Abstract presented at Third International Conference on Injury Prevention and Control, 18-22 Feb 1996, Melbourne, Australia

Approved for public release; distribution is unlimited

PURPOSE: Studies of U.S. Army soldiers have found higher rates of injury among smokers. We tested this relationship for individuals performing military parachuting, an activity associated with high-energy collisions and relatively high injury rates.

METHODS: Three groups of U.S. Army soldiers (N=1706) participated in one of three prospective studies. The first two groups were students participating in basic airborne training in either 1991 (n=449) or 1992 (n=848). Each student made five parachute jumps over five days. The third group was experienced soldiers from a combat ready airborne unit (n=409) each completing a single jump in 1993. All individuals were given questionnaires prior to their jumps. The outcome measure was medically attended injuries. Logistic regression was used to analyze injury type, use of cigarettes, use of smokeless tobacco, age, gender, and physical fitness test scores (maximum number of situps in two minutes, maximum number of pushups in two minutes, and a two-mile timed run).

RESULTS: The risk of an injury was lower among students than combat jumpers (6.8/1000 jumps vs. 130/1000 jumps). Injury risk was significantly higher among older and less (truncated after 200 words)

tobacco, parachute, airborne, smokeless tobacco, gender, physical fitness, chewing tobacco, injury, nicotine, carbon monoxide

### GENERAL INSTRUCTIONS FOR COMPLETING SF 298

The Report Documentation Page (RDP) is used in announcing and cataloging reports. It is important that this information be consistent with the rest of the report, particularly the cover and title page. Instructions for filling in each block of the form follow. It is important to stay within the lines to meet optical scanning requirements.

**Block 1. Agency Use Only (Leave blank).**

**Block 2. Report Date.** Full publication date including day, month, and year, if available (e.g. 1 Jan 88). Must cite at least the year.

**Block 3. Type of Report and Dates Covered.** State whether report is interim, final, etc. If applicable, enter inclusive report dates (e.g. 10 Jun 87 - 30 Jun 88).

**Block 4. Title and Subtitle.** A title is taken from the part of the report that provides the most meaningful and complete information. When a report is prepared in more than one volume, repeat the primary title, add volume number, and include subtitle for the specific volume. On classified documents enter the title classification in parentheses.

**Block 5. Funding Numbers.** To include contract and grant numbers; may include program element number(s), project number(s), task number(s), and work unit number(s). Use the following labels:

- **C** - Contract
- **G** - Grant
- **PE** - Program
- **PR** - Project
- **TA** - Task
- **WU** - Work Unit
- **Element Accession No.**

**Block 6. Author(s).** Name(s) of person(s) responsible for writing the report, performing the research, or credited with the content of the report. If editor or compiler, this should follow the name(s).

**Block 7. Performing Organization Name(s) and Address(es).** Self-explanatory.

**Block 8. Performing Organization Report Number.** Enter the unique alphanumeric report number(s) assigned by the organization performing the report.

**Block 9. Sponsoring/Monitoring Agency Name(s) and Address(es).** Self-explanatory.

**Block 10. Sponsoring/Monitoring Agency Report Number (If known)**

**Block 11. Supplementary Notes.** Enter information not included elsewhere such as: Prepared in cooperation with...; Trans. of...; To be published in.... When a report is revised, include a statement whether the new report supersedes or supplements the older report.

**Block 12a. Distribution/Availability Statement.** Denotes public availability or limitations. Cite any availability to the public. Enter additional limitations or special markings in all capitals (e.g. NOFORM, REL, ITAR).

- **DOD** - See DoDD 5230.24, “Distribution Statements on Technical Documents.”
- **DOE** - See authorities.
- **NTIS** - Leave blank.

**Block 12b. Distribution Code.**

- **DOD** - Leave blank.
- **DOE** - Enter DOE distribution categories from the Standard Distribution for Unclassified Scientific and Technical Reports.
- **NASA** - Leave blank.
- **NTIS** - Leave blank.

**Block 13. Abstract.** Include a brief (Maximum 200 words) factual summary of the most significant information contained in the report.

**Block 14. Subject Terms.** Keywords or phrases identifying major subjects in the report.

**Block 15. Number of Pages.** Enter the total number of pages.

**Block 16. Price Code.** Enter appropriate price code (NTIS only).

**Blocks 17.- 19. Security Classifications.** Self-explanatory. Enter U.S. Security Classification in accordance with U.S. Security Regulations (i.e., UNCLASSIFIED). If form contains classified information, stamp classification on the top and bottom of the page.

**Block 20. Limitation of Abstract.** This block must be completed to assign a limitation to the abstract. Enter either UL (unlimited) or SAR (same as report). An entry in this block is necessary if the abstract is to be limited. If blank, the abstract is assumed to be unlimited.
PUBLICATION AND TECHNICAL PRESENTATION CLEARANCE

Date: 3 March 1995

1. Report/Presentation Title:
Tobacco Use and Injury Risk Among Military Parachutists

2. Authors: Amoroso, PJ, Dettori, JR, Reynolds, KL, Schneider, GA, Lavin, PT, Ryan, JB and Jones, BH

TOBACCO USE AND INJURY RISK AMONG MILITARY PARACHUTISTS

PURPOSE: Studies of U.S. Army soldiers have found higher rates of injury among smokers. We tested this relationship for individuals performing military parachuting, an activity associated with high-energy collisions and relatively high injury rates.

METHODS: Three groups of U.S. Army soldiers (N=1706) participated in one of three prospective studies. The first two groups were students participating in basic airborne training in either 1991 (n=449) or 1992 (n=848). Each student made five parachute jumps over five days. The third group was experienced soldiers from a combat ready airborne unit (n=409) each completing a single jump in 1993. All individuals were given questionnaires prior to their jumps. The outcome measure was medically attended injuries. Logistic regression was used to analyze injury type, use of cigarettes, use of smokeless tobacco, age, gender, and physical fitness test scores (maximum number of situps in two minutes, maximum number of pushups in two minutes, and a two-mile timed run).

RESULTS: The risk of an injury was lower among students than combat jumpers (6.8/1000 jumps vs. 130/1000 jumps). Injury risk was significantly higher among older and less physically fit individuals (injury risk increased 4% for each additional year of age and decreased 2% for each additional situp). There was no significant smoking effect [OR 0.49 (95% CI 0.11-2.13)]. Smokeless tobacco users had a higher risk of injury overall, [OR 1.52 (95% CI 0.94-2.47)]; this association was inconsistent across the study populations.

CONCLUSION: The associations of physical fitness and age with injury risk is consistent with previous findings. The effect of smokeless tobacco on these populations is unclear and will require further study. In this population where injuries are caused by single-event, high-energy trauma, no significant smoking effect was demonstrated. This finding suggests the effect of smoking on injury may be more important for low impact, repetitive events.
