Project is looking at a variety of ways to assess health of armor over life of vehicle (including prior to installation).

Making vehicle more intelligent, increase survivability for vehicle and soldier, cost effective, more real time status, health of armor and vehicle.

Portray capability to scan all types of armor with some type of wave/sound/light – data shows cracks/no cracks.

**TARDEC groups involved:** Survivability, Intelligent Ground Vehicle Systems, Condition Based Maintenance

**Industry:** General Dynamics / BAE

**Academia:** Michigan State University, University of Michigan, Wayne State University, Oakland University (supporting background research ways to measure health of armor)

**Audience:** future customers, other government labs, contractors, not so much universities
Survivability role – develop sensors and technologies for various armor recipes.
- Prototype different sensor enhanced armor on demonstrators.
- Lead the armor NDE/NDT life cycle integration.

Signal 1 = driving signal of transducer

Signal 2 = resonant vibration of undamaged plate

Signal 3 = resonant vibration of plate cracked and with one small hole
There is a profound difference in the shape and amplitude of the echo signal between the damaged and undamaged plates. Tests are underway using embedded transducers for real-time armor integrity monitoring.
GROUND VEHICLE POWER & MOBILITY
- Hybrid Electric
- Pulse Power
- Engines
- Fuel Cells
- Suspension
- Tracks

INTEGRATED SURVIVABILITY
- Active Defense
- Signature Management
- Laser Vision Protection
- Ballistic Protection

INTELLIGENT GROUND SYSTEMS
- Robotic Systems Technology
- Human-Robot Interaction
- Crew Interface and Automation
- Robotic Follower ATD
- ARV Robotic Technologies Program

SMART ARMOR
- Battery Pack w/ Integrated Heat Exchanger

CONDITION BASED MAINTENANCE
- Diagnostics/Prognostics
- Data Analytics
- Sensor Integration
- Network Architectures
- Predictive Maintenance

TECHNOLOGY DRIVEN. WARFIGHTER FOCUSED.
• Micro-Electro-Mechanical-Systems

• MEMS integrate silicon-based microelectronics with micromachining technology to produce a system of miniature dimension
Technological Advances of MEMS

• **Miniaturization**
  - Low Power Consumption
  - Low Mass
  - Low size
  - Ease of deployment and maintenance
  - Portability

• **Batch Fabrication**
  - Low cost of manufacturing
  - Bulk production

• **Precision and accuracy**

• **Integration**

Using microsensors and microactuators, MEMS augment the computational ability of microelectronics with:

- System and Material Health Assessment
- Control abilities

- Allows development of smart products
- Makes realization of complete Systems-on-a-Chip possible
Situational Awareness

Multi Functional Armor Sensors

Military Applications of MEMS

• Signal processing
• Wireless Communication
• Mass data storage
• Sensors for maintenance and structural monitoring
• Unattended sensors for tracking and surveillance
• Biomedical sensors
• Inertial measurements
• Aerodynamic and hydrodynamic systems
• Optical Fiber components and networks

Detection technologies

- **Accelerometers**
  - 2.6 mm x 1 mm proof mass, 1.4 μm air gap
  - 11 pF/g per electrode.
  - Noise floor: 0.18 g/√Hz at atmosphere.

- **Gyrosopes**
  - 200 V/deg/s in a dynamic range of +/-250 deg/s
  - Noise floor: 0.01 /s/√Hz at atmosphere.

MEMS based IMUs are displacing other technologies

• MEMS gyros are making great strides in displacing ring laser gyroscopes (RLG) and fiber optic gyroscopes (FOG).

• Conventional systems typically $7-8,000 each. The new MEMS systems will be considerably lighter and should cost $1,200 to $1,500 each.

• 10 of the top 12 IMU suppliers are either currently offering or actively developing MEMS gyro-based IMUs.

• Of the 60 IMUs available, or known to be in development, nearly 50% use (or will use) both MEMS gyros and MEMS accelerometers.

• Total market for MEMS gyros to grow from $279 million in 2002, to $396 million in 2007 (annual growth rate of 24.2%)
Analog Devices: MEMS Gyro

• **MEMS Magnetometers** can detect presence of equipment up to 100 feet below ground.
• Magnetometers can be scattered by air drop or individually positioned to provide tactical information.
• These Magnetometers sense changes in earth's magnetic field to detect metallic objects anytime they move.

Designing and Modeling Using MEMS Simulation Software
• We will demonstrate how to create and simulate a MEMS device using a simulation software.
  * An FBAR (film bulk acoustic resonator) MEMS device will be created in this presentation.
Overview

• Steps:
  • I) Materials
  • II) Fabrication Process
  • III) Creating a 2D Layout
  • IV) The 3D Model
  • V) Meshing
  • VI) Simulations
  • VII) Conclusion
• Step 1: Check for correct materials and material values.
Materials (cont.)

- (LEFT) values for the material ZnO which include stress, density, dielectric and more.

- (RIGHT) Some values for various materials that may be used.

Fabrication Process

- Step 2: Create the process we want to follow in the “Process Editor”.
  * Your process may require you to stack, straight cut, partition, etc. the MEMS device you are creating.
This is the fabrication process we intend to use for our FBAR device. There are 12 steps which include straight cutting and stacking of the various materials.
Create the 2D Layout

• **Step 3: Create a 2D layout of our FBAR device.**
  * This 2D layout will later be used to create the 3D layout which is needed for simulation.
• You can see 5 different layers in this layout.
• You can draw rectangles, circles, triangles, and many other shapes in this layout editor.
• **Step 4: Generate the 3D model.**
  
  * The MEMS simulation software automatically creates the 3D model using all of the information you have provided it with.
Our data has been used to create the above 3D model.
Meshing

• Step 5: The device we have created thus far is too large an object to be analyzed. Thus we must ‘mesh’ the device. This means to separate it into many small pieces.
• After meshing, the FBAR has been separated into many small rectangles which together form a single device.
Step 6: Begin various simulations on device.

* It is possible to simulate many physical phenomena using this MEMS simulation packages such as pressure, conductivity, motion, DC analysis, and more.
Simulation (cont.)

• For our FBAR, we apply a 1V charge to the top and notice various aspects of change that occur.
• We notice the stress on the device around the edges. (The red area indicates greater stress)
• We see the displacement that has taken place due to the input voltage. (The red area indicates greater displacement)
Here we see the resonance the 1V input causes our FBAR.
• The following slide shows a beam vibrating due to pressure application at its top.
Beam Vibrations
Summary

• MEMS based devices currently in use for
  – Inertial measurement units, IR imagers, explosive detection.
  – NDE real time sensors

• Many future possibilities, including the following
  – Biochemical sensors for gas and explosives detection
  – Neural implants for robotic insects
  – Smart skins
  – Biosensors for Soldiers
  – Many others
Emerging Technologies [one list...]

- **Technotronics**—from microelectronics to nanotronics, quantum-spintronics and biotronics
- **MEMs**
- **Nano Tech**—nanomachines, self assembly, nanotubes
- **Mobile telecommunications networks**
- **Sensors and Sensing systems**—smart sensors, distributed sensing, RFID, sensor nets and swarms, biosensors
- **Info tech**—virtual reality, ubiquitous computing, grid computing
- **Robotics**—intelligent systems, robot teams, nanobots, human augmentation
- **Autonomous Systems**—unmanned combat air vehicles, organic air vehicles, micro air vehicles, UGS, UUVs/USVs
- **Biotech**—genetic engineering, bio-diagnostics, bio-remediation, bio-weapons
- **Energy & Propulsion**—fuel cells, directed energy, superconductors
A technology has emerged called spintronics (spin transport electronics or spin-based electronics), where it is not the electron charge but the *electron spin* that carries information.

The discovery in 1988 of the giant magnetoresistive effect (GMR) is considered the beginning of the new, spin-based electronics. *GMR is observed in artificial thin-film* materials composed of alternate ferromagnetic and nonmagnetic layers.

A new generation of devices combining standard microelectronics with spin-dependent effects that arise from the interaction between spin of the carrier and the magnetic properties of the material is being developed.

Geometry of (a) nano-pillar and (b) nano-contact magnetic nanostructures used to study the spin-transfer torque effect.

The structures consist of two magnetic layers (thin “free” layer and thicker “fixed” layer shown in blue) and a non-magnetic spacer between them (shown in yellow). The spacer can be made of a non-magnetic metal (usually Cu) (spin-valve), or of a non-magnetic insulator (usually MgO) (magnetic tunnel junction).
