MICROWAVE ANTENNA TECHNOLOGY: Calculation of Fields Radiated by Rotationally Symmetric Horn Antennas Using Moment Method

C.W. Chuang and T.H. Lee

The Ohio State University ElectroScience Laboratory
1320 Kinnear Road
Columbus, Ohio 43212

The radiation problems of microwave horn antennas which are circularly symmetric (bodies of revolution) can be analyzed by the method of moments. With this approach, the induced currents on the horn surface can be decomposed into longitudinal and azimuthal components. Each current component is expanded in series form with piece-wise sinusoidal basis functions and the amplitude of each current sample is solved. From the resulting surface currents, the radiation patterns of the horn are calculated. This report summarizes this method and compares the calculated patterns with measured patterns for several horn antennas, including conical horns, corrugated horns and dual mode horns.

I. INTRODUCTION

The problem of electromagnetic radiation and scattering from perfectly conducting bodies of revolution of arbitrary shape has been studied by Mautz and Harrington [1]. An integro-differential equation was obtained from the potential integrals plus boundary conditions at the body and was solved by the method of moments. The simplification derived from a rotationally symmetric body is that all physical quantities can be expanded in Fourier series in the azimuth coordinate and quantities of different harmonics can be treated independently. A slightly different formulation based on the reaction theorem was also used by Chuang [2] to solve the same type of radiation and scattering problem.

In this report, the same formulation given in [2] is employed to set up generalized network equations for perfectly conducting bodies of revolution for application to the radiation problem of conical-type horn antennas. These antennas include smooth-wall conical horns, corrugated horns and dual-mode horns. The corrugated horn pattern is simulated by the H-plane pattern of a conical horn with the same inner dimension as the corrugated horn and is assumed to be circularly symmetric. Several examples are shown and compared with measured patterns in order to validate this approach. Appendix A shows the detailed derivation of the elements associated with the impedance matrix. The Body of Revolution Code has been modified and implemented into the OSU Reflector Antenna Code. One can look at the BR: Command of the User's Manual of the Reflector Antenna Code for more detail.
II. REACTION FORMULATION

Consider a primary source of an electric current \( \mathbf{J}_1 \) illuminating a perfectly conducting horn type scatterer. The scatterer occupies a volume \( T \) enclosed by a surface \( S \) as shown in Figure 2.1(a). Currents are induced on the scatterer which in turn will radiate such that the total fields are

\[
\mathbf{E} = \mathbf{E}^i + \mathbf{E}^s ,
\]

\[
\mathbf{H} = \mathbf{H}^i + \mathbf{H}^s ,
\]  

(1)

where \( \mathbf{E}^i \), \( \mathbf{H}^i \) and \( \mathbf{E}^s \), \( \mathbf{H}^s \) are the primary and scattered fields, respectively.

Now let us assume that the horn walls have zero thickness and replace the scatterer with free space as shown in Figure 2.1(b). From the equivalence principle, one can use the equivalent surface current \( \mathbf{J}_s \) to find the total scattered field. The surface current \( \mathbf{J}_s \) on the surface \( S \) is given by

\[
\mathbf{J}_s = \mathbf{n} \times (\mathbf{H}_1 - \mathbf{H}_2) 
\]

(2)

while the magnetic surface current \( \mathbf{H}_s \) vanishes since the scatterer is a perfect conductor. In Equation (2), \( \mathbf{n} \) is the unit outward normal to the surface and \( \mathbf{H}_1 \) and \( \mathbf{H}_2 \) are the total scattered fields outside and inside the horn. Further let us introduce an arbitrary current \( \mathbf{J}_m \) into region
(a) original problem

(b) free space equivalence

\[ \hat{J}_s = \hat{n} \times (\hat{H}_1 - \hat{H}_2) \]

Figure 2.1. Geometry of horn scattering problem.
T originally occupied by the scatterer. Assume that \( \mathbf{J}_m \) will radiate fields \( \mathbf{E}^m, \mathbf{H}^m \) into free space. Then from the reciprocity theorem we arrive at the reaction equation

\[
\int_S \mathbf{E}^m \cdot \mathbf{J}_S \, ds = \int_T \mathbf{E}^s \cdot \mathbf{J}_m \, dv
\]

\[
= - \int_T \mathbf{E}^i \cdot \mathbf{J}_m \, dv
\]

\[
= - \int_{V_i} \mathbf{E}^m \cdot \mathbf{J}_i \, dv \tag{3}
\]

Note that the volume integral is performed over the region \( T \) as shown in Figure 2.1(a) although the thickness of the horn surface is assumed zero. The condition \( \mathbf{E} = \mathbf{E}^i + \mathbf{E}^s = 0 \) on the surface has been used in Equation (3). The last integral in Equation (3) is performed over the region \( V_i \) where the source \( \mathbf{J}_i \) is located.

Let the z-axis be the axis of revolution and \( t \) the distance measured along a profile line of the conducting body as shown in Figure 2.2. Because of the orthogonality of Fourier series, different harmonics in azimuth coordinate (\( \phi \)) can be considered separately. For each harmonic, the induced currents on the conducting body can be written as

\[
\mathbf{J}_S = t f(t) \begin{pmatrix} \cos m\phi \\ \sin m\phi \end{pmatrix} + \phi g(t) \begin{pmatrix} \sin m\phi \\ -\cos m\phi \end{pmatrix} \tag{4}
\]
Figure 2.2. Coordinate system for horn scattering calculation by moment method.

where \( m \) can be zero or any positive integer. For a conical type horn antenna, we choose a short electric current dipole oriented in the \( x \)-direction and located on the \( z \)-axis inside the horn as the primary source. Therefore only the upper sinusoidal function in (4) will be used with \( m=1 \).

Following standard procedures of moment methods, Equation (4) is then expanded in a finite series

\[
J_S = \sum_n t I_n^t \frac{Q_n(t)}{k\rho(t)} \cos m\phi + \phi I_n^p (t) \sin m\phi \quad (5)
\]
where \( \rho(t) \) is the distance from a point \( t \) on the surface to the axis of revolution as shown in Figure 2.2. \( Q_n(t) \) and \( P_n(t) \) are expansion functions defined as

\[
Q_n(t) = \frac{\sin k(t-t_{n-1})}{\sin k(t_n-t_{n-1})}, \quad \text{if} \quad t_{n-1} < t \leq t_n
\]

\[
= \frac{\sin k(t_{n+1}-t)}{\sin k(t_{n+1}-t_n)}, \quad \text{if} \quad t_n < t \leq t_{n+1}
\]

\[
= 0 \quad , \quad \text{otherwise},
\]

(6)

and

\[
P_n(t) = 1 , \quad \text{if} \quad t_n < t \leq t_{n+1}
\]

\[
= 0 , \quad \text{otherwise},
\]

(7)

where \( t_i \) are sampling points along the generating profile line of the body of revolution as shown in Figure 2.3(a).

If the test sources are chosen to be the same as the expansion currents, Equation (3) then reduces to a matrix equation,

\[
\begin{bmatrix}
[2^{tt}] & [2^{t\phi}]
\end{bmatrix}
\begin{bmatrix}
[I^t]
\end{bmatrix}
= \begin{bmatrix}
y^t
\end{bmatrix}
\]

\[
\begin{bmatrix}
[2^{\phi t}] & [2^{\phi\phi}]
\end{bmatrix}
\begin{bmatrix}
[I^\phi]
\end{bmatrix}
= \begin{bmatrix}
y^\phi
\end{bmatrix}.
\]

(8)
The elements of the various matrices are

\[
Z_{1n}^{tt} = -\int t\cos m_\phi \frac{Q_1(t)}{k\rho(t)} \cdot \bar{E}^{il} \, ds
\]

\[
Z_{1n}^{t\phi} = -\int \phi \sin m_\phi P_1(t) \cdot \bar{E}^{il} \, ds
\]

\[
Z_{1n}^{\phi t} = -\int t\cos m_\phi \frac{Q_1(t)}{k\rho(t)} \cdot \bar{E}^{il} \, ds
\]

\[
Z_{1n}^{\phi \phi} = -\int \phi \sin m_\phi P_1(t) \cdot \bar{E}^{il} \, ds
\]

\[
V_{1l}^{t} = \int t\cos m_\phi \frac{Q_1(t)}{k\rho(t)} \cdot \bar{E}^i \, ds
\]

\[
V_{1l}^{\phi} = \int \phi \sin m_\phi P_1(t) \cdot \bar{E}^i \, ds
\]  \hspace{1cm} (9)

with \( m=1 \).
(a) scattered field produced by horn wall currents

(b) field $E_l$ from single expansion current $I_l$

Figure 2.3. Expansion of the surface current $j_S$. 

8
Note that $E_{\phi}^j$ and $E_{\phi}^l$ are electric fields generated by electric current modes $I_1^t$ and $I_1^\phi$, respectively. From the reciprocity theorem it can be shown that the impedance matrix is symmetric.

A. The Impedance Matrix

In this section the impedance elements will be discussed in detail. From Equation (9) the impedance elements have the general form:

$$Z_{ln} = -\int J_n \cdot E^l \, ds$$

$$= j\omega \int J_n \cdot \left[ \bar{A}^l + \frac{1}{k^2} \nabla \cdot \bar{A}^l \right] \, ds$$

$$= j\omega \int \left[ J_n \cdot \bar{A}^l - \frac{1}{k^2} \left( \nabla \cdot J_n \right) \left( \nabla \cdot \bar{A}^l \right) \right] \, ds$$

$$= \frac{j\omega \mu_0}{4\pi} \int \int \left[ J_n \cdot J_1^l - \frac{1}{k^2} \left( \nabla \cdot J_n \right) \left( \nabla \cdot J_1^l \right) \right] \frac{e^{-jkR}}{R} \, ds' \, ds \quad (10)$$

The derivation of this equation is given in Appendix A (in detail). In view of the following formulas,

$$\nabla \cdot J = \frac{1}{\rho} \frac{\partial}{\partial t} \left( \rho J_t \right) + \frac{1}{\rho} \frac{\partial}{\partial \phi} (\rho J_\phi), \quad (11)$$
\[ \begin{align*}
\hat{t} \cdot \hat{t}' &= \sin \xi \sin \xi' \cos(\phi - \phi') + \cos \xi \cos \xi', \\
\hat{t} \cdot \hat{\phi}' &= \sin \xi \sin(\phi - \phi'), \\
\hat{\phi} \cdot \hat{t}' &= -\sin \xi' \sin(\phi - \phi'), \\
\hat{\phi} \cdot \hat{\phi}' &= \cos(\phi - \phi')
\end{align*} \] (12)

where \( \xi \) is the angle between \( \hat{t} \) and \( \hat{z} \), the various impedance elements become

\[
Z_{1n}^{tt} = \frac{j \omega_0}{4k^2} \left[ \int \left[ \sin \xi \sin \xi' (G_{m+1} + G_{m-1}) + 2 \cos \xi \cos \xi' G_m \right] Q_n(t)Q_1(t') dt \cdot dt' - \frac{2}{k^2} G_m Q_n'(t)Q_1'(t') dt \cdot dt', \right)
\]

\[
Z_{1n}^{t \phi} = \frac{j \omega_0}{4k^2} \left[ \int \left( k \rho \sin \xi (G_{m+1} - G_{m-1}) P_n(t)Q_1(t') - \frac{2m}{k} G_m P_n(t)Q_1'(t') \right) dt \cdot dt', \right)
\]

\[
Z_{1n}^{\phi t} = \frac{j \omega_0}{4k^2} \left[ \int \left( k \rho' \sin (G_{m+1} - G_{m-1}) P_n(t)Q_1(t') - \frac{2m}{k} G_m Q_n(t)P_1(t') \right) dt \cdot dt', \right)
\]

\[
Z_{1n}^{\phi \phi} = \frac{j \omega_0}{4k^2} \left[ \int \left( k \rho' (G_{m+1} + G_{m-1}) P_n(t)P_1(t') - 2m^2 G_m \right) dt \cdot dt', \right)
\]

\[
Z_{1n}^{\phi \phi} = 2 \frac{t \phi_{n1}}{n1} \] (13)
These equations are derived in detail in Appendix A.

The variables in Equations (13) are defined as follows:

\[ G_m = \int_0^n \cos m \phi \frac{e^{-jkR}}{R} \, d\phi, \]  

(14)

\[ R = \left[ (z-z')^2 + (\rho-\rho')^2 + 4\rho \rho' \sin^2 \frac{\phi}{2} \right]^{\frac{1}{2}}. \]  

(15)

The evaluation of \( G_m \) has been discussed in detail by Mautz and Harrington [1].

B. Excitation Column

The primary source \( \tilde{J}_1 \) is chosen to be an x-directed on-axis electric dipole with dipole strength \( P_x \). The excitation element \( V_l^t \) associated with one of the monopoles of the current \( \tilde{J}_1 \) is given by

\[ V_l^t = \int_S \tilde{J}_1 \cdot \tilde{E}^i \, ds', \]

in which \( \tilde{E}^i \) is the electric field radiated by the primary source \( \tilde{J}_1 \) and the integration is carried over a ring of surface current. From reciprocity, one can calculate \( V_l^t \) by

\[ V_l^t = \int_{\gamma} \tilde{J}_1 \cdot \tilde{E}^1 \, dv \]
where $\hat{E}_1$ is the electric field radiated by the current mode $\hat{t} \mathbf{J}_1^t$ and the integration is carried over the space at which the primary source is located. Since the primary source is an on-axis dipole, one can express $\hat{J}^i$ as

$$\hat{J}^i = \hat{x} \mathbf{p}_x \delta(x) \delta(y) \delta(z-z_0)$$

where $\delta(x) \delta(y) \delta(z-z_0)$ indicates the dipole is located at $(0,0,z_0)$. Thus, $V_1^t$ is calculated by the following equation

$$V_1^t = \hat{x} \mathbf{p}_x \cdot \hat{E}_1(0,0,z_0)$$

The geometry for the calculation of $\hat{E}_1(0,0,z_0)$ is shown in Figure 2.4. The monopole is located between $t=t_1$ and $t=t_2$ with $P$ being the field point. The current distribution on the monopole is given by

$$\hat{t} \mathbf{J}_1^t = \frac{1}{k \rho(t)} \frac{I_1 \sin \left[ k(t_2-t) \right] + I_2 \sin \left[ k(t-t_1) \right]}{\sin kd} \cos m\phi$$

since piece-wise sinusoidal functions have been used to expand the surface current. The electric field $\hat{E}_1(0,0,z_0)$ radiated by $\hat{t} \mathbf{J}_1^t$ can be found by the following equation

$$\hat{E}_1 = -j\omega_0 \mathbf{A}_1 - \mathbf{v} \Phi$$

where $\mathbf{A}_1$ is the magnetic vector potential and $\Phi$ is the scalar potential.
Figure 2.4. Geometry for the radiation of a monopole with end points $t_1$, $t_2$ and the field point 0 on the axis of revolution.
The vector potential \( \vec{A}_1 \) is given by

\[
\vec{A}_1 = \int_{S} \mathbf{J}_1 \frac{e^{-jkR}}{4\pi R} \, ds'
\]

\[
= \int_{0}^{2\pi} \int_{t_1}^{t_2} \mathbf{J}_1 \frac{1}{k \rho(t')} \frac{I_1 \sin \left[ k(t_2-t') \right] + I_2 \sin \left[ k(t'-t_1) \right]}{\sin kd} \cos m\phi \, dt' \, d\phi
\]

\[
e^{-jkR} \frac{e^{-jkR}}{4\pi R} \rho(t') \, dt' \, d\phi
\]

or

\[
\vec{A}_1 = \frac{1}{k} \int_{0}^{2\pi} \cos \phi \left( \int_{t_1}^{t_2} \frac{I_1 \sin k(t_2-t') + I_2 \sin k(t'-t_1)}{\sin kd} \frac{e^{-jkR}}{4\pi R} \, dt' \right) \, d\phi
\]

\[
= \frac{1}{k} \int_{0}^{2\pi} \cos \phi \vec{A}_1' \, d\phi
\]

From the rotational symmetry of the problem, one can calculate the electric field \( \vec{E}_1' \) associated with \( \vec{A}_1' \) and then integrate over \( \phi \) to find \( \vec{E}_1' \). The electric field \( \vec{E}_1' \) radiated by

\[
\vec{E}(t) = t \mathbf{I}(t) = t \frac{I_1 \sin k(t_2-t') + I_2 \sin k(t'-t_1)}{\sin kd}
\]
is similar to the radiation of a z-directed current element with the same current distribution. The cylindrical components of the field are given as [3]

\[
E_t = \frac{n}{4\pi j \sin kd} \left[ (I_1 - I_2 \cos kd) e^{-jkR_2} + (I_2 - I_1 \cos kd) e^{-jkR_1} \right]
\]

and

\[
E_n = \frac{n}{4\pi j \rho_n \sin kd} \left[ \left( I_1 e^{-jkR_1} - I_2 e^{-jkR_2} \right) j \sin kd \right.
\]

\[
+ \left. (I_1 \cos kd - I_2) e^{-jkR_1} \cos \theta_1 + (I_2 \cos kd - I_1) e^{-jkR_2} \cos \theta_2 \right]
\]

where \( n \) is the free space wave impedance and \( E_t \) is the component along the axis of the monopole and \( E_n \) is the component orthogonal to the axis. The electric field \( \hat{E}_1' \) is thus given by

\[
\hat{E}_1' = \hat{t} E_t + \hat{n} E_n \quad , \quad z_o > z_c
\]

or

\[
\hat{E}_1' = \hat{t} E_t + \hat{n'} E_n
\]

\[
= \hat{t} E_t - \hat{n} E_n \quad , \quad z_o < z_c
\]

as shown in Figure 2.5.
Figure 2.5. Geometry for the discussion of normal component $E_n$.  

16
From Figure 2.2,

\[ \hat{t} \times \hat{p} = (\rho \sin \xi + z \cos \xi) \times (-\rho \rho_1 + z(z_o - z_1)) \]

\[ = \left[ -(z_o - z_1) \sin \xi - \rho_1 \cos \xi \right] \hat{\phi} \]

\[ = \left[ (z_o - z_1) \sin \xi + \rho_1 \cos \xi \right] \hat{\phi}. \]

When \( z_o > z_c \), \( \hat{t} \times \hat{p} \) is in the \( -\phi \) direction so that \( (z_o - z_1) \sin \xi + \rho_1 \cos \xi \) > 0; when \( z_o < z_c \), \( \hat{t} \times \hat{p} \) is in the \( \phi \) direction so that \( (z_o - z_1) \sin \xi + \rho_1 \cos \xi \) < 0. Consequently, the electric field \( \hat{E}_1 \) can be written as

\[ \hat{E}_1' = \hat{t} E_t + \text{sgn}(z_o - z_1) \sin \xi + \rho_1 \cos \xi \ n \ E_n \]

or

\[ \hat{E}_1' = (\rho \ sin \xi + z \ cos \xi) E_t + \text{sgn}(z_o - z_1) \sin \xi + \rho_1 \cos \xi \cdot \]

\[ (-\rho \ cos \xi + z \ sin \xi) E_n \]

or
\[ E'_1 = \rho \left( \sin \xi E_t - \text{sgn}(z_0 - z_1) \sin \xi + \rho_1 \cos \xi \right) \cos \xi E_n \]

\[ + z \left( \cos \xi E_t + \text{sgn}(z_0 - z_1) \sin \xi + \rho_1 \cos \xi \right) \sin \xi E_n \]

\[ = \left( x \cos \phi + y \sin \phi \right) \left( \sin \xi E_t - \text{sgn}(z_0 - z_1) \sin \xi + \rho_1 \cos \xi \right) \cos \xi E_n \]

\[ + z \left( \cos \xi E_t + \text{sgn}(z_0 - z_1) \sin \xi + \rho_1 \cos \xi \right) \sin \xi E_n \]

Consequently,

\[ E'_1(0,0,z_0) = \frac{1}{k} \int_0^{2\pi} \cos m\phi E'_1(0,0,z) \, d\phi \]

or

\[ E_1(0,0,z_0) = \begin{cases} 0 & , \, m>1 \\
\frac{x}{k} \left( \sin \xi E_t + \text{sgn}(z_0 - z_1) \sin \xi + \rho_1 \cos \xi \right) \cos \xi E_n & , \, m=1 \\
\frac{2\pi}{k} \left( \cos \xi E_t + \text{sgn}(z_0 - z_1) \sin \xi + \rho_1 \cos \xi \right) \sin \xi E_n & , \, m=0 \end{cases} \]

Thus, the excitation element \( V_{11} \) is given by

\[ V_{11} = \rho \vec{p}_x \cdot \vec{E}_1(0,0,z_0) \]

\[ = \rho \frac{\pi}{k} \left( E_t \sin \xi - \text{sgn}(z_0 - z_1) \sin \xi + \rho_1 \cos \xi \right) E_n \cos \xi \], \, m=1

(17)
In Equation (17), $P_x$ is the dipole strength of the primary source, the function $\operatorname{sgn}(x)$ is defined as

$$\operatorname{sgn}(x) = \pm 1, \text{ if } x \lesssim 0,$$

and $(0, z_0)$ and $(\rho_1, z_1)$ are the coordinates of the point $P$ and $t_1$.

The excitation element $V_1^\phi$ associated with the current mode $\hat{\phi} J_1^\phi$ is obtained accordingly by the equation

$$V_1^\phi = \int_S \hat{\phi} J_1^\phi \cdot \hat{\mathbf{z}}^i \, ds$$

$$= -j\omega \int_S \left[ \hat{\phi} J_1^\phi \cdot \hat{\mathbf{A}}^i - \frac{1}{k^2} \left( \nabla \cdot \hat{\phi} J_1^\phi \right) \left( \nabla \cdot \hat{\mathbf{A}}^i \right) \right] ds$$  \hspace{1cm} (18)

The vector potential due to a perpendicular on-axis dipole is

$$\hat{\mathbf{A}}^i = \frac{\mu_0}{4\pi R} P_x \hat{\mathbf{z}}^i e^{-jkR}$$ \hspace{1cm} (19)

where $R$ is the distance from the on-axis dipole to the current $J_1^\phi$. The current $J_1^\phi$ is given by

$$\hat{\phi} J_1^\phi = \hat{\phi} \left[ i_1^\phi P_1(t) + i_{1+1}^\phi P_{1+1}(t) \right] \sin m\phi .$$

In view of the form of $J_1^\phi$, the excitation element associated with the current mode $P_1(t) \sin m\phi$ is discussed next.
From Equation (18), the excitation element associated with $\hat{\phi} P_1(t) \sin m\phi$ is given by

$$V_1^\phi = -j\omega \int_S \left( \hat{\phi} P_1(t) \sin m\phi \cdot \hat{\phi} + \frac{1}{k^2} \left[ \nabla \cdot (\hat{\phi} P_1(t) \sin m\phi) \right] (\nabla \hat{A}_i) \right) dS$$

where

$$\hat{\phi} \cdot \hat{A}_i = \phi \times \frac{\mu_0 e^{-jkR}}{4\pi R} = -\sin\phi \left[ \phi \times \frac{\mu_0 e^{-jkR}}{4\pi R} \right]$$

and

$$\nabla \cdot (\hat{\phi} P_1(t) \sin m\phi) = \frac{1}{\rho} \frac{\partial}{\partial \phi} (P_1(t) \sin m\phi) = \frac{m}{\rho} P_1(t) \cos m\phi$$

For the on-axis dipole, $x'=0$ and $x=\rho \cos \phi$ so that $\nabla \cdot \hat{A}_i$ becomes
\[ \mathbf{v} \cdot \hat{A}^i = \frac{\mu_0 \mathbf{p} \times \left(-\frac{j \mathbf{k}}{R} - \frac{1}{R^2}\right)}{4\pi} \frac{e^{-j\mathbf{k}R}}{R} \rho \cos \phi. \]

Substituting the above relations into \( V^\phi_1 \), the following equation is obtained:

\[
V^\phi_1 = -j \omega \int_{S} \left(-\mathbf{p} \cdot \mathbf{P}_1(t) \frac{\mu_0 e^{-j\mathbf{k}R}}{4\pi R} \sin \phi \sin m\phi \right.
\]

\[
- \frac{1}{k^2} \left[ \mathbf{m} \cdot \mathbf{P}_1(t) \cos m\phi \right] \left[ \mu_0 \frac{\mathbf{p} \times \left(-\frac{j \mathbf{k}}{R} - \frac{1}{R^2}\right)}{4\pi R} \frac{e^{-j\mathbf{k}R}}{R} \rho \cos \phi \right] dS
\]

\[
= \frac{j \omega \mu_0}{4\pi k^2} \mathbf{p} \int_{0}^{2\pi} \int_{0}^{2\pi} \mathbf{P}_1(t) \left\{ k^2 \sin \phi \sin m\phi - m \left( \frac{j \mathbf{k}}{R} + \frac{1}{R^2} \right) \cos m\phi \cos \phi \right\} e^{-j\mathbf{k}R} R \rho \mathrm{d}t \mathrm{d}\phi
\]

The integration over \( \phi \) results in

\[
\int_{0}^{2\pi} \sin \phi \sin m\phi \, d\phi = \begin{cases} 0, & m \neq 1 \\ \pi, & m = 1 \end{cases}
\]

and

\[
\int_{0}^{2\pi} \cos \phi \cos m\phi \, d\phi = \begin{cases} 0, & m \neq 1 \\ \pi, & m = 1 \end{cases}
\]

For the horn radiation problem, \( m = 1 \), and \( V^\phi_1 \) becomes

\[
V^\phi_1 = \frac{j \omega \mu_0}{4\pi k^2} \mathbf{p} \int_{0}^{2\pi} \mathbf{P}_1(t) \left( k^2 - \frac{j \mathbf{k}}{R} - \frac{1}{R^2} \right) e^{-j\mathbf{k}R} R \rho \, dt
\]

(20)
The complete $V_1^φ$ is then the sum of two such equations (Equation (20)) associated with the two current modes comprising the current $J_1^φ$.

C. Far Zone Fields

The vector potential in the far-field zone due to a current mode of Equation (5) is given by

$$
\hat{A}_n = \frac{\mu_0 e^{-jkr}}{4\pi r} \int \hat{j}_n e^{jkr'} \cdot r' \rho' dt' d\phi'
$$

$$
= \frac{\mu_0 e^{-jkr}}{4\pi r} \int \left[ t' \cos mφ \frac{I_n(t')}{k\rho'} + \phi' \sin mφ \frac{I_n P_n(t')}{k\rho'} \right]
$$

$$
e^{-j[k(\rho'\sin\theta\cos(\phi'-\phi)+z'\cos\theta)]} \rho' dt' d\phi'$$

(21)

In view of the relations (excluding the $r$ component)

$$
\hat{\phi}' = \phi \cos(\phi'-\phi) - \theta \sin(\phi'-\phi) \cos\theta
$$

(22)

$$
\hat{\tau}' = \phi \sin\xi' \sin(\phi'-\phi) + \theta [\sin\xi' \cos\theta \cos(\phi'-\phi) - \cos\xi' \sin\theta]
$$

(23)

Equation (21) then reduces to

$$
A_n^φ = \frac{\mu_0 e^{-jkr}}{2r} \sin mφ \int J_m^φ(kρ'sinθ)P_n(t')e^{jkz'\cos\theta} \rho' dt'
$$

22
\[ A_{n\theta} = \frac{-\mu_0 e^{-jkr}}{2r} I_n \cos \phi J_{m-1}^n \int \frac{m \cos \theta}{k \rho' \sin \theta} J_m(k \rho' \sin \theta) P_n(t') e^{j k z' \cos \theta} \rho' dt' \]

\[ A_{n\phi} = \frac{-\mu_0 e^{-jkr}}{2r} I_n \sin \xi' \sin \phi J_{m-1}^n \int \frac{m}{k \rho' \sin \theta} J_m(k \rho' \sin \theta) Q_n(t') e^{j k z' \cos \theta} dt' \]

\[ A_{n\theta} = \frac{\mu_0 e^{-jkr}}{2r} I_n \cos \phi J_{m-1}^n \left[ J_m'(k \rho' \sin \theta) \sin \xi' \cos \theta - j \cos \xi' \sin \theta J_m(k \rho' \sin \theta) Q_n(t') e^{j k z' \cos \theta} dt' \right] \tag{24} \]

where \( J_m \) is a Bessel function and \( J_m' \) is its derivative with respect to the argument.

For the radiated field of a conical horn antenna, one also needs to include the radiation due to the primary dipole source. In the far-field zone, the vector potential of the perpendicular on-axis dipole of strength \( P_x \) is

\[ \vec{A} = (\vec{\theta} \cos \phi \cos \theta - \vec{\phi} \sin \phi) \frac{\mu_0 P_x}{4 \pi r} e^{-jkr + jk z \cos \theta} \tag{25} \]

The total radiated field can then be obtained from (24) and (25) as

\[ \begin{align*}
E_{\theta} &= -j \omega \mu_0 A_{\theta, \text{total}} \\
E_{\phi} &= -j \omega \mu_0 A_{\phi, \text{total}}
\end{align*} \]
III. EXAMPLES

In this section, six horn antennas are used as examples to validate the moment method computer code. The calculated patterns are compared with the measured patterns.

A. Prime Focus Conical Horn

The geometry of this horn antenna is shown in Figure 3.1. The radiation patterns of this horn, calculated at 11 GHz, are shown in Figure 3.2. The measured patterns are given in Figure 3.3 for comparison.

B. Prime Focus Corrugated Horn

The geometry of this corrugated horn is given in Figure 3.4. The inner dimension of this horn is used as a conical horn and the H-plane pattern of this simulated conical horn is calculated at 11.0 GHz. The resulting pattern, which is given in Figure 3.5, is treated as the pattern of the corrugated horn and assumed circularly symmetric. The measured principal plane patterns are shown in Figure 3.6.

C. Prime Focus Dual-Mode Horn

The geometry of this horn is shown in Figure 3.7. The moment method calculated patterns are shown in Figure 3.8 with the measured patterns shown in Figure 3.9.
D. Conical Horn for Cassegrain Reflector

The geometry for this horn antenna is shown in Figure 3.10. The radiation patterns of this horn, calculated at 11.0 GHz, are shown in Figure 3.11. The measured patterns are given in Figure 3.12 for comparison.

E. Corrugated Horn for Cassegrain Reflector

The geometry of this corrugated horn is given in Figure 3.13. The inner dimension of this horn is used as a conical horn and the H-plane pattern of this simulated conical horn is calculated at 11.0 GHz. The resulting pattern, which is given in Figure 3.14, is treated as the pattern of the corrugated horn and assumed circularly symmetric. The measured principal plane patterns are shown in Figure 3.15.

F. Dual-Mode Horn for Cassegrain Reflector

The geometry of this horn is shown in Figure 3.16. The moment method calculated patterns are shown in Figure 3.17 with the measured patterns shown in Figure 3.18.

IV. SUMMARY

The method of moments is used in this report to calculate the radiation patterns of horn antennas which can be treated as bodies of revolution. The simplification derived from a rotationally symmetric body is that all physical quantities are expanded in Fourier series in the azimuth coordinate and quantities of different harmonics are treated independently [1]. The harmonics related to the horn antenna problem are those with m=1, i.e., cosϕ and sinϕ.

Several examples are shown and compared with the measured patterns. Very good agreement has been obtained between calculations and measurements. One of the advantages of using the moment method instead of the well-known aperture integration method for the horn antenna problem is that the backlobes of the radiation patterns can be calculated. Also the aperture integration is not accurate for very small aperture antennas with aperture diameters less than 1.2λ.
APPENDIX A

DERIVATION OF ELEMENT OF IMPEDANCE MATRIX

A. Derivation of Equation (10)

From Equation (9) the impedance elements have the general form:

\[ z_{ln} = -\int \tilde{J}_n \cdot \tilde{E}^l \, ds \]  \hspace{1cm} (A.1)

where \( \tilde{J}_n \) is the expansion mode of the surface current \( \tilde{J}_s \) and \( \tilde{E}^l \) is the radiated electric field generated by the electric current mode \( \tilde{J}_1 \). \( \tilde{E}^l \) can be calculated by the vector potential \( A^l \) as

\[ \tilde{E}^l = -j\omega A^l + \frac{\nabla \cdot A^l}{j\omega \varepsilon} \]

\[ = -j\omega \left( A^l + \frac{\nabla \cdot A^l}{k^2} \right) . \]

Thus, Equation (A.1) becomes

\[ z_{ln} = j\omega \int \tilde{J}_n \cdot \left[ A^l + \frac{1}{k^2} \nabla \cdot A^l \right] ds \]

\[ = j\omega \int \left[ \tilde{J}_n \cdot A^l + \frac{1}{k^2} \tilde{J}_n \cdot (\nabla \cdot A^l) \right] ds \]  \hspace{1cm} (A.2)
By using the vector identity \( \nabla \cdot (f \mathbf{g}) = \mathbf{g} \cdot \nabla f + f \nabla \cdot \mathbf{g} \), one can express \( \mathbf{j}_n \cdot (\nabla \mathbf{A}) \) as

\[
\mathbf{j}_n \cdot (\nabla \mathbf{A}) = \nabla \cdot \left( \mathbf{j}_n \mathbf{A} \right) = \nabla \cdot \mathbf{j}_n \mathbf{A} - \mathbf{A} \cdot \nabla \mathbf{j}_n.
\]

Thus, Equation (A.2) becomes

\[
Z_{ln} = j \omega \int \mathbf{j}_n \cdot \mathbf{A} \, ds + \frac{j \omega}{k^2} \int \nabla \cdot \left( \mathbf{j}_n \mathbf{A} \right) \, ds - \frac{j \omega}{k^2} \int (\nabla \cdot \mathbf{j}_n)(\nabla \cdot \mathbf{A}) \, ds.
\]

(A.3)

From the surface form of the Divergence Theorem, the second term in (A.3) reduces to the following contour integral:

\[
\frac{j \omega}{k^2} \int \nabla \cdot \left( \mathbf{j}_n \mathbf{A} \right) \, ds = \frac{j \omega}{k^2} \oint_c (\nabla \mathbf{j}_n \mathbf{A}) \cdot \mathbf{n} \, dl
\]

(A.4)

where \( \mathbf{n} \) is the outward normal of the integration contour \( C \) as shown in Figure A.1.

Because of the symmetry of the geometry, \( \mathbf{j}_n \) only has \( \hat{t} \) and \( \hat{\phi} \) components. For the \( \hat{\phi} \) component,

\[
\mathbf{j}_n \cdot \mathbf{n} = 0.
\]

For the \( \hat{t} \) component,

\[
\mathbf{j}_n = 0 \text{ at the open aperture since } \mathbf{j}_n \text{ is a piecewise sinusoidal function. Consequently,}
\]

46
\[
\frac{j \omega}{k^2} \int \nabla \cdot (\mathbf{j}_n \mathbf{v} \cdot \mathbf{A}^l) ds = 0.
\]
\[
(A.5)
\]

Thus, from Equation (A.3),

\[
Z_{1n} = j \omega \int \mathbf{j}_n \cdot \mathbf{A}^l \ ds - \frac{j \omega}{k^2} \int (\nabla \cdot \mathbf{j}_n) (\nabla \cdot \mathbf{A}^l) ds.
\]
\[
(A.6)
\]

The vector potential $\mathbf{A}^l$ is given by

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{figureA1}
\caption{Geometry for the surface form of the Divergence Theorem.}
\end{figure}
\[ A_l = \frac{\mu_0}{4\pi} \int \hat{J}_1 \frac{e^{-jkR}}{R} \, ds' \]  

(A.7)

where \( R \) is the distance from the current \( \hat{J}_1 \) to \( \hat{J}_n \) and the integration is carried over the location of \( \hat{J}_1 \). Substituting (A.7) into (A.6),

\[
Z_{ln} = \frac{j\omega \mu_0}{4\pi} \int \hat{J}_n \cdot \hat{J}_1 \frac{e^{-jkR}}{R} \, ds' \, ds - \frac{j\omega \mu_0}{4\pi k^2} \int (\nabla \cdot \hat{J}_n) \nabla \cdot \left( \hat{J}_1 \frac{e^{-jkR}}{R} \right) ds' \, ds
\]

\[
= \frac{j\omega \mu_0}{4\pi} \left\{ \int \hat{J}_n \cdot \hat{J}_1 \frac{e^{-jkR}}{R} \, ds' \, ds - \frac{1}{k^2} \int \nabla \cdot \hat{J}_n \int \nabla \cdot \left( \hat{J}_1 \frac{e^{-jkR}}{R} \right) ds' \, ds \right\}
\]

(A.8)

Consider

\[
\int \nabla \cdot \left( \hat{J}_1 \frac{e^{-jkR}}{R} \right) ds' = \int \left( \hat{J}_1 \cdot \nabla \left( \frac{e^{-jkR}}{R} \right) + \frac{e^{-jkR}}{R} \nabla \cdot \hat{J}_1 \right) ds'
\]

\[
= \int \hat{J}_1 \cdot \nabla \left( \frac{e^{-jkR}}{R} \right) ds'
\]

(A.9)

in which \( \nabla \cdot \hat{J}_1 = 0 \) since \( \hat{J}_1 \) is the current on \( S' \) while \( \nabla \) is operating on \( S \).

From

\[
\nabla \left( \frac{e^{-jkR}}{R} \right) = - \nabla' \left( \frac{e^{-jkR}}{R} \right)
\]

48
Equation (A.9) becomes,

\[
\int \mathbf{V} \cdot \left( \mathbf{j}_1 \frac{e^{-jkR}}{R} \right) ds' = - \int \mathbf{j}_1 \cdot \mathbf{V}' \left( \frac{e^{-jkR}}{R} \right) ds' \\
= - \int \left[ \mathbf{V} \cdot \left( \mathbf{j}_1 \frac{e^{-jkR}}{R} \right) - \frac{e^{-jkR}}{R} \mathbf{V}' \cdot \mathbf{j}_1 \right] ds'
\]

(A.10)

The first term of Equation (A.10) can be shown as zero by changing the surface integral into a contour integral and using the same argument as the ones which lead to (A.5). Thus,

\[
\int \mathbf{V} \cdot \left( \mathbf{j}_1 \frac{e^{-jkR}}{R} \right) ds' = \int \left( \mathbf{V}' \cdot \mathbf{j}_1 \right) \frac{e^{-jkR}}{R} ds' 
\]

(A.11)

and \( Z_{1n} \) becomes

\[
Z_{1n} = \frac{j \omega}{4\pi} \left\{ \int \frac{\mathbf{j} \cdot \mathbf{J}_1 e^{-jkR}}{R} ds' ds - \frac{1}{k^2} \int \mathbf{V} \cdot \mathbf{j}_n \int \left( \mathbf{V}' \cdot \mathbf{j}_1 \right) \frac{e^{-jkR}}{R} ds' ds \right\}.
\]

\[
= \frac{j \omega}{4\pi} \int [\mathbf{j} \cdot \mathbf{j}_1 - \frac{1}{k^2} (\mathbf{V} \cdot \mathbf{j}_n) (\mathbf{V}' \cdot \mathbf{j}_1) \frac{e^{-jkR}}{R} ds' ds
\]

(A.12)

as written in Equation (10).
B. Derivation of Impedance Elements $Z_{ln}^{tt}, Z_{ln}^{t\phi}, Z_{ln}^{\phi t}, Z_{ln}^{\phi\phi}$

From Equation (9),

$$Z_{ln}^{tt} = - \int \hat{t} J_{n}^{t} \cdot \hat{E}_{tl} \, ds$$

$$Z_{ln}^{t\phi} = - \int \hat{\phi} J_{n}^{\phi} \cdot \hat{E}_{tl} \, ds$$

$$Z_{ln}^{\phi t} = - \int \hat{t} J_{n}^{t} \cdot \hat{E}_{\phi l} \, ds$$

$$Z_{ln}^{\phi\phi} = - \int \hat{\phi} J_{n}^{\phi} \cdot \hat{E}_{\phi\phi} \, ds$$

(A.13)

in which,

$$J_{n}^{t} = \cos m\phi \frac{Q_{n}(t)}{k\rho(t)}$$

$$J_{n}^{\phi} = \sin m\phi P_{n}(t)$$

and $Q_{n}(t), P_{n}(t)$ are defined in Equations (6) and (7). By using Equation (A.12),
\[
Z_{1n}^{tt} = \frac{j\omega L_0}{4\pi} \int \int \left[ t \ J_n^t \ t' J_1^t - \frac{1}{k^2} \ (\nabla \cdot t J_n^t)(\nabla' \cdot t' J_1^t) \right] \frac{e^{-jkR}}{R} \ ds'ds
\]
\[
Z_{1n}^{t\phi} = \frac{j\omega L_0}{4\pi} \int \int \left[ \phi \ J_n^t \ \phi' J_1^t - \frac{1}{k^2} \ (\nabla \cdot \phi J_n^t)(\nabla' \cdot \phi' J_1^t) \right] \frac{e^{-jkR}}{R} \ ds'ds
\]
\[
Z_{1n}^{\phi t} = \frac{j\omega L_0}{4\pi} \int \int \left[ t \ J_n^\phi \ t' J_1^\phi - \frac{1}{k^2} \ (\nabla \cdot t J_n^\phi)(\nabla' \cdot t' J_1^\phi) \right] \frac{e^{-jkR}}{R} \ ds'ds
\]
\[
Z_{1n}^{\phi \phi} = \frac{j\omega L_0}{4\pi} \int \int \left[ \phi \ J_n^\phi \ \phi' J_1^\phi - \frac{1}{k^2} \ (\nabla \cdot \phi J_n^\phi)(\nabla' \cdot \phi' J_1^\phi) \right] \frac{e^{-jkR}}{R} \ ds'ds
\]

(A.14)

Note that \( \nabla \cdot J = \frac{1}{\rho} \frac{\partial}{\partial t} (\rho J^t) + \frac{1}{\rho} \frac{\partial}{\partial \phi} (\rho J^\phi) \). Thus,

\[
\nabla \cdot J^t_1 = \frac{1}{\rho(t)} \frac{\partial}{\partial t} (\rho(t) J^t_1) = \frac{1}{\rho(t)} \frac{\partial}{\partial t} \left( \frac{1}{k} \cos m\phi \ Q_n(t) \right)
\]

\[= \frac{1}{k\rho(t)} \cos m\phi \ Q'_n(t) \]  \hspace{1cm} (A.15)

\[
\nabla \cdot J^\phi_1 = \frac{1}{\rho(t)} \frac{\partial}{\partial \phi} (J^\phi) = \frac{1}{\rho(t)} \frac{\partial}{\partial \phi} \left( \sin m\phi \ P_1(t) \right)
\]

\[= \frac{m}{\phi(t)} \cos m\phi \ P'_1(t) \]  \hspace{1cm} (A.16)

Also,

\[
\dot{t} = x(t \cdot \dot{\rho})(\dot{\rho} \cdot x) + y(t \cdot \dot{\rho})(\dot{\rho} \cdot y) + z(t \cdot \dot{z})
\]

\[= \dot{x} \sin\xi \cos\phi + \dot{y} \sin\xi \sin\phi + \dot{z} \cos\xi\]

51
where $\xi$ is the angle between $\hat{t}$ and $\hat{z}$.

$$\hat{\phi} = -\hat{x} \sin \phi + \hat{y} \cos \phi.$$  

Similarly,

$$\hat{t'} = \hat{x} \sin \xi' \cos \phi' + \hat{y} \sin \xi' \sin \phi' + \hat{z} \cos \xi'$$

$$\hat{\phi} = -\hat{x} \sin \phi' + \hat{y} \cos \phi'.$$

Consequently,

$$\hat{t} \cdot \hat{t'} = \sin \xi \sin \xi' \cos (\phi-\phi') + \cos \xi \cos \xi'$$

$$\hat{t} \cdot \hat{\phi'} = \sin \xi \sin (\phi-\phi')$$

$$\hat{\phi} \cdot \hat{t'} = -\sin \xi' \sin (\phi-\phi')$$

$$\hat{\phi} \cdot \hat{\phi'} = \cos (\phi-\phi').$$  \hspace{1cm} (A.17)

The distance $R$ between $\hat{J}_1$ and $\hat{J}_n$ is given by
\[ R = \left[ (x-x')^2 + (y-y')^2 + (z-z')^2 \right]^{\frac{1}{2}} \]

\[ = \left[ (\rho \cos \phi - \rho' \cos \phi')^2 + (\rho \sin \phi - \rho' \sin \phi')^2 + (z-z')^2 \right]^{\frac{1}{2}} \]

\[ = \left[ \rho^2 \cos^2 \phi + \rho'^2 \cos^2 \phi' - 2 \rho \rho' \cos \phi \cos \phi' \right. \]
\[ + \left. \rho^2 \sin^2 \phi + \rho'^2 \sin^2 \phi' - 2 \rho \rho' \sin \phi \sin \phi' + (z-z')^2 \right]^{\frac{1}{2}} \]

\[ = \left[ \rho^2 + \rho'^2 - 2 \rho \rho' \cos (\phi - \phi') + (z-z')^2 \right]^{\frac{1}{2}} \]

\[ = \left[ (\rho^2 - 2 \rho \rho' + \rho'^2) + (z-z')^2 + 2 \rho \rho' (1 - \cos (\phi - \phi')) \right]^{\frac{1}{2}} \]

\[ = \left[ (\rho - \rho')^2 + (z-z')^2 + 4 \rho \rho' \sin^2 \left( \frac{\phi - \phi'}{2} \right) \right]^{\frac{1}{2}} \]  \hspace{1cm} (A.18)

where

\[ \rho = \rho(t), \quad \rho' = \rho'(t') \]
\begin{equation}
Z_{1n}^{tt} = \frac{j \omega_0}{4 \pi} \int \int \left[ \dot{t} J_n^t \dot{t}' J_n^t - \frac{1}{k^2} \left( \nabla \cdot t J_n^t \right) \left( \nabla \cdot t' J_n^t \right) \right] \frac{e^{-jkR}}{R} \, ds\, ds
\end{equation}

\begin{align*}
&= \frac{j \omega_0}{4 \pi} \int \int \left[ \cos \phi \cos \phi' \frac{Q_n(t)}{k \rho(t)} \cos \phi \cos \phi' \frac{Q_1(t')}{{k \rho}'(t')} \\
&\quad - \frac{1}{k^2} \left( \frac{1}{k \rho(t)} \cos \phi \cos \phi' Q_n(t) \right) \left( \frac{1}{{k \rho}'(t)} \cos \phi \cos \phi' Q_1(t') \right) \right] \frac{e^{-jkR}}{R} \, ds\, ds
\end{align*}

but \( ds' = \rho'(t') \, d\phi' \, dt' \)

\( ds = \rho(t) \, d\phi \, dt \),
thus,

\begin{equation}
Z_{1n}^{tt} = \frac{j \omega_0}{4 \pi} \int \int \int \int \left[ \sin \xi \sin \xi' \cos(\phi - \phi') + \cos \xi \cos \xi' \right] \cos \phi \cos \phi' \frac{Q_n(t)Q_1(t')}{{k^2}} \frac{e^{-jkR}}{R} \, d\phi' \, d\phi \, dt' \, dt
\end{equation}

(A.19)
For the horn radiation problem, $m \neq 0$. Consider

$$\int_{\phi}^{\phi'} \cos(\phi - \phi') \cos m\phi \cos m\phi' \frac{e^{-jkR}}{R} \ d\phi' \ d\phi$$

$$= \frac{1}{2} \int_{\phi'}^{\phi} \cos(\phi - \phi') [\cos m(\phi - \phi') + \cos m(\phi + \phi')] \frac{e^{-jkR}}{R} \ d\phi \ d\phi'$$

(A.20)

Let $\psi = \phi - \phi'$ and noting that $R$ is a function only of $\psi$, Equation (A.20) becomes

$$\frac{1}{2} \int_{0}^{2\pi} \int_{0}^{2\pi} \cos \psi [\cos m\psi + \cos m(\psi + 2\phi')] \frac{e^{-jkR}}{R} \ d\psi d\phi'$$

$$= \frac{1}{2} \int_{0}^{2\pi} \int_{0}^{2\pi} [\cos \psi \cos m\psi + \cos \psi \cos m(\psi + 2\phi')] \frac{e^{-jkR}}{R} \ d\phi' d\psi$$

$$= \frac{1}{2} \int_{0}^{2\pi} \left\{ \cos \psi \cos m\psi \frac{e^{-jkR}}{R} \int_{0}^{2\pi} d\phi' + \cos \psi \frac{e^{-jkR}}{R} \int_{0}^{2\pi} \cos m(\psi + 2\phi') d\phi' \right\} d\psi$$

$$= \frac{1}{2} \int_{0}^{2\pi} 2\pi \cos \psi \cos m\psi \frac{e^{-jkR}}{R} \ d\psi$$

55
\[= \pi \int_{\psi=0}^{2\pi} \cos \psi \cos \psi \frac{e^{-jkR}}{R} \, d\psi\]

\[= 2\pi \int_{\psi=0}^{\pi} \cos \psi \cos \psi \frac{e^{-jkR}}{R} \, d\psi\]

\[= \pi \int_{\psi=0}^{\pi} \left[ \cos(m+1)\psi + \cos(m-1)\psi \right] \frac{e^{-jkR}}{R} \, d\psi\]

Let \(G_m\) be

\[G_m = \int_{0}^{\pi} \cos \phi \frac{e^{-jkR}}{R} \, d\phi\]

thus,

\[\int_{\phi}^{\phi'} \int_{\phi}^{\phi'} \cos(\phi - \phi') \cos \phi \cos \phi' \frac{e^{-jkR}}{R} \, d\phi' \, d\phi = \pi \left( G_{m+1} + G_{m-1} \right) \quad (A.21)\]

Consider

\[\int_{\phi}^{\phi'} \int_{\phi}^{\phi'} \cos \phi \cos \phi' \frac{e^{-jkR}}{R} \, d\phi' \, d\phi = \frac{1}{2} \int_{\phi}^{\phi'} \int_{\phi}^{\phi'} \left[ \cos(\phi - \phi') + \cos(\phi + \phi') \right] \frac{e^{-jkR}}{R} \, d\phi \, d\phi' \quad (A.22)\]

By letting \(\psi = \phi - \phi'\), \((A.22)\) becomes
\[
\frac{1}{2} \int_{\phi' = 0}^{2\pi - \phi'} \left[ \cos \psi + \cos (\psi + 2\phi') \right] e^{-jkr} \frac{\psi}{R} \, d\psi \, d\phi'
\]

\[
= \pi \int_{0}^{2\pi} \cos \psi \frac{e^{-jkr}}{R} \, d\psi
\]

\[
= 2 \pi \cos \frac{e^{-jkr}}{R} \, d\psi
\]

\[
= 2 \pi G_m
\]

(A.23)

Substituting Equations (A.21) and (A.23) into (A.19) gives

\[
Z_{1n}^{tt} = \frac{j\omega}{4\pi} \int_{t}^{t'} \left\{ \pi \left( \sin \xi \sin \xi' (G_{m+1} + G_{m-1}) + 2 \cos \xi \cos \xi' \right) \frac{1}{k^2} Q_0(t) Q_1(t') \right. \\
- \frac{2\pi}{k^4} G_m Q'_n(t) Q'_1(t') \left. \right\} dt' dt
\]

\[
= \frac{j\omega}{4k^2} \int_{t}^{t'} \left\{ \left( \sin \xi \sin \xi' (G_{m+1} + G_{m-1}) + 2 \cos \xi \cos \xi' \right) Q_0(t) Q_1(t') \right. \\
- \frac{2}{k^2} G_m Q'_n(t) Q'_1(t') \left. \right\} dt' dt
\]

(A.24)
(2) \( Z_{1n}^{t\phi} \):

\[
Z_{1n}^{t\phi} = \frac{j\omega}{4\pi} \left[ \phi \left( \mathbf{t} \cdot \mathbf{t'} \right) J_1 - \frac{1}{k^2} \left( \mathbf{v} \cdot \mathbf{t} \right) \left( \mathbf{v'} \cdot \mathbf{t'} \right) J_1 \right] \frac{e^{-jkR}}{R} ds'ds
\]

\[
= \frac{j\omega}{4\pi} \int \int \left[ \left( \phi \cdot \mathbf{t}' \right) \sin m\phi P_n(t) \cos m\phi' Q_1(t') \right] \frac{Q_1(t')}{k\rho'(t')} ds'ds
\]

\[- \frac{1}{k^2} \left( \frac{m}{\rho(t)} \cos m\phi P_n(t) \left( \frac{1}{k\rho(t')} \cos m\phi' Q_1(t') \right) \right] \frac{e^{-jkR}}{R} ds'ds
\]

\[
= \frac{j\omega}{4\pi} \int \int \int \int \left[ -\sin\xi' \sin(\phi - \phi') \sin m\phi \cos m\phi' P_n(t) \frac{Q_1(t')}{k\rho'(t')} \right]
\]

\[- \frac{1}{k^2} \frac{1}{k} \frac{m}{\rho(t)\rho'(t')} \cos m\phi \cos m\phi' P_n(t)Q_1(t') \right] \cdot
\]

\[
\frac{e^{-jkR}}{R} \int \rho(t)\rho'(t')d\phi'd\phi dt'dt
\]

(A.25)

Consider \((m \neq 0)\)

\[
\int_{\phi'} \int_{\phi} \sin(\phi - \phi') \sin m\phi \cos m\phi' \frac{e^{-jkR}}{R} d\phi'd\phi
\]

\[
= \frac{1}{2} \int_{\phi'} \int_{\phi} \sin(\phi - \phi') \left[ \sin m(\phi + \phi') + \sin m(\phi - \phi') \right] \frac{e^{-jkR}}{R} d\phi d\phi'
\]

58
Since \( \psi = \phi - \phi' \), the above equation becomes

\[
\int_\phi \int_{\phi'} \sin(\phi - \phi') \sin m \phi \cos m \phi' \frac{e^{-jkR}}{R} d\phi' d\phi
\]

\[
= \frac{1}{2} \int_{\phi = 0}^{2\pi} \int_{\phi' = 0}^{2\pi - \phi'} \sin \psi \sin m(\psi + 2\phi') \frac{e^{-jkR}}{R} d\psi d\phi'
\]

\[
= \frac{1}{2} \times 2\pi \int_{\psi = 0}^{2\pi} \sin \psi \sin m \psi \frac{e^{-jkR}}{R} d\psi
\]

\[
= \frac{1}{2} \pi \int_{\psi = 0}^{2\pi} [-\cos(m+1)\psi + \cos(m-1)\psi] \frac{e^{-jkR}}{R} d\psi d\phi'
\]

\[
= -\pi \int_{0}^{\pi} [\cos(m+1)\psi - \cos(m-1)\psi] \frac{e^{-jkR}}{R} d\psi = -\pi [G_{m+1} - G_{m-1}]
\]

(A.26)

Substituting (A.26) and (A.23) into (A.25) gives
\[ Z_{1n}^{t\phi} = \frac{j \omega_0}{4\pi} \int_t^{t'} \int_t^{t'} \left[ n \frac{\rho(t)}{k} \sin \xi' \left( G_{m+1-m-1} \right) p_n(t)Q_1(t') \right. \\
- \frac{1}{k^2} \frac{2m}{k} G_{m} Q_n(t)Q_1(t') \left. \right] dt' dt \\
= \frac{j \omega_0}{4k^2} \int_t^{t'} \int_t^{t'} \left[ k \rho(t) \sin \xi' \left( G_{m+1-m-1} \right) p_n(t)Q_1(t') \right. \\
- \frac{2m}{k} G_{m} Q_n(t)Q_1(t') \left. \right] dt' dt \\
\] (A.27)

(3) \[ Z_{1n}^{\phi t}; \]

\[ Z_{1n}^{\phi t} = \frac{j \omega_0}{4\pi} \int_t^{t'} \int_t^{t'} \int_t^{t'} \left[ t J_n^t \phi' J_1^\phi - \frac{1}{k^2} (\nabla \cdot t J_n^t)(\nabla \cdot \phi') \right] e^{-jkR \over R} ds' ds \\
= \frac{j \omega_0}{4\pi} \int_t^{t'} \int_t^{t'} \int_t^{t'} \left[ \sin \xi \sin(\phi - \phi') \cos m \phi \frac{Q_n(t)}{k \rho(t)} \sin m \phi' P_1(t') \right. \\
- \frac{1}{k^2} \left( \frac{1}{k \rho(t)} \cos m \phi Q_n(t) \right) \\
\cdot \left( \frac{m}{\rho'(t')} \cos m \phi' P_1(t') \right) e^{-jkR \over R} \rho(t) \rho'(t') \phi' \phi dt' dt \\
\] (A.28)

It can be shown that
\[
\int_{\phi}^{\phi'} \sin(\phi - \phi') \cos m\phi \sin m\phi' \frac{e^{-jkR}}{R} \, d\phi' \, d\phi = \pi \left( G_{m+1} - G_{m-1} \right) \quad (A.29)
\]

Substituting (A.29), (A.23) into (A.28) gives

\[
Z_{\phi t}^{*} = \frac{j\omega_{o}}{4\pi} \int_{t}^{t'} \int_{t}^{t'} \left[ \frac{1}{k\rho(t)} \sin \xi \left( G_{m+1} - G_{m-1} \right) Q_{n}(t) P_{1}(t') \right] \rho(t) \rho'(t') \, dt' \, dt
\]

\[
= \frac{j\omega_{o}}{4k^{2}} \int_{t}^{t'} \int_{t}^{t'} \left[ k\rho'(t') \sin \xi \left( G_{m+1} - G_{m-1} \right) Q_{n}(t) P_{1}(t') \right] \rho(t) \rho'(t') \, dt' \, dt
\]

\[
= \frac{2m}{k} G_{m} Q_{n}(t) P_{1}(t') \, dt' \, dt \quad (A.30)
\]

(4) \( Z_{\phi \phi}^{*} \):

\[
Z_{\phi \phi}^{*} = \frac{j\omega_{o}}{4\pi} \int_{t}^{t'} \int_{t}^{t'} \left[ \hat{\phi} J_{n} \hat{\phi'} J_{1} - \frac{1}{k^{2}} \left( \nabla \cdot \hat{\phi} \right) \left( \nabla \cdot \hat{\phi'} \right) \left( \nabla \times \hat{\phi} \right) \left( \nabla \times \hat{\phi'} \right) \right] \frac{e^{-jkR}}{R} \, ds' \, ds
\]

\[
= \frac{j\omega_{o}}{4\pi} \int_{t}^{t'} \int_{t}^{t'} \int_{\phi}^{\phi'} \int_{\phi}^{\phi'} \left[ \cos(\phi - \phi') \sin m\phi P_{n}(t) \sin m\phi' P_{1}(t') \right]
\]

\[- \frac{1}{k^{2}} \left( \frac{m}{\rho(t)} \cos m\phi P_{n}(t) \left( \frac{m}{\rho'(t')} \cos m\phi' P_{1}(t') \right) \right] \]

\[
\cdot \frac{e^{-jkR}}{R} \rho(t) \rho'(t') \, d\phi' \, d\phi \, dt' \, dt \quad (A.31)
\]
Again, it can be shown that

\[
\int_\phi^\phi' \int_\phi' \cos(\phi-\phi') \sin m\phi \sin m\phi' \frac{e^{-jkR}}{R} d\phi' d\phi = \pi (G_{m+1} + G_{m-1}) \tag{A.32}
\]

Substituting (A.32), (A.23) into (A.31) gives

\[
Z_{1n}^{\phi\phi} = \frac{j\omega_0}{4\pi} \int_t^t' \left[ \rho(t) \rho'(t') \left(G_{m+1} + G_{m-1}\right) P_n(t) P_1(t') \right] \frac{e^{-jkR}}{R} dt' dt
\]

\[
- \frac{2m^2}{k^2} \pi G_m P_n(t) P_1(t') \left[ \frac{e^{-jkR}}{R} \right] dt' dt
\]

\[
= \frac{j\omega_0}{4k^2} \int_t^t' \left[ k^2 \rho(t) \rho'(t') \left(G_{m+1} + G_{m-1}\right) - 2m^2 G_m \right] P_n(t) P_1(t') dt' dt
\]

\[
(A.33)
\]
