Ghanshyam L. Vaghjiani (ERC), “CO-Chemiluminescence in the CH + O Gas Phase Reaction”

17th International Symposium on Gas Kinetics
(Univ. of Essen, Germany, 24-29 August 2002) (Statement A)

1. This request has been reviewed by the Foreign Disclosure Office for: a.) appropriateness of distribution statement, b.) military/national critical technology, c.) export controls or distribution restrictions, d.) appropriateness for release to a foreign nation, and e.) technical sensitivity and/or economic sensitivity.
Comments:

Signature ____________________________ Date ____________________________

2. This request has been reviewed by the Public Affairs Office for: a.) appropriateness for public release and/or b) possible higher headquarters review.
Comments:

Signature ____________________________ Date ____________________________

3. This request has been reviewed by the STINFO for: a.) changes if approved as amended, b) appropriateness of references, if applicable; and c.) format and completion of meeting clearance form if required
Comments:

Signature ____________________________ Date ____________________________

4. This request has been reviewed by PR for: a.) technical accuracy, b.) appropriateness for audience, c.) appropriateness of distribution statement, d.) technical sensitivity and economic sensitivity, e.) military/national critical technology, and f.) data rights and patentability
Comments:

The methylidyne (CH) radical is known to be an important reaction intermediate during the oxidation of hydrocarbon fuels. Its reactivity with combustion species such as O₂, O-atoms, CO₂, N₂, N₂O, NO, NO₂, NH₃ and numerous other hydrogenous, carbonaceous and sulfurous species is well reviewed¹,² and compiled in the literature.³ However, the nature of product branching, energy disposal and its theoretical treatment has been examined in only a few of these reactions; (CH + NO) and (CH + N₂) reactions by far being the most studied systems. Particularly lacking in the literature is information on the production of electronically excited state species. The Air Force Research Laboratory is interested in the methylidyne and the methylene (CH₂) radical reactions with O₂ and O-atoms since they are thought to play an important role in the production of ultraviolet/visible chemiluminescence when rocket plumes interact with the earth’s ambient atmosphere.⁴

Production of CO vis-uv-chemiluminescence has been observed for the first time in the gas phase reaction of the methylidyne radicals with atomic oxygen. A trace amount of CHBr₃ vapor was photo-decomposed in a fast discharge-flow tube/pulsed-photolysis reactor using a 248-nm laser under multi-photon-dissociation conditions to produce the CH(X₂Π) radicals in an excess of O-atoms in diluent helium carrier gas at 2.0 torr and 298 K. The time resolved chemiluminescence traces due to characteristic CO(A-X), CO(a-X) and CO(d-a) vibronic emissions were recorded at several band positions. 144.8 nm was the shortest wavelength at which CO emission was recordable. The integrated intensities of the CO emissions showed a quadratic dependence on the photolysis fluence employed. The dependence of the CO chemiluminescence on [O-atom] was studied to obtain the rate coefficient(s) for the chemiluminescent reaction(s). The data is best interpreted by postulating that CH(v"≥0) reactions with O-atoms lead to the observed CO-emissions.

Approved for public release, distribution unlimited
