## ABSTRACT

The models developed in this analysis provide a tool for Marine officers who need a quick, reliable promotion predictor to assist in career assignments or choices. These models use several easily obtained factors to forecast selection rates for promotion to Major, Lt.Colonel and Colonel. Specifically, factors which can be used to predict selection rates to all the aforementioned paygrades are MARITAL STATUS, ATTENDANCE AT AN APPROPRIATE LEVEL PROFESSIONAL SCHOOL, and ATTAINMENT OF A POSTGRADUATE DEGREE. Duty assignment, commissioning source, and personal awards are significant factors, also, but not universally. Significant by their lack of influence on selection rates are RACE, SEX, and COMBAT EXPERIENCE. Other factors also studied but not mentioned in the abstract are discussed in the body of this analysis.

## I. INTRODUCTION

The purpose of this analysis is to provide a tool for use by officers assigned to the Officer Promotion Branch, HQMC, or any Marine officer who has a need to determine officer selection rates. Traditionally, an officer's service history is studied, complete with fitness report analysis, to provide insight into the competitiveness of a particular officer. The models developed in this study, however, use several significant factors in predicting officer selection rates without reconstructing an officer's fitness report history, and can provide timely forecasts of selection rates. The selection process is described in the first chapter of this thesis. It is a long process, involving numerous officers and a great deal of discussion by the members of the promotion board. Prior to convening the board, however, the officer in the promotion zone (see definition, p. 3) may want an indication of his chances for selection, as may the MOS Monitor/OccField Sponsor. These models can serve as timely aids to these decision makers prior to the board and prior to career decisions affecting the officer.

Variables having an impact on selection rates that remain consistent regardless of rank are MARITAL STATUS, ATTENDANCE AT AN APPROPRIATE LEVEL PROFESSIONAL SCHOOL, and ATTAINMENT OF A POST-GRADUATE DEGREE. Duty Assignment and Commissioning Source serves also as contributing factors to varying degrees, depending on the rank to which an officer is "in zone."

The most notable factors not having an effect on selection rates are RACE, SEX, and COMBAT EXPERIENCE. Other factors were studied and are included in the body of this analysis, but do not warrant mention at present.

## II. BACKGROUND

The United States Marine Corps operates three promotion systems: a system for active duty officers based on the Defense Officer Personnel Management Act (DOPMA), a system for reserve officers not on active duty based on Title 10 U.S. Code Chapter 549, and a very large system for the enlisted force based on Navy Department regulations as well as Marine Corps orders and policies. Criterion differ slightly for each promotion category, but for active duty officers, the criterion for selection is simply "best qualified for service in the higher grade." [Ref. 1]

The number of officers who may be selected is determined by the annual promotion plan in which planners compare authorized strengths and projected losses to predict vacancies. This 'zone size' is further determined by DOPMA regulated 'promotion opportunity,' i.e., DOPMA requires a certain percentage of officers be selected for promotion. The board then selects officers in advance in order to fill authorized vacancies as they become available.

### A. DEFINITIONS [Ref. 2]

**Promotion Zone.** A promotion eligibility category consisting of officers on the active - duty list in the same grade and competitive category who, in the case of officers below colonel, have neither failed of selection for promotion nor been removed from a list of officers who have been recommended for promotion to that grade and are senior to the junior officer in the promotion zone eligible for consideration for promotion to the next higher grade.

**Above Zone.** Officers who have been previously considered in the promotion zone and not selected.

**Below Zone.** Officers eligible for consideration but junior to the junior officer in the promotion zone.

**Promotion Opportunity.** A percentage based on the following equation for each grade and competitive category:

$$\text{Promotion Opportunity} = \frac{\text{\# of officers to be selected}}{\text{\# of officers in the promotion zone}}$$

**Competitive Category.** A category established to provide for separate promotion consideration and career development of groups of officers possessing related skills and experience necessary to meet the mission objectives of the Department of the Navy.

**Grade.** A step of degree, in a graduated scale of officer or military rank, that is established and designated as a grade by law or regulation. Also, a grade to which a permanent appointment has been tendered by competent authority and accepted by a member of the Armed Forces.

**Promotion Flow Points.** Required years of commissioned service to be eligible for promotion to the next higher paygrade. Promotion Flow Points are established by DOPMA.

**Precepts.** Formally written documents that reduce all laws and regulations to simple guidance. They also serve as vehicles for the Secretary of the Navy to communicate the special needs of the Marine Corps to the board. Among other things, the precept sets the number of officers that may be selected as well as the number that can be picked below zone, establishes selection criterion, and provides information on shortages within occupational fields.

## **B. PROMOTION BOARD DESCRIPTION**

The membership of the promotion board is not revealed until the boards are convened. Boards are composed of officers at least one paygrade senior to the officers being considered, and represent all occupational fields and commands from all geographic regions. If women are considered for promotion, a woman officer should also sit on the board.

### **C. MASTER PERSONNEL FILE**

The primary tool of the selection board is the master personnel file. The master personnel file is a microfilm record of every piece of correspondence produced or received by Headquarters Marine Corps on an individual Marine. There are three parts to this file: fitness reports, commendatory or derogatory material, and miscellaneous administrative material. The board normally concerns itself only with fitness reports and commendatory or derogatory material. The fitness reports are summarized for each officer on a Master Brief Sheet. All pertinent information from the officer's file is summarized in tabular fashion. A board member (briefer) verifies all information on the master brief sheet, and briefs the officer's case from those files.

### **D. THE BRIEF AND EXECUTIVE SESSION**

The briefer is to provide the total picture of every Marine he is assigned. The briefer carefully reviews all fitness reports, noting significant comments of reporting seniors and reviewing officers in the remarks and observations column of the master brief sheet. Board members may question or request amplifying information on each officer being briefed. Such additional information would include awards and decorations, civilian and military education, and fitness report Section C narrative data to reinforce remarks on the officer's master brief sheet. The board then votes on each officer's selection. [Ref. 1] Officers are selected by majority vote.

### III. DATA

To develop the data base, I selected all the officers in the primary zone for promotion in fiscal years 1986 through fiscal year 1992. Each board is presented with a precept, which might produce observations which are peculiar to that particular year. Using a period of 7 years, I hoped to do away with any singular differences between boards and show how the trend towards selection would be affected by the models I developed.

Data for this analysis had to be available and obtainable from existing USMC data bases, and it had to adequately describe the officer in the primary zone. Ideally, performance data would be used to determine selection rates, but gathering data of that source would be time prohibitive. It would involve gaining access to individual Master Brief Sheets, quantifying each Fitness Report Section B mark, and identifying certain key words and phrases as positive or negative, and assigning a value to the number and quality of the narrative in the Fitness Report. I ignored performance in this analysis and concentrated on variables that could be more readily made available. We will see, however, that performance is a basis for a number of the variables chosen for the models.

I determined that the following categories would be useful in describing the officer in the promotion zone:

**Fiscal Year:** FY 86 - 92 were chosen. As the most recent boards, they would reflect current policy and would make the model valid for the near term.

**Paygrade:** The paygrades the officer was being considered for promotion to were 04, 05, and 06, i.e., to major, to lt.col, and to colonel.

**Selected:** Was the officer selected for promotion to the next higher paygrade?

**SSN:** Used to identify each officer when obtaining records from the HQMC data base. Privacy act regulations do not allow release of these records with SSN included. SSN was not used in the analysis.

**Marital Status:** Married, single, divorced, legally separated, widowed, annulled were the codes in the data base to describe the officer's marital status.

**Race/Ethnic:** Caucasian, Black, Hispanic, Asian Pacific Islander, Native American, and Other were the categories used to describe the background of the officer. Less than 6% of the entire population was nonwhite, which necessitated combining the nonwhite groups into a separate category.

**Sex:** Male or Female. Less than 4% of the population is female.

**Primary MOS:** Military Occupational Specialty is the specialty the officer is assigned. There are over 60 PMOS designators in the MOS Manual, so these were grouped by category.

**Billet MOS:** The billet to which the officer was assigned at the time of the board. Billet MOS may not match Primary MOS, depending on the duty station and assignment of the officer.

**PMCC:** Primary Monitor Command Code is the code which describes the unit to which the officer is assigned. Each unit in the Marine Corps has its own PMCC.

**Source of Entry:** The commissioning source of the officer. There are numerous different sources ranging from the service academies to direct commissioning programs.

<b>Education Level:</b>	Code which describes the level of education attained by the officer. Ranges from undergraduate degree to post doctoral work.
<b>GCT Score:</b>	General Classification Test Score which is on a 160 point scale. All marines take the test. A score of 100 is considered the Marine Corps average, with officers scoring above that.
<b>Personal Awards:</b>	The numerous personal awards (medals) awarded for professional achievement. Range from the Navy Achievement Medal to the Congressional Medal of Honor.
<b>PME:</b>	Professional Military Education. Appropriate level school for an officer based on rank and experience. Selection for school is competitive.
<b>Combat:</b>	Combat service codes for hostilities from Vietnam to the Persian Gulf are included.
<b>DOR:</b>	Date of rank. The date the officer was promoted to his present rank.
<b>Year of Commission:</b>	The year the officer was initially commissioned.

The data was provided (in ASCII format) by the Management Information (MI) Branch at HQMC. Of particular importance is the fact that the data presents a "snapshot" of the officer when the board convenes. The Duty Station is that one where an officer is assigned when the board convenes. Tracking the career path of each officer to determine questions concerning assignment to a specific billet is possible, but well beyond the scope of this analysis. A sample of the raw data is shown in Appendix [I]. The data itself is on the NPS mainframe under my file: "LONGALL DATA B1." The SAS routine I used to sort the raw data into a format that could be analyzed is shown in Appendix [H].

The size of the data exceeded one megabyte of storage space. To facilitate model building and speed up the analysis, I built models and performed analysis for each paygrade. As previously mentioned, individual year groups can be analyzed, but I chose to analyze the data over the entire span of the year groups to model trends.

Closer examination of the data shows numerous dimensions for each variable chosen, especially PMOS, MCC, and Personal Awards. Analysis of the data plus personal experience in the Marine Corps, led me to reduce the number of dimensions to a manageable number and assign new names to those dimensions.

The variables (and dimensions) are summarized below:

VARIABLE	DIMENSIONS	REMARKS
SSN	1 PER OFFICER	NOT ANALYZED
FISCAL YEAR (FY)	1986 - 1992	INITIAL ANALYSIS ONLY
PAYGRADE (PG)	O3, O4, O5	ANALYZED SEPARATELY
MARITAL STATUS	MARRIED (M) SINGLE (S)	COMBINED ALL TO EITHER MARRIED OR SINGLE
RACE	WHITE NONWHITE	SMALL NONWHITE POPULATION ALL IN ONE CATEGORY CALLED NONWHITE
SEX	MALE (M) FEMALE (F)	SMALL FEMALE POPULATION, < 4%

VARIABLE	DIMENSIONS	REMARKS
OCCFIELD	COMBAT ARMS FIX WING PILOT RTRY WING PILOT NFO (GIB) SUPPORT	MAJOR GROUPING OF OCCUPATIONAL FIELDS (PMOS)
DUTY STATION	FLEET MARINE FORCE (FMF) NON FMF QUANTICO HQMC RECRUITING DUTY	MAJOR GROUPING OF DUTY ASSIGN- MENTS. ANALYSIS OF ALL MCCs LED TO THE CHOICES.
SOURCE OF COMMISSION	USNA ROTC OCS	THREE PRIMARY COMMISSIONING SOURCES. OCS INCLUDES ALL SOURCES NOT IN USNA OR ROTC.
DEGREE	ADVANCED UNDERGRADUATE	ADVANCED IS A MASTERS DEGREE OR HIGHER
MEDALS	2 OR MORE LESS THAN 2	ANALYSIS SHOWED THAT 2 OR MORE MEDALS WAS SIGNIFICANT
APPROPRIATE LEVEL SCHOOL (ALS)	YES NO	ATTENDANCE AT A FORMAL MILITARY SCHOOL AT THAT PAYGRADE
COMBAT	YES NO	INCLUSION OF A COMBAT SERVICE CODE. SERVICE FROM VIETNAM TO SAUDI INCLUDED

The transformed data was compiled using the SAS routine in Appendix [H]. A sample of the transformed data can be found in Appendix [I].

#### IV. VARIABLE SELECTION

I initially performed analyses on each variable to compare its selection rate against the overall selection rate for the population (based on paygrade) over the entire 7 year period. The selection rates for the respective paygrades are:

PROMOTED TO	SELECTION RATE
MAJOR	65.55%
LT. COL.	52.80%
COLONEL	40.86%

I compared selection rates, chi-square values for each variable, and p-values (I wrote SAS routines specifying the chi-square analysis). Inclusion or exclusion of specific variables for the models are discussed below:

**SSN:** I included the SSN for identification purposes only. The software package S+ requires nonrecurring first entries (when the default option of sequential line numbering is over ridden) to specify entries, so the SSNs were used in that regard. Privacy act regulations prohibit displaying of SSNs when married up with specific personal and/or professional data.

**FISCAL YEAR:** The data base contains the records of all Marine Corps Officers of paygrade O3 (Captain), O4 (Major), and O5 (LtCol) in the primary promotion to the next higher paygrade in fiscal years 1986 through 1992, inclusive. Board precepts change from year to year, so individual board statistics were not analyzed as part of this study. The entire population based on paygrade was used to discover trends in variables affecting selection.

Many variables were analyzed by fiscal year (initially) to determine if there was annual fluctuation within variables. Some variables evidenced annual variation from the overall selection rate. Some variables were even subdivided further to determine if any difference existed within the variable itself. The following shows the variation of the selection rate to Major for officers assigned to operational (FMF) units when the board convened. The FMF variable is further broken down to which Marine Expeditionary Force (MEF) the officer is in. The Marine Corps has 3 MEFs. I MEF is headquartered in Camp Pendleton, CA, II MEF is at Camp LeJeune, NC, and III MEF is headquartered in Okinawa, Japan. Promotion rates varied by MEF (over the entire period). The rates by FY for each MEF are shown below:

FY	I MEF	II MEF	III MEF
86	62.86%	72.73%	68.42%
87	43.75%	41.67%	61.54%
88	72.73%	87.50%	85.71%
89	50.00%	72.00%	60.00%
90	50.00%	69.57%	70.00%
91	33.33%	40.00%	85.71%
92	50.00%	75.00%	66.67%

Overall selection rate to Major (O4) for each MEF was

I MEF 53%      II MEF 65%      III MEF 70%.

The number of officers in a particular MEF in the primary promotion zone in a given fiscal year ranged from a low of 7 (III MEF FY 88) to a high of 44 (II MEF FY 80). With a small number of officers in such a category, analysis of the rates is interesting, but does not prove to be statistically significant, especially when using a variable such as FMF to group the officers against officers assigned elsewhere. Also, as seen, the selection rates over time show a trend against officers assigned to I MEF, but when the MEFs are

combined, the FMF selection rate is within 2% points of the overall selection rate (for promotion to major).

**PAYGRADE:** The current paygrade of the officer in the primary promotion zone used to study the effects of a variable on selection.

**SELECTED:** The truth teller. Was an officer selected for promotion to the next higher pay grade? This variable is the one the entire study is based on.

**MARITAL STATUS:** A long held personal belief that single officers are discriminated against in the Marine Corps led the author to include this variable (I'm single!). The "SINGLE" variable includes those officers who are widowed, divorced, legally separated, and annulled, along with being plain old single.

**RACE/ETHNIC BACKGROUND:** The ethnic background of officers in the population is overwhelmingly Caucasian (WHITE). Black officers make up the next largest segment (just under 4%) with Hispanic, Native Americans, Asians and "Other" making up about 2% of the population. For this reason, the categories were reduced to two: WHITE and NONWHITE.

**SEX:** Two options. Women officers make up less than 4% of the population. Most of the analysis by fiscal year was inconclusive, therefore the whole period was used to get numbers large enough to do analysis.

**OCCUPATIONAL FIELD:** The Marine Corps lists over 40 individual primary MOSs that officers hold. Individual MOSs were analyzed just as were duty stations, with the same results. Annual variations based on the needs of the Marine Corps caused some MOSs to be selected at an above average rate one year, and below average other years. I combined the PMOSs into 5 categories, based on major type of specialty:

<b>CATEGORY</b>	<b>INCLUSIVE SPECIALTIES</b>
<b>COMBAT ARMS</b>	<b>INFANTRY, ARTILLERY, TANKS, TRACKED VEHICLES</b>
<b>FIXED WING PILOT</b>	<b>F-18, AV-8, A-6, C-130, C-9, A-4, F-4 ANY PILOT NOT FLYING HELICOPTERS</b>
<b>ROTARY WING PILOT</b>	<b>CH-46, CH-53, UH-1, AH-1 HELO PILOTS</b>
<b>NAVAL FLIGHT OFFICER (NFO/GIB)</b>	<b>NON PILOT COCKPIT CREW</b>
<b>SUPPORT</b>	<b>ANY OTHER MOS NOT SPECIFICALLY ASSIGNED ABOVE. ANY MARINE NOT DIRECTLY INVOLVED IN DIRECT COMBAT WITH THE ENEMY.</b>

**DUTY STATION:** The Marine Corps Codes Manual lists a separate Monitored Command Code (MCC) for each major command. The number of MCCs is prohibitively large for analysis of selection rate by MCC. That plus the small number of officers assigned to a particular MCC at the time of the board makes meaningful analysis impossible. Analysis of several type commands plus personal experience led to the following categories of Duty Stations:

**FLEET MARINE FORCE (FMF):** The officers assigned to operational combat or combat support units. As previously discussed, the FMF is composed of three separate expeditionary forces. The hierarchal description of the separate MEFs is covered extensively in numerous doctrinal publications and will not be discussed in this study.

**HEADQUARTERS MARINE CORPS (HQMC):** Those officers stationed or assigned to HQMC, at the Navy Annex in Arlington, VA.

**QUANTICO:** Those officers assigned to any of the separate commands aboard Marine Corps Base, Quantico, VA.

**RECRUITING DUTY:** Those officers assigned to the numerous recruiting offices, stations or districts.

**NON FMF:** Officers assigned to commands not specifically covered by the above categories. Includes Marine Corps Security Forces, overseas headquarters, Marine Corps Base support positions, and the Recruit Depots at Parris Island, SC, and San Diego, CA.

**EDUCATION LEVEL:** There are six different codes assigned to officer education level, from an undergraduate degree through post doctoral education. For ease of analysis, the cutoff was made at the advanced degree level, which includes a masters degree and education beyond that level. The two categories, advanced and undergraduate, describe the level of all the officers in the data base.

**SOURCE OF ENTRY:** There are about 20 different codes describing the commissioning source of a Marine Officer. I simplified the analysis by grouping the sources into the three most identifiable categories: USNA, ROTC, OCS. The OCS category includes all officers who did not graduate from the US Naval Academy, or did not complete the ROTC in college.

**GENERAL CLASSIFICATION TEST (GCT):** Upon commissioning, every officer (and all enlisted upon induction in boot camp) is administered the GCT test to measure basic math, reading, and reasoning skills. Analysis of various test scores showed a significant difference in selection rates at the 125 GCT level. The two categories, therefore, are HIGH ( $GCT \geq 125$ ) and LOW ( $GCT < 125$ ).

**MEDALS:** Personal awards are normally awarded in the Marine Corps for professional achievement (notwithstanding the classic "End of Tour Award") which merits special recognition. Analysis of the total number of medals awarded to an officer throughout his career, showed a significant effect on selection when 2 or more personal awards had been awarded to that officer. The precedence of the award (CMH vs Navy Achievement) was not considered. There was also no way to determine if an award was presented at the present paygrade. The two categories for medals were, then: TWO OR MORE, and LESS THAN TWO.

**APPROPRIATE LEVEL SCHOOL:** The Department of Defense manages (through the separate services) numerous professional military schools appropriate to each rank. Captains are selected and attend Amphibious

Warfare School, Advanced Infantry, Artillery, or Armor School (depending on MOS), etc. Majors likewise attend a school appropriate to their rank, as do Lt.Cols. The list of schools is lengthy and irrelevant. What is important, is that an officer attended a school appropriate to his rank. The two categories are YES or NO.

**COMBAT  
SERVICE:**

The Marine Corps being the nation's force in readiness, I was interested in whether participation in combat or expeditionary service enhanced selection opportunity. Service from Vietnam through the Persian (Saudi) Gulf are included in the data, but again, the categorical YES or NO indicates whether the officer had combat service.

The following tables show the variables used in the analysis with the appropriate statistics used in selection of a variable for the model:

**TO MAJOR (SELECTION RATE = 65.55%)**

<b>VARIABLE (DF)</b>	<b>SELECTION RATE</b>	<b>CHI- SQUARE</b>	<b>P - VALUE</b>
<b>RACE (1)</b>	WHITE: 66.05% NONWHITE: 58.84%	6.289	.012

## V. MODEL DEVELOPMENT

Categorical Data Analysis is a proper tool for use with much military data, especially modeling manpower trends. The purpose of such model fitting is to smooth the data in order to remove transient effects and enhance interpretation, and to develop understanding of the factors that contribute to variability.

A log linear model of the filtered factors including select vs. nonselect (response) was used to help in the modeling. The goal is to find factors correlated with the first factor (select/nonselect). Any factor not correlated to that factor was discarded. This was the initial screening for the model. Specifically, the CSS Statistica software package was used to conduct this initial screening. Factors entered as candidates were selected as previously discussed in this analysis. [Ref. 5] Main effects and significant interactions between those effects were studied and, where appropriate, included in the model(s).

The next step in the model building was to harness the S+ Software in order to perform the categorical step-wise modeling procedures. N-way tables were constructed and the ratio of select/nonselect counts were used as response. Residuals for this type of LOGIT analysis appeared to be normally distributed. Such modeling produces an estimate of the odds favoring selection for each cell. A cell is a specific set of cross classifications of the chosen factors.

As an example, consider the basic model

$$ODDS_{ijk} = e^{\mu + \alpha_i + \beta_j + \gamma_k + \theta_{ijk}}$$

where  $\mu$  is the intercept term,  $\alpha$ ,  $\beta$ ,  $\gamma$  are the main effects terms, and  $\theta$  represents the interaction between main effects.

It has main effects and interaction terms denoted by single and multiple subscripts respectively. Specific values for each model are discussed later in this analysis.

## VI. MODEL ANALYSIS

The variables used in developing each model were determined by selection of the variables with the lowest p-values for each paygrade. All models were developed using the Generalized Linear Model (GLM) function in the S+ language. "The generalized linear model requires two functions:

- \* a link function that describes how the mean depends on linear predictors,

$$g(\mu) = \beta^T x \quad , \text{ and}$$

- \* a variance function that captures how the variance of  $y$  depends upon the mean, with

$$\text{var}(y) = \phi V(\mu) \quad , \text{ with } \phi \text{ constant." [Ref. 4]}$$

For the binary response variable, the logit model defines the proportion

$$\mu = \frac{e^\eta}{1 + e^\eta}$$

$$\text{Where } \eta = \mu + \alpha_i + \beta_j + \gamma_k + \theta_{ijk}$$

and guarantees that the proportion is between (0,1).

The loglinear model that was developed for each model took the notational form  $\log \mu_{ijk} = \alpha + \beta^i + \beta^j + \beta^k$  where the superscript refers to the factor, and subscripts, if applicable, to the level of the factor.

The promotion models were developed using a log-linear stepwise regression in CSS Statistica software to determine main effects and interaction effects between variables on the response of selected or not selected for promotion. Once the models were developed, a maximum likelihood statistic was noted, a relevant p-value determined and the model then put into the S+ software to determine coefficients for each main effect and interaction effect. The modern parameterization technique is used by this software. That is, one level of each factor is used for reference and its coefficient is taken as zero. (an unmarried candidate for colonel has coefficient zero) A backwards stepwise regression (logistic regression) was executed for each paygrade using the variables up to and including all three way interactions (CSS Statistica showed no pertinent four way interactions), and the following models were generated:

**TO COLONEL: The variables selected to build this model are Marital Status, Duty Station, Appropriate Level School and Degree.**

VARIABLE	COEFFICIENT	t - VALUE
MU	-1.586	-5.024
MARRIED	0.458	1.818
ADV DEGREE	0.217	1.356
ALS ATTENDED	1.413	4.721
FMF DUTY	0.176	1.972
QUANTICO DUTY	-0.140	-0.741
HQMC DUTY	-0.126	-1.156
RECRUITING DUTY	0.134	0.888
ALS & ADV DEGREE	0.339	1.566
ALS & FMF DUTY	-0.117	-0.947
ALS & QUANTICO	-0.034	-0.137
ALS & HQMC	0.421	3.089
ALS & RECRUITING	0.096	0.429

The t statistics from this first model shows that the really significant effects are those with a t value beyond  $\pm 2$  (appropriate level school, the interaction between ALS and HQMC duty). Also, notice the effect marital status and possession of an advanced degree has on the selection rate.

**TO LIEUTENANT COLONEL: The variables selected for this model were Marital Status, Degree, Commission Source, Duty Station, and Appropriate Level School.**

<b>VARIABLE</b>	<b>COEFFICIENT</b>	<b>t - VALUE</b>
MU	-0.102	-0.381
MARRIED	0.000	0.002
ADV DEGREE	0.840	3.568
ALS ATTENDED	0.463	1.736
FMF DUTY	0.485	4.947
NON FMF DUTY	0.199	5.549
HQMC DUTY	0.132	3.445
RECRUITING DUTY	0.144	2.370
USNA GRADUATE	0.770	2.924
ROTC GRADUATE	0.068	0.384
MARRIED & USNA	-0.605	-2.223
MARRIED & ROTC	0.011	0.064
MARRIED & ALS	0.460	1.644
MARRIED & ADV DEG	-0.408	-1.652

Of note in this model are the effects, of duty station), advanced degree, and appropriate level school. The effect of a Naval Academy commission is also significant.

**TO MAJOR: The variables selected for this model are Marital Status, Degree, Commissioning Source, Medals, and Appropriate Level School.**

VARIABLE	COEFFICIENT	t - VALUE
MU	-0.073	-0.757
MARRIED	0.544	5.855
ALS ATTENDED	1.007	7.875
ADVANCED DEGREE	0.223	2.581
USNA GRADUATE	0.128	2.063
ROTC GRADUATE	-0.159	-4.494
MEDALS $\geq$ 2	1.045	6.592
USNA & MEDALS $\geq$ 2	-0.362	-1.959
ROTC & MEDALS $\geq$ 2	0.331	2.825

The variables in this model are all significant.

The models were all fit initially using the CSS Statistics software package. The

p - values associated with the fit of the models are:

TO COLONEL:	Max Likelihood Chi- Square	.8992
	Pearson Chi- Square	.9865
TO LT. COL:	Max Likelihood Chi- Square	.1979
	Pearson Chi- Square	.5765
TO MAJOR:	Max Likelihood Chi- Square	.9175
	Pearson Chi- Square	.9930

With the exception of the Max Likelihood Chi- Square value for the TO LT. COLONEL model, all models have very high p - values, indicating the relative fit of the model. Even lower readings could be used for not rejecting the null hypothesis

that the model provides a 'good' fit for predicting selection to Lt. Col. To facilitate selection, the number of variables was intentionally kept at five or fewer. More variables would have provided a better fit in each case, but overfitting the model was not the objective of this analysis.

Residual plots were prepared for each model. Minor transformation of the data was done to provide cell counts for each variable and factor within the variables. All residuals appeared to be normally distributed (random about 0). Of note, the horizontal axis was scaled from 0 to 1, and showed concentrations about the value one would expect for each pay grade. For example, the TO COLONEL data was randomly distributed above and below 0 on the vertical axis, but was centered roughly at a point to the left of the center on the horizontal axis, about 40% of the way along the horizontal, corresponding to the selection rate for that data. Similar observations were noted for the other two models.

The models for each paygrade are shown in Appendices [B,C,D]. Examples of how the models are used, i.e., how an officer's odds for selection are affected by inclusion or exclusion of certain variables are shown in Appendix [A].

## VII. CONCLUSIONS

The selection rates predicted by the model are not always the same as the selection rates of the specified population. Small population size and model smoothing (only using five main effects to describe the officer i.e., not overfitting the model) are two reasons for the disparity. The fitted odds, however, show a direct comparison to one officer's chances for promotion over another. What is important, though, is that the magnitude of the rates and their ordering is consistent throughout the population. The model consistently forecasts that officer A is more likely to be promoted than officer B, given inclusion or exclusion of variables. These forecasts reflect the same trends and magnitudes of the population. If the model forecasts a higher than average rate, it is validated by the data, if the model predicts an officer is significantly more likely to be selected than another officer, the data supports that also. Actual rates computed for a random number of officers shows anywhere from a 1% to a 14% difference between model and data, but the direction of rates by cell were consistent.

Comparison of all the models shows some variables are consistent throughout the career pattern of the officers in the population: Marital Status, attendance at an Appropriate Level School, and Advanced Degree. Differences exist also between paygrades which account for differences in what promotion boards look for. Personal awards are usually awarded to junior officers for meritorious performance, whereas,

more senior officers receive them as "end of tour awards," hence decreasing their importance. Duty station and commissioning source play a factor in the model, perhaps validating the service academy's claims as to the value of an academy education. Duty station choice or assignment also carries significant weight in the selection process. Assignment to "high pressure - high visibility" billets enhances one's opportunity for recognition and promotability; assignment to less glamorous duty usually indicates career termination, and again, such interpretations appear to be validated by the model.

This model can be used by career planners, monitors and manpower planners at the HQMC level to assist officers in developing and planning for their career opportunities. Likewise, the individual officer can use this model to determine potential assignments, career enhancement opportunities, or career decisions. With the RIFs and drawdowns mandated by congress, this model can be used as a decision aid for officers faced with the choice of awaiting the next promotion board and receiving advancement, choosing retirement, or any incentive offered by the Marine Corps for an early departure from the Corps.

As with any model, constant refinement is required. This model was designed using data from 1986 - 1992, before the mandated reductions. Current officer assignment policies and mandates from DOD may change what is considered important for the selection process. Specifically, Joint Assignments were not included in this study (lack of data), and no distinction was made between Masters Degrees (or above) from a formal Special Education Program (SEP) such as NPS and a

degree achieved on an officer's off duty time. Command time was not a factor in the analysis, nor was the proportion of time spent in one's PMOS vs the proportion of time spent in "B" billets.

**APPENDIX A**  
**MODEL APPLICATION**

The basic model with zero values for certain levels of main effects and other levels of interaction effects gives promotion odds equal to  $e^u$  (see Example 3).

Adding main effects and interaction terms gives the user the opportunity to predict the odds of promotion based on an officer's profile as described by the parameters of the model. Specific profiles and comparisons with selection rates for the profile populations are illustrated below:

**EXAMPLE 1:** Single, Captain USNA Graduate, 2 personal awards, AWS

$$e^{-.073 + 1.007 + 1.044 + .128}$$

graduate. The odds of promotion for this officer are 8.22, and we see the selection rate for this officer (from the model) is 89%. The actual promotion rate for officers fitting this particular profile is 100%. It appears that the author was only one of two officers in the entire population fitting this particular profile. Another case may come from another captain with the following profile:

**EXAMPLE 2:** Married, OCS graduate, without any appropriate level school:

$$e^{-.073 + .544}$$

This officer's odds of promotion are 1.60 with the attendant selection rate equal to 62%. The actual selection rate for officers fitting this description is 63%.

**EXAMPLE 3:** For a single captain with no appropriate level school, no awards, no advanced degree and an OCS product (our basic officer profile), the odds are even less:

$$e^{-.073}$$

which comes to .93 with an attendant selection rate of 48%. Comparing this rate with the actual selection rate of the population matching this profile (48%) shows a comparable forecast.

In each case presented above, we see the proximity of selection rates between the model and the officers actually in the specified profile. Similar comparisons for selection to Lt. Colonel and Colonel produce comparable results. Inclusion of further examples in this appendix would serve no useful purpose. The user of the model should be able to select the appropriate statistic(s) and perform the calculations required for prediction of selection rates and odds.

## APPENDIX B

### COEFFICIENTS FOR SELECTION TO MAJOR

The following table contains the coefficients, standard errors and t-statistic for promotion to major.
