**13. ABSTRACT (Maximum 200 words)**
This Performance Oriented Packaging (POP) test was conducted to ascertain whether the packing box for the Mk 117 Mod 0 JATO Rocket Motor (Drawing 1638AS122) meets the Packing Group II requirements specified by the Code of Federal Regulations, Title 49 CFR, Parts 106 through 178, dated 1 October 1992. The packaged commodity used for the test was two inert rocket motors weighing 23 kg (50 pounds) each. This represents the current maximum commodity weight. To compensate for future growth variations in commodity and/or packaging, 4 kg (10 pounds) were added. The box was initially qualified for a gross weight of 59 kg (130 pounds) using Test Report DODPOPHM/USA/DOD/NADTR92028. This report qualifies the box for a gross weight of 64 kg (140 pounds). The results indicate that the box has conformed to the POP requirements.

INTRODUCTION

This Performance Oriented Packaging (POP) test was performed to ascertain whether the packing box for the Mk 117 Mod 0 JATO Rocket Motor (Drawing 1638AS122) meets the Packing Group II requirements specified by the Code of Federal Regulations, Title 49 CFR, Parts 106 through 178, dated 1 October 1992. The packaged commodity used for the test was two inert rocket motors weighing 23 kg (50 pounds) each. This represents the current maximum commodity weight. To compensate for future growth variations in commodity and/or packaging, 4 kg (10 pounds) were added. The box was initially qualified for a gross weight of 59 kg (130 pounds) using Test Report DODPOPHM/USA/DOD/NADTR92028. This report qualifies the box for a gross weight of 64 kg (140 pounds).

Due to unavailability only two boxes were used for testing. This is less than the number required by the regulations. Approval for this deviation has been granted by the Under Secretary of Defense, Memorandum for the Joint Logistics Commanders dated 22 February 1990.

TESTS PERFORMED

1. **Base Level Vibration Test**

   This test was performed in accordance with Title 49 CFR 178.608. Box #1 was placed on a repetitive shock platform which has a vertical linear motion of 1-inch double amplitude. Movement of the box was restricted during vibration in all but the vertical direction. The frequency of the platform was increased until the box left the platform 1/16 of an inch at some instant during each cycle. Test time was 1 hour.

2. **Stacking Test**

   This test was performed in accordance with Title 49 CFR 178.606. Box #1 was subjected to a force applied to its top surface equivalent to the total weight of identical packages stacked to a minimum height of 3 meters (including the test box). A weight of 762 kg (1,680 pounds) was stacked on the test box. The test was performed for 24 hours. The weight was then removed and the box examined.

3. **Drop Test**

   This test was performed in accordance with Title 49 CFR 178.603. Five drops were performed from a height of 1.2 meters (4 feet), impacting the following surfaces:
   
   a. Flat bottom using box #1.
   
   b. Flat top using box #1.
c. Flat on long side using box #1.

d. Flat on short side using box #1.

e. One corner using box #2.

PASS/FAIL

1. Base Level Vibration Test

The criteria for passing the base level vibration test is outlined in Title 49 CFR 178.608(c): No test sample should show any deterioration which could adversely affect transportation safety or any distortion liable to reduce packaging strength.

2. Stacking Test

The criteria for passing the stacking test is outlined in Title 49 CFR 178.606(d): No test sample may show any deterioration which could adversely affect transportation safety or any distortion likely to reduce its strength, cause instability in stacks of packages, or cause damage to inner packagings likely to reduce safety in transportation.

3. Drop Test

The criteria for passing the drop test is outlined in Title 49 CFR 178.603(f): A package is considered to successfully pass the drop tests if for each sample tested, no rupture occurs which would permit spillage of loose explosive substances or articles from the outer packaging.

TEST RESULTS

1. Base Level Vibration Test

Satisfactory.

2. Stacking Test

Satisfactory.

3. Drop Test

Satisfactory.
DISCUSSION

1. Base Level Vibration Test

   The input vibration frequency was 3.6 Hz. Immediately after the vibration test was completed, the box was removed from the platform, turned on its side and inspected. No unfavorable distortion or deterioration was observed.

2. Stacking Test

   The box was inspected after the 24-hour period was over. No unfavorable distortion or deterioration was observed.

3. Drop Test

   After each drop, the box was inspected. The contents were completely retained by the box.
