The Millennium Cohort: a 21-Year Contribution to the Understanding of Military and Veterans’ Health

Second Annual Trauma Stress Disorders Conference
Natcher Auditorium, NIH

December 10, 2009
**The Millennium Cohort: a 21-Year Contribution to the Understanding of Military and Veterans’ Health**

Naval Health Research Center, DoD Center for Deployment Health Research, San Diego, CA, 92106-3521

Approved for public release; distribution unlimited
Deployment Health Research

Lessons learned from 1991 Gulf War
The Origins of the Millennium Cohort Study

- IOM recommended coordinated prospective cohort study of service members
  - Capitalize on new DoD surveillance and health care data
  - Data sources that were not available at the time of the Gulf War
- For the first time, measure the impact of deployment prospectively

Section 743 of the FY1999 Strom Thurmond Act authorized the Secretary of Defense to establish a longitudinal study to evaluate data on the health conditions of members of the Armed Forces upon their return from deployment.
Background

- The Millennium Cohort Study is a longitudinal study designed to evaluate long-term subjective health and chronic diagnosed health problems, especially in relationship to exposures of military concern and deployments.

- All services, active duty Reserve/National Guard.

- Participants are re-surveyed at 3-year intervals including after service through 2022.

- New accession cohorts were added in FY2004 and FY2007.

- New accessions planned for FY2010, including a family component.
Basic Methodology

- Survey refined based on focus group testing, pilot study, and expert review
- Questionnaire leverages standard instruments (PHQ, PCL, SF-36V, others)
- Includes measures of physical health, behavioral health, mental health
- Includes exposure questions, and other metrics (deployment, sleep, etc.)
- Participants respond via traditional paper, or over secure website
2001: Study launched
    77,047 enrolled in Panel 1 (Wave 1)
2004: Panel 1 follow-up and Panel 2 enrollment initiated
    86,131 enrolled / followed-up
2007: Panel 1 and 2 follow-up; Panel 3 enrollment
    ~ 115,000 enrolled / followed-up
2010: Panel 1, 2, and 3 follow-up; Panel 4 enrollment
    Follow-up on > 150,000

- > 70% with at least 1 follow-up
- ~ 50% deployed in support of operations in Iraq and Afghanistan
- ~ 20% have left military service
- > 30 peer-reviewed publications
- > 150 scientific presentations with many awards
DoD and VA Data Sources

- Immunization Data
- Deployment Data
- Pharmacologic Data
- Recruit Assessment Program
- Medical History
- Induction
- Demographic Data
- Environmental Exposure Data
- Mortality Data
- Family Data (e.g., DoD Birth and Infant Health Registry)
- Civilian Inpatient and Outpatient Care
- Military Inpatient and Outpatient Care
- Survey Data
- DoD Serum Repository
- Dept of Veterans Affairs Data
PTSD and Depression

- **PTSD Checklist-Civilian Version (PCL-C)**\(^2\)
  - 17-item self-report measure (Likert 1 to 5)
  - PTSD if moderate or above level of at least one intrusion symptom, three avoidance symptoms, and two hyperarousal symptoms
  - And a score of 50 or more (range 17 to 85)

- **PRIME-MD Patient Health Questionnaire (PHQ)**\(^1\)
  - Psychosocial assessment based on scores of several health concepts
  - Major depressive syndrome (9 items)
  - Panic syndrome (15 items)
  - Other anxiety syndrome (6 items)
  - Eating disorders (4 items; binge and bulimia nervosa)

Has your doctor or other health professional EVER told you that you have any of the following conditions?

...  
PTSD  
Depression  
...

(\(^1\)Spitzer, 1994; Spitzer, 1999; Spitzer, 2000)\(^1\), (Weathers, 1993; Blanchard, 1996)\(^2\)
At baseline, the weighted prevalence of PTSD was 3.6%
- 1.2% reported PTSD diagnosis without current symptoms
- 2.0% had PTSD symptoms without reported diagnosis
- 0.4% reported PTSD diagnosis with symptoms

Those with PTSD at baseline were more likely to be:
- Women
- Less educated
- Never married or divorced
- Current smokers
- Problem alcohol drinkers

## Baseline PTSD Prevalence

<table>
<thead>
<tr>
<th>Millennium Cohort N = 74,947</th>
<th>PTSD diagnosis without current symptoms N = 951</th>
<th>No PTSD diagnosis with current PTSD symptoms N = 1,487</th>
<th>PTSD diagnosis with current PTSD symptoms N = 284</th>
</tr>
</thead>
<tbody>
<tr>
<td>Functional health</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>MCS, weighted mean (95% CI)</td>
<td>53.0 (52.9, 53.1)</td>
<td>48.5 (47.8, 49.3)</td>
<td>27.4 (26.8, 28.1)</td>
</tr>
<tr>
<td>PCS, weighted mean (95% CI)</td>
<td>53.4 (53.2, 53.6)</td>
<td>50.0 (49.3, 50.7)</td>
<td>48.0 (47.3, 48.7)</td>
</tr>
</tbody>
</table>

- **Those with PTSD symptoms (2.4%)**
  - Significantly less favorable PCS and MCS scores

- **Those with reported PTSD diagnosis without symptoms (1.2%)**
  - Lower scores but closer to overall Cohort means
New-Onset PTSD

New-onset PTSD symptoms or diagnosis, over the approximate 3 year period between baseline and follow-up, was identified in:

- 7.6% - 8.7% of those who deployed with combat
- 1.4% - 2.1% of those who deployed without combat
- 2.3% - 3.0% of those who did not deploy

Persistent PTSD

Persistent PTSD symptoms or diagnosis, over the approximate 3 years between baseline and follow-up, was identified in:

- 43.5% - 47.9% of those who deployed with combat
- 22.4% - 26.2% of those who deployed without combat
- 45.9% - 47.6% of those who did not deploy

Photo source: http://www.defenselink.mil/multimedia
Prior Assault and New-Onset PTSD

- New-onset PTSD symptoms or diagnosis among combat deployers was identified in:
  - Women
    * 21.7% of women who reported prior assault
    * 10.1% of women who did not report prior assault
  - Men
    * 12.4% of men who reported prior assault
    * 5.9% of men who did not report prior assault

- In contrast to hypotheses that survival from trauma represents or confers resilience, these findings suggest vulnerability to combat stress and PTSD among survivors of prior assault.

Vigorous physical activity was associated with decreased odds of new-onset and persistent PTSD symptoms.

Light/moderate exercise at follow-up was also associated with decreased odds of new-onset PTSD symptoms.

Those with new-onset PTSD symptoms experienced a 3-4 lb weight gain over those with no PTSD symptoms.

New-onset and persistent PTSD symptoms in nondeployed was associated with weight gain over those with resolved or no PTSD symptoms.

Herbal therapy and megavitamin use significantly more prevalent among participants with PTSD symptoms.
## PTSD or Any Mental Health Diagnosis Among Those with PTSD Symptoms

<table>
<thead>
<tr>
<th>PTSD Symptoms*</th>
<th>Dx code from time of symptom at</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 year</td>
</tr>
<tr>
<td>2001-2003</td>
<td>(%)</td>
</tr>
<tr>
<td>N = 1876</td>
<td></td>
</tr>
<tr>
<td>PTSD dx (ICD-9-CM code 309.81)</td>
<td>2.3</td>
</tr>
<tr>
<td>Any mental health dx (codes 290-319x)</td>
<td>26.4</td>
</tr>
</tbody>
</table>

*PTSD sensitive criteria among Panel 1 baseline participants

- A relatively small percentage received a PTSD-specific diagnosis through their care in the military health system within 5 years
- Nearly half received any mental health diagnosis within 5 years
- Among those with PTSD symptoms and subsequent PTSD diagnosis code
  - ~ 2/3 had persistent PTSD symptoms at 3-year follow-up
  - ~ 1/3 had resolved PTSD symptoms at 3-year follow-up
Alcohol Problems

- Factors most strongly predictive of alcohol problems included younger age, smoking, and prior alcohol problems.
- Reserve/Guard with reported combat exposures at increased odds of heavy weekly drinking, binge drinking, and alcohol-related problems.
- Results consistent between men and women.
- Results consistent across service branches.

Smoking

- Deployment associated with an increase in smoking
  - Increase predominantly due to smoking reuptake rather than smoking initiation
  - Among past smokers, deployment with combat, deploying multiple times, and deployment >9 months increased risk of smoking reuptake
  - Among baseline smokers, deployment not associated with increased amount of smoking

New-Onset Depression

- New-onset depression symptoms:
  - 5.7% of men and 15.7% of women who deployed with combat
  - 2.3% of men and 5.1% of women who deployed without combat
  - 3.9% of men and 7.7% of women who did not deploy
  - Deployed men and women who reported combat exposures had a significantly increased risk for depression compared with nondeployed service members
  - In contrast, deployed men and women who did not report combat exposures were at significantly lower risk for depression than nondeployed men and women

Wells TS, LeardMann CA, Fortuna SO, Smith B, Smith TC, Ryan MAK, Boyko EJ, Blazer D, for the Millennium Cohort Study Team. A prospective study of depression following combat deployment in support of the wars in Iraq and Afghanistan. 2009; AJPH, In press.
Limitations of Presented Studies

- Millennium Cohort is a random sample of the military population that may not be representative of all military personnel or those who deploy.
- Those who were ill may have declined or participated in follow-up at different levels biasing new-onset estimates.
- Self-reported exposure assessment is limited and not specific to deployment.
- Use of a mental health screen as a surrogate for clinician diagnosis is imperfect.
Strengths of Presented Studies

- 71% follow-up
- Prospective investigations of specific characteristics and select populations possible from a large population-based sample of all services and components
- Preliminary findings investigating follow-up non-response did not find significant differences in measures of effect for PTSD after adjusting for non-response
- Self-reported mental health symptoms may be a better representation of symptom prevalence than diagnoses in medical databases
Conclusions

- Combat exposures, rather than deployment itself, significantly affect onset of mental health symptoms, problem alcohol drinking, and cigarette smoking post-deployment.
- Significant amount of newly reported smoking and problem drinking associated with newly reported mental health symptoms post-combat deployment.
- Specific populations including those with poor mental and/or physical health, and prior stressful life events could be targeted for PTSD prevention programs.
