This Performance Oriented Packaging (POP) test was conducted to ascertain whether the Mk 732 Mod 0 Shipping and Storage Container (Drawing 53711-6205246) meets the Packing Group II requirements specified by the Code of Federal Regulations, Title 49 CFR, Parts 106 through 178, dated 1 October 1992. The packaged commodity used for the test was a simulated weight of steel and sand weighing 6.1 kg (13.5 pounds). This represents the current maximum commodity weight. To compensate for future growth variations in commodity and/or packaging, 1.4 kg (3.0 pounds) were added. Gross weight of the loaded container was 17.0 kg (37.5 pounds). The test results indicate that the container has conformed to the POP requirements.
INTRODUCTION

This Performance Oriented Packaging (POP) test was performed to ascertain whether the Mk 732 Mod 0 Shipping and Storage Container (Drawing 53711-6205246) meets the Packing Group II requirements specified by the Code of Federal Regulations, Title 49 CFR, Parts 106 through 178, dated 1 October 1992. The packaged commodity used for the test was a simulated weight of steel and sand weighing 6.1 kg (13.5 pounds). This represents the current maximum commodity weight. To compensate for future growth variations in commodity and/or packaging, 1.4 kg (3.0 pounds) were added. Gross weight of the loaded container was 17 kg (37.5 pounds).

Due to a limited availability only five containers were used for testing. This is less than the number required by the regulations. The containers were identified as #1, #2, #3, #4, and #5.

TESTS PERFORMED

1. Base Level Vibration Test

This test was performed in accordance with Title 49 CFR 178.608. Containers #1, #2, and #3 were placed on a repetitive shock platform which has a vertical linear motion of 1-inch double amplitude. Movement of the containers were restricted during vibration in all but the vertical direction. The frequency of the platform was increased until the containers left the platform 1/16 of an inch at some instant during each cycle. Test time was 1 hour.

2. Stacking Test

This test was performed in accordance with Title 49 CFR 178.606. Containers #1, #2, and #3 were used for this test. Each container was subjected to a force applied to its top surface equivalent to the total weight of identical packages stacked to a minimum height of 3 meters (including the test container). A weight of 170 kg (375 pounds) was stacked on each test container. The test was performed for 24 hours. The weight was then removed and the containers examined.

3. Drop Test

This test was performed in accordance with Title 49 CFR 178.603. Six drops were performed from a height of 1.2 meters (4 feet) in the following orientations (three drops for each orientation):

a. Horizontally using container #1, #2, and #3.

b. Diagonally on the edge between the cover assembly and the top ring of the container using container #4 and #5. (Two drops were performed on container #5.)
PASS/FAIL

1. **Base Level Vibration Test**

   The criteria for passing the base level vibration test is outlined in Title 49 CFR 178.608(c): No test sample should show any deterioration which could adversely affect transportation safety or any distortion liable to reduce packaging strength.

2. **Stacking Test**

   The criteria for passing the stacking test is outlined in Title 49 CFR 178.606(d): No test sample may show any deterioration which could adversely affect transportation safety or any distortion likely to reduce its strength, cause instability in stacks of packages, or cause damage to inner packagings likely to reduce safety in transportation.

3. **Drop Test**

   The criteria for passing the drop test is outlined in Title 49 CFR 178.603(f): A package is considered to successfully pass the drop tests if for each sample tested, no rupture occurs which would permit spillage of loose explosive substances or articles from the outer packaging.

**TEST RESULTS**

1. **Base Level Vibration Test**

   Satisfactory.

2. **Stacking Test**

   Satisfactory.

3. **Drop Test**

   Satisfactory.

**DISCUSSION**

1. **Base Level Vibration Test**

   The input vibration frequency was 3.95 Hz. Immediately after the vibration test was completed, each container was removed from the platform, turned on its side and inspected. No unfavorable distortion or deterioration was observed.
2. **Stacking Test**

Each container was inspected after the 24-hour period was over. No unfavorable distortion or deterioration was observed.

3. **Drop Test**

After each drop, the container was inspected. The contents were completely retained by the container.
