A presentation from the 2009 Topical Symposium:

Energy Security: A Global Challenge

Hosted by:
The Institute for National Strategic Studies of The National Defense University

29-30 September 2009

By
ADAM SIEMINSKI

Papers presented at NDU Symposia reflect original research by members of NDU as well as other scholars and specialists in national security affairs from this country and abroad. The opinions, conclusions, and recommendations expressed or implied within are those of the authors and do not necessarily reflect the views of the Department of Defense or any other agency of the Federal Government.
### Panel on emerging petroleum and natural gas issues

**Report Date:** 30 SEP 2009  
**Report Type:**  
**Dates Covered:** 00-00-2009 to 00-00-2009  

**Title and Subtitle:** Panel on emerging petroleum and natural gas issues  

**Performing Organization:** Deutsche Bank, Theodor-Heuss-Allee 70, 60486 Frankfurt, Germany

**Sponsoring/Monitoring Agency:**  

**DISTRIBUTION/AVAILABILITY STATEMENT:** Approved for public release; distribution unlimited

**Supplementary Notes:**  

**Security Classification:**  
a. REPORT — unclassified  
b. ABSTRACT — unclassified  
c. THIS PAGE — unclassified  

**Limitation of Abstract:** Same as Report (SAR)  

**Number of Pages:** 28

Energy Security: A Global Challenge
Institute for National Strategic Studies / NDU
Panel on emerging petroleum and natural gas issues
Washington / Fort McNair 30-Sep-2009

Adam Sieminski
Chief Energy Economist
Deutsche Bank
adam.sieminski@db.com
+ 1 202 662 1624

All prices are those current at the end of the previous trading session unless otherwise indicated. Prices are sourced from local exchanges via Reuters, Bloomberg and other vendors. Data is sourced from Deutsche Bank and subject companies.
DISCLOSURES AND ANALYST CERTIFICATIONS ARE LOCATED IN APPENDIX 1.
Energy Security: What’s it all about?

- **Vulnerability**
  - Rise in import quantity and balance of payments / currency issues
  - Disruptions / market failures
  - Political turmoil (MidEast, Africa, Lat.Am)
  - Price spikes / market pressures
  - Homeland infrastructure

- **Traditional responses to energy security** *(risk management)*
  - Demand restraint (security of demand?)
  - Supply diversity
  - Surge production (location?)
  - Strategic stocks (when to use?)
  - International co-operation / IEA
  - Flexible markets (futures; technology)

---

**Churchill’s Law**
Safety and certainty in oil lie in variety and variety alone.

**Thatcher’s Law**
The unexpected happens. You had better prepare for it.

**Palmerston’s Law**
We have no eternal allies and no perpetual enemies. Our interests are perpetual and eternal.

Source: Deutsche Bank
Do Speculators Threaten Energy Security?

Politicians are looking for somebody to blame

Why Don’t They Look Here?

- Constrained oil supply from key producers like Russia, Venezuela, Nigeria, Iran, Iraq and others.
- Lack of OPEC spare production capacity and untimely cutbacks by OPEC at the end of 2006 that were not reversed until late 2007.
- Subsidies on oil consumption in many rapidly growing (economy, population or both) countries in Asia and the Middle East.
- US dollar depreciation.
- Lack of spare refining capacity to handle heavy sour crude oil.

Source: Deutsche Bank
What Does the Past Tell Us About the Future?

Is the energy tank full or running on empty?

If the emerging market economies recover, world GDP could be boosted.
What a Global Recession Means for Oil Demand

World oil demand grows at about 1.5-2.0% less than global GDP.

If global GDP is 3% in 2009, oil demand would be expected to rise by only 1%, or about 850 kb/d.

Answer: Collapse

Source: IEA, DB Global Markets Research

Month IEA forecast was made

Source: IEA, DB Global Markets Research
The lack of spare OPEC production capacity played a strong role in the run-up in oil prices in 2003-08.

In 2009 and 2010, high spare capacity should help moderate prices.

As OPEC cuts quotas, spare capacity increases

Source: IEA, DB Global Markets Research
Refinery Capacity Additions Are Robust

Distillation capacity rising faster than demand in 2009 and 2010

The lack of spare refining capacity played a strong role in the run-up in oil prices in 2007-08.

This is reversing in 2009-10.
Another (usual) sign of near-term weakness in the oil markets.

OECD Inventories Very High... but Peaked?

Days forward cover of OECD crude and product stocks

Source: IEA, DB Global Markets Research
Price to Inventory Relationship Returning?

Days forward cover of OECD crude and product stocks vs. oil prices

Suggests that OPEC’s ability to manage prices via inventories may be improving.
According to the IMF, in the long run, a 1% depreciation in the US dollar is associated with increases for gold and oil prices of more than 1%.

In the short run, the elasticity is close to 1, but higher for gold than for crude oil, says the IMF.

We believe the relationship between oil prices and the US dollar is highly unstable. However, the EURUSD at 1.50 implies triple-digit oil.

Source: Nymex, Bloomberg, DB Global Markets Research
Looking ahead to late 2010, we wonder if there could be a setback.

Household buying power may still be constrained.

Capital spending may be crimped by excess capacity.

Residential investment may be hamstrung by more foreclosures.

Spending on commercial structures has only recently turned downward.

The relationship between the S&P 500 and oil is usually inverse.

From July 2008 to the start of March 2009, the two moved in parallel.

From July 2009, the relationship is back to the more traditional inverse correlation.
The Shape of the Economic Recovery Matters

Source: CSIS, IMF, Deutsche Bank
A theme that does not go away easily

Outlook

- One third of the world’s population is just entering the middle class and want the oil-consuming lifestyle that goes with that.

Some analysts think that global oil production will peak within the next few years.

Peak Oil and Peak Gas

Source: Association for the Study of Peak Oil

Copyright: The Economist
Used with Permission
Dr. M. King Hubbert, a geologist for Shell and the USGS in the early 1960s, used a bell curve to correctly predict the 1972 peak in US oil production. A number of followers have attempted to extend Hubbert’s methodology to forecast a world oil peak this decade. Hubbert models do not account for changes in technology, costs, prices, or politics - all of which can have a huge impact on the actual shape of the production curve. Hubbert peak oil models assume a symmetric curve to determine the year and amount of peak production. Increases in subsoil knowledge, the spread of technological progress, and the advancement of drilling – along with political decisions and oil price changes – have shown time and again that peak production can be increased and delayed, so the decline phase of the bell curve can be shifted to the right.

“Peak Oil” Theory
(1) requires a “final” estimate of the level of ultimately recoverable reserves (URR)… but URR estimates have been rising.
(2) assumes that once half of the world’s reserves have been used up, production must fall… but that point keeps moving ahead in time.

“…doomsayers hard at work fanning the flames of hopelessness and pessimism”
Leonardo Maugeri

Outlook

Source: DB Global Markets Research
Many experienced international oil companies say that instability is more of a problem than “dangerous places”.

Most of the growth in oil production is NOT coming from vacation spots.

Trouble with Russia’s Economy  March  2008

Russian production declines for the first time in a decade in 2008

Putin’s policies in his first term worked but in his second term were a disaster for oil output.

The Russian government’s policy of hostility to its own oil entrepreneurs, growing disdain for foreign capital, and desire to maximize taxes regardless of the impact on capital investment brought an end to the growth in production that characterized President’s Putin’s first term (2000-2004).

Although “peak oil” proponents are citing the development as proof that global production is faltering because of geological constraints, we see the situation as offering strong evidence that oil production problems are being driven more by “above the ground” problems.

Achieving the IEA’s 450ppm Scenario

To hold CO2 in the atmosphere to 450ppm requires a 25gt/yr emission limit

Outlook
- Efficiency gains and deployment of existing low-carbon energy account for most of the savings
- OECD and Non-OECD countries must both work towards reducing CO2 emissions
- The scale of effort required is substantial
### Getting Rid of CO2 Requires Concentrated Effort

<table>
<thead>
<tr>
<th>Technology</th>
<th>Each option would save one gigatonne of CO2 per year</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Nuclear</strong></td>
<td>Build 130 new nuclear power plants each 1GW in size in lieu of new coal-fired power plants without CO2 capture and storage to supplement the circa 450 nuclear plants globally</td>
</tr>
<tr>
<td><strong>Coal-Fired Generation</strong></td>
<td>Build 320 new zero-emission 500MW coal-fired power plants in lieu of coal-fired plants without CO2 capture and storage (none exist now)</td>
</tr>
<tr>
<td><strong>CO2 Capture In Forestry</strong></td>
<td>Convert to new forest a barren area about the size of Spain, 2.5 times the total land area of the state of Washington, or equivalent to 100 million acres</td>
</tr>
<tr>
<td><strong>Improved Efficiency</strong></td>
<td>Deploy 290 million new cars at 40mpg instead of new cars at 20mpg and assuming 12,000 miles per year</td>
</tr>
</tbody>
</table>

Energy policy under the Obama administration

Policy Directions

- Longer-term policies strongly tied to climate change and alternative fuel proposals
- Infrastructure spending to create jobs
- Oil/gas taxation components implemented via changes in less visible accounting (LIFO to FIFO) and other such tax rules
- New regulations on energy trading activity
- Nuclear power supported, but not enthusiastically
- Renewable energy and electric autos receive strong backing, and renewable portfolio standards and “smart grid” improvements for electric utilities
Shale Gas in the US… an unrecognized CO2 option?

Major US shale basins

Outlook

- Independent natural gas producers are increasingly optimistic about their ability to develop shale plays around the US.
- The Barnett shale in Texas has been a huge success. DOE’s gas supply models may be underestimating the potential strength of domestic production.
- If the industry is successful in conveying the “supply security” message, natural gas could receive favorable treatment from Washington policymakers, but this will take time and effort.

Source: DOE/EIA, DB Global Markets Research
Wave of New LNG Projects in the Pacific Basin

Projects delayed are about to surge onto global markets

Source: Wood Mackenzie, DB Global Markets Research

Outlook
- Many Pacific Basin projects are starting up considerably later than originally expected
- As production ramps up then Asia will become more self-sufficient
- This suggests a substantial drop in cargoes moving from Atlantic to Pacific
