update procedures merge new course data with existing OLRDB AIMS data by category to produce a single record of AIMS history for each officer. The update process consists of the following procedures:

1. Collect AIMS data from TRADOC sites.
2. Extract course level data and classify courses.
3. Execute the update program to create the updated AIMS Data Set.
4. Encrypt the social security number of the updated AIMS Data Set.

Collect AIMS Data From TRADOC Sites

The COTI made initial contact with the appropriate TRADOC and SYSCON coordinators to obtain authorization for the OLRDB data request. Each of the participating TRADOC sites was then contacted to request a current course list. Because it was sometimes difficult to establish which courses were offered to and attended by officers, the academic records office at the site was contacted, in some cases, to confirm the course list.

Request information and blank data tapes were then distributed to each TRADOC site. The request included the list of officer courses and instructions on how to use the Historical Tape Transfer program, which was developed by SYSCON to extract course data from the AIMS system. UPS delivery slips for two day return delivery were also included to enhance the turnaround time.

Several of the sites responded promptly to the data request, but there were various delays and problems with others, as expected. Some of the data files received were unreadable and had to be replaced. Some sites were slow in responding to the request and required many follow up calls to produce the desired data. We were successful, however, in the final accumulation of all officer data known to be available from 16 TRADOC sites.

Three of the 16 sites, Fort Rucker, Fort Leonard Wood, and Sam Houston, had officer course data available for the first time in 1990. Fort Belvoir, which had previously offered officer courses, changed in 1990 and currently offers only enlisted courses. As of 1990, the Fort Belvoir officer courses are offered at Fort Leonard Wood.

The course listings showing the requested courses offered by each site for officers are shown in Appendix C and the contact points for each site are listed in Appendix D. Officer courses new to the AIMS Data Set in this update are marked with an asterisk.

Extract Course Level Data and Classify Courses

Each data tape received was copied and verified to ensure that all data were copied properly. Duplicate records were dropped as were records which described the events associated with each course. Only course level data variables were retained. No changes were made to the record layout of the AIMS data so existing programs supplemented with additional course codes could be used.

It was necessary to classify each new course according to OLRDB categories: OCS, Officer Basic, Officer Advanced, or Technical (all other). In some cases, the academic records office was contacted to make this determination. These classifications were then incorporated into the update procedure.

The specific number of course/student records collected for each site and incorporated into the data base are shown in Table 3:

**Table 3

Execute the Update Program to Create the Updated AIMS Data Set

Changes were made to the existing update procedures to include the new course codes and classifications. These procedures validated data variables and recoded invalid data (e.g., rank), where possible. Army standard scores were computed and course standing was calculated in relation to other commissioned officers in the course. A flag was set to indicate whether an officer had taken a course more than once.

One function performed in the update procedure was to match the course participants that have unknown ranks with the OLRDB Core Data Set population to determine if they were, in fact, commissioned officers. This marks a change from the initial AIMS effort which used the Officer Master File (OMF), maintained by PERSINSCOM, as the resource file. Since the Core Data Set had been updated, it was the most reasonable source for the match.

It seemed likely that some sites would send information which they had sent for the previous update of the OLRDB since the extract can be made from any historical AIMS file. The site operator has complete control over which tapes are used to create the file sent. Therefore, the newly collected and extracted course data were matched with data previously collected and any records which were complete duplicates were removed. This unique set of records was then processed through the final step which classifies the data and creates the final AIMS data set.

Encrypt the Social Security Number of the Updated AIMS Data Set

Individual privacy was protected by replacing the social security number with a unique identification number, the matchcode. This encryption process was performed using the same procedure used for the other OLRDB data sets. The COTR has a copy of this procedure with associated documentation.

AIMS Data Set Summary

A total of 68,092 officers are represented in the OLRDB AIMS Data Set from 1985 through 1990. Each record in this data set contains 82 data elements. Each officer has one or more courses described on the AIMS record by category: OCS, Officer Basic, Officer Advanced, or Technical (all other). The data are available in SAS format, and data element codes are included in an online format library. (See Appendix E for a list of the data elements.) The data set name and characteristics are shown below:

USMA Update Procedures

The United States Military Academy (USMA) is a major source of pre-commission information for the Officer Longitudinal Research Data Base (OLRDB) and provides data from their Cadet Master files. A SAS data set was created to capture these data as part of the OLRDB. The current OLRDB USMA Data Set includes data from 1982 through 1990.

The USMA Data Set was designed to provide a snapshot of the final record for USMA graduates. The update procedure, in this case, does not add new data to existing records, rather, in the rare instance where an individual appears more than once, the existing records are replaced. The update process consists of the following procedures:

1. Determine the location of OLRDB data elements in the USMA files.
2. Extract the OLRDB data elements from the USMA file.
3. Execute the update program to create the updated SAS USMA Data Set.
4. Encrypt the social security number of the updated USMA Data Set.

Determine the Location of OLRDB Data Elements in the USMA File

The cadet file provided by USMA contains only a small number of data elements in a fixed format which has remained the same since the initial creation of the data set. The data placement and content were verified upon receipt of the source file from USMA.

Extract the OLRDB Data Elements From the USMA File

The 1990 data received from USMA were converted from character format to SAS using all data fields present on the source file. SAS frequency counts were performed to check data element code values.

Execute the Update Program to Create the Updated USMA Data Set

The procedure used to create the initial USMA data set was developed by ARI. These same procedures were used for the subsequent updates. The update process adds the new graduate records and also replaces the records of any individuals already on the existing USMA Data Set. Two existing records were replaced with current data in the 1990 update. The update process edits invalid data element codes by setting invalid codes to missing values. The Field of Study data element is recoded to create a new data element containing category groupings. Any new or changed code values were incorporated into the associated SAS format library. The number of graduates on the USMA Data Set, by year, are shown in Table 4.
