AEDES (STEGOMYIA) JOSIAHAЕ, A NEW SPECIES OF THE SIMPSONI SUBGROUP (DIPTERA: CULICIDAE)

YIAU-MIN HUANG

Systematics of Aedes Mosquitoes Project, Department of Entomology, Smithsonian Institution, Washington, D.C. 20560.

Abstract.—The adult male and female of Aedes (Stegomyia) josiahae n. sp. from Tanzania are described and illustrated. Diagnostic characters for distinguishing Ae. josiahae from closely allied species are given. The distribution of Ae. josiahae is based on examined specimens. Aedes josiahae is most closely related to Ae. kivuensis Edwards. These two species together with Ae. bromeliae (Theobald), Ae. lilii (Theobald), Ae. simpsoni (Theobald), Ae. strelitziae Muspratt, Ae. subargenteus Edwards, and Ae. woodi Edwards form the simpsonia subgroup within the aegypti group.

Key Words: Culicidae, mosquitoes, Aedes, simpsoni subgroup

A new species of Aedes (Stegomyia), belonging to the simpsoni subgroup of the aegypti group, was discovered among specimens that were misidentified as Aedes (Stegomyia) kivuensis Edwards from the Division of Vector Borne Diseases (DVBD) collection in Nairobi, Kenya. In view of the medical importance of several species in the simpsoni subgroup and the similarity of this new species with Ae. kivuensis Edwards, it is desirable to describe the new species here to make its name available and to avoid future confusion between it and Ae. kivuensis. As nothing is known about its biting habits and potential as a vector of human pathogens, it is hoped that this paper will stimulate investigations on these subjects.

MATERIALS AND METHODS

This study is based on specimens that were borrowed from the following institutions: Musee royale de l’Afrique Centrale, Tervuren, Belgium [CMT] and Division of Vector Borne Diseases, Ministry of Health, Nairobi, Kenya [DVBD]. Distributional records are listed in the following order and format: current country names are in capital letters, administrative divisions, where known, are in italics, and place names have the first letter capitalized.

The terminology follows that of Harbach and Knight (1980, 1981), with the exception of “tarsal claws,” which is retained for “ungues.” The venation terms follow those of Belkin (1962).

Aedes (Stegomyia) josiahae Huang, New Species

Figs. 1–4

Female.—Head: Proboscis bearing dark scales, lacking pale scales on ventral surface, length as long as forefemur; maxillary palp 0.27 length of proboscis, dark, bearing

Prepared by ANSI X39-18
Aedes (Stegomyia) josiahae n. sp. ♂
white scales on apical 0.50 of the total length; pedicel covered with white scales except on dorsal and ventral surfaces; clypeus bare; occiput with few erect forked scales; a row of broad white scales around eye margins; vertex with a median stripe of broad white scales, with broad dark scales on each side interrupted by a lateral stripe of broad white scales, followed ventrally by a patch of broad white scales. **Thorax:** Scutum with narrow dark scales and a distinct, median white spot of narrow scales on anterior promontory, followed by a submedian longitudinal stripe of narrow yellowish scales on each side of midline, reaching to prescutellar area and connecting with prescutellar line of narrow yellowish scales; fossal area with a large patch of broader, crescent-shaped white scales; posterior dorsocentral yellowish lines present, reaching posterior 0.50 of scutum; a patch of narrow white scales on lateral margin just in front of wing root; acrostichal setae absent; dorsocentral setae present; scutellum with broad white scales on all lobes and with a few broad dark scales at apex of midlobe; antepronotum with broad white scales; postpronotum with a patch of broad white scales and a few narrow dark scales dorsally; paratergite with broad white scales; postspiracular area without scales; hypostigmal area without scales; patches of broad white scales on propopleuron, subspiracular area, upper and lower portions of mesokatepisternum, and on meseppimeron; upper mesokatepisternal scale patch not reaching to anterior corner of mesokatepisternum; upper mesepimeral scale patch connected to lower mesepimeral scale patch; lower mesepimeron without setae; meta- meron bare. **Wing:** With dark scales on all veins and without a minute basal spot of white scales on costa; cell R₅ 2.8 length of

Josiahae n. sp.
Fig. 3. *Aedes (Stegomyia) josiahae* n. sp. A, Sternal aspect of the female genitalia; B, Dorsal aspect of IX-tergum; C, Dorsal aspect of VIII-sternum; D, Dorsal aspect of VIII-tergum.
Halter: With dark and pale scales. Legs (Fig. 2): Coxae with patches of white scales; white knee-spot absent on forefemur, present on mid- and hindfemora; forefemur anteriorly with a narrow, white longitudinal stripe on ventral surface in basal 0.40; midfemur with a large white spot on anterior surface about 0.67 from base; hindfemur anteriorly with a broad white longitudinal stripe in basal 0.66 that widens 0.25 from base; foretibia anteriorly dark, with a basal white band; mid- and hindtibiae all dark; fore- and midtarsi with a basal white band on tarsomeres 1, 2; foretarsomere 1 with basal 0.20 white on dorsal surface; foretarsomere 2 with basal 0.40–0.50 white on dorsal surface; midtarsomere 1 with basal 0.30–0.33 white on dorsal surface; midtarsomere 2 with basal 0.40 white on dorsal surface; hindtarsus with a basal white band on tarsomeres 1–3, the ratio of length of white band on dorsal surface to the total length of tarsomere is 0.25, 0.20–0.25, and 0.25; hindtarsomere 4 all white, with a few dark scales at apex on ventral surface; hindtarsomere 5 all white, with a few dark scales at apex on ventral surface; fore- and midlegs with tarsal claws equal, all toothed; hindleg with tarsal claws equal, both simple. Abdomen: Tergum I with white scales on laterotergite and with a median white spot; terga II–VI each with a basal white band

Fig. 4. Aedes (Stegomyia) josiahae n. sp. Tergal aspect of the male genitalia.
Aedes (Stegomyia) kivuensis Edwards ♀
and basolateral white spots not connecting with basal white band; terga VII, VIII each with basolateral white spots only; sterna III–VII each with a basal white band; segment VIII largely retracted. Genitalia (Fig. 3): Apical margin of sternum VIII with a median notch and with rounded lateral lobes; insula longer than wide, with minute setae and with 9 larger setae on apical 0.25; tergum IX broader than long, apical margin of tergum IX with well developed lateral lobes, each with 4 setae; apical margin of postgenital plate with a shallow median notch; cercus short and broad; 3 spermathecae, one larger than the other 2.

Male (Fig. 1).—Essentially as in the female, differing in the following sexual characters: Head: Maxillary palpus 5-segmented, as long as proboscis, predominantly dark, with a white band at base of palpomeres 2–5; those on palpomeres 4, 5 dorsally incomplete; palpomeres 4, 5 subequal, slender, dorsally curved and with only a few short setae; antenna plumose, shorter than proboscis. Wing (Fig. 1C). Cell R, 3.1 length of R_{2+3}. Legs (Fig. 1D): Midfemur with a large white spot on anterior surface 0.65–0.67 from base; hindfemur anteriorly with a broad white longitudinal stripe in basal 0.60–0.61 that widens 0.22 from base; foretarsomere 1 with basal 0.20–0.25 white on dorsal surface; foretarsomere 2 with basal 0.50 white on dorsal surface; midtarsomere 1 with basal 0.33 white on dorsal surface; midtarsomere 2 with basal 0.50 white on dorsal surface; hindtarsus with a basal white band on tarsomeres 1–3, the ratio of length of white band on dorsal surface to the total length of tarsomere is 0.25–0.30, 0.25–0.33, and 0.33; fore- and midlegs with tarsal claws unequal, all simple. Abdomen (Fig. 1E, F): Tergum II with basolateral white spots only; sternum VIII with basolateral white spots only. Genitalia (Fig. 4): Gonocoxite 2.2–2.4 as long as wide (width measured 0.5 from base), scales restricted to dorsolateral, lateral and ventral surfaces, with setae on dorsomesal surface, mesal surface membranous; clasper large, broad, reaching to 0.54 of gonocoxite, distal expanded portion square in shape in dorsal aspect, with numerous simple setae on the expanded distal portion and bearing 2(1–2) stronger, basally widened spine-like setae on the apicomesal angle; gonostylus simple, elongate, about 0.66 length of gonocoxite, with a short claw process at apex and with a few setae on apical 0.25; aedeagus strongly toothed; paraproct with a sternal arm; cercal setae absent; apical margin of tergum IX deeply concave medially, with 5–7 setae on each lateral lobe; sternum IX without setae.

Pupa and larva.—Unknown.

Type data.—Holotype male (MEP Acc. 808/#157/Tanganyika, 60–70 km. south of Ifakara, Dr. H. Briegel) with genitalia on slide (8 1/2), Ifakara, TANZANIA (Tanganyika), no date (H. Briegel). Deposited in Division of Vector Borne Diseases, Ministry of Health, Nairobi, Kenya. Allotype female (MEP Acc. 808/#157), same data as holotype [DVBD]. Paratypes: 1 male (MEP Acc. 808/#160) with genitalia on slide (81/22) and 1 female (MEP Acc. 808/#154) with genitalia on slide (81/23), same data as holotype [DVBD].

Other material examined.—TANZANIA (Tanganyika). Morogoro Region: Ifakara (8°08'S, 36°41'E), Mselezi (8°46'S, 36°42'E), H. Briegel, 1 F (#146) [DVBD].

Distribution.—This species is presently known only from Tanzania (Tanganyika).

Etymology.—This species is named to honor Mrs. Phoebe A. O. Josiah, Senior Entomologist, Division of Vector Borne Diseases, Ministry of Health, Nairobi, Ke-
nya, in recognition and appreciation of her contributions to our knowledge of the mosquito fauna of Africa.

Taxonomic discussion.—*Aedes (Stegomyia) josiahae* is a member of the *simpsoni* subgroup of the *aegypti* group. The *simpsoni* subgroup presently comprises at least eight species (*Ae. simpsoni* (Theobald) 1905, *Ae. lili* (Theobald) 1910, *Ae. bromeliae* (Theobald) 1911, *Ae. woodi* Edwards 1922, *Ae. subargenteus* Edwards 1925, *Ae. kivuensis* Edwards 1941, *Ae. strelitziae* Mustratt 1950 and *Ae. josiahae* n. sp.) and is characterized by the following combination of characters: the scutum has a pair of submedian stripes, a white knee-spot is absent on the forefemur but present on the mid- and hindfemora; midfemur has a large, white spot on the anterior surface and the hindtarsus has a basal white band on tarsomeres 1–3. *Aedes josiahae* differs from all other members of the *simpsoni* subgroup except *Ae. kivuensis*, however, by the following combination of characters: (1) scutum with anterior median white spot of narrow scales; (2) scutellum with broad white scales on all lobes; (3) hindtibia anteriorly dark, without a white stripe in basal area; (4) hindtarsomeres 4 and 5 entirely white.

*Aedes josiahae* is most closely related and similar to *Ae. kivuensis*, and I consider *josiahae* to be a sister species of *kivuensis*. Adults of *Ae. josiahae* are extremely similar to those of *Ae. kivuensis* with which it has been confused and misidentified. *Aedes josiahae* can be distinguished easily from *Ae. kivuensis*, however, by the hindfemur, which anteriorly has a broad white stripe in basal 0.60–0.66 and by the presence of a median white spot on tergum I. In *Ae. kivuensis*, the hindfemur anteriorly has a broad white stripe on the basal half, and has a white spot about 0.62 from the base (the white spot does not connect with the basal white stripe) and the tergum I has white scales only on the laterotergite (see Fig. 5).

The male genitalia of *Ae. josiahae* are easily differentiated from all other species in the *simpsoni* subgroup by the claspette, which has the distal expanded portion square in the dorsal aspect, with numerous simple setae on the expanded distal portion and bearing 2(1–2) stronger, basally widened spine-like setae on the apico medial angle.

Gerberg and Van Someren (1970: 2) reported that *Ae. (Stg.) kivuensis* was collected in Tanzania by Dr. H. Briegel of the Swiss Tropical Institute at Ifakara. However, the specimens from Tanzania (Dr. H. Briegel) in the DVBD collection are not *Ae. kivuensis*, but are the new species *josiahae*.

*Aedes josiahae* is apparently an East African lowland species. Based on the present collection data, *Ae. josiahae* occurs in habitats with altitudes of 500 m (1500 ft) and yearly rainfall of 88.90 cm (35 in.). *Aedes kivuensis* is presently known only from Zaire (Belgian Congo), where it occurs in habitats with altitudes of 2166 m (6500 ft) and yearly rainfall of 152.40 cm (60 in.).

Medical importance.—Unknown. However, the *simpsoni* subgroup is one of the most important subgroups of *Stegomyia* from the standpoint of transmission of pathogens. *Aedes bromeliae* is an important vector of yellow fever virus in East Africa. *Aedes simpsoni* was incriminated in the transmission of yellow fever virus during an outbreak of yellow fever in Bwamba County, Uganda, in 1941 and yellow fever virus has been isolated from wild caught mosquitoes (*Ae. simpsoni*) from Bwamba, Uganda, (Mahaffy et al. 1942). The yellow fever virus has also been isolated from wild caught mosquitoes (*Ae. simpsoni*) in Uganda by Smithburn and Haddow (1946). However, the species from which Mahaffy et al. (1942) and Smithburn and Haddow (1946) isolated yellow fever virus was *Ae. bromeliae*, not *Ae. simpsoni* (see Huang 1986). *Aedes simpsoni* (probably *Ae. bromeliae*) from Nigeria has been shown to be a laboratory transmitter of yellow fever (Philip, 1929). *Aedes strelitziae* from South Africa can transmit yellow fever virus from one rhesus monkey to another under labo-
ratory conditions, as shown by Gillett and Ross (1953).

ACKNOWLEDGMENTS

I express my sincere appreciation to Wayne N. Mathis, Department of Entomology, Smithsonian Institution, and Ronald A. Ward and E. L. Peyton, Walter Reed Biosystematics Unit, for critically reviewing this manuscript and for their valuable comments. I am most grateful to J. Decelle and E. De Coninck, Department of Zoologie, Section d'Entomologie, Musee Royale de l'Afrique Centrale, Tervuren, Belgium, for the loan of the holotype of *kivuensis* Edwards used in this study; to J. M. D. Roberts, Davy K. Koeh (formerly of DVBD) and Mrs. Phoebe A. O. Josiah, Division of Vector Borne Diseases (DVBD), Ministry of Health, Nairobi, Kenya, for the loan of the specimens described above, and for their cooperation and kind assistance during the course of the museum and field studies on African *Stegomyia* mosquitoes in Kenya. I also express my gratitude to Young T. Sohn and Vichai Malikul, formerly of the Medical Entomology Project, for preparing the illustrations.
