ABSTRACT

The earthquake that struck Haiti in the afternoon of January 12, 2010 devastated the nation and left the cities of Haiti in a state of ruin. Tens of thousands were killed in the wreckage, and survivors were left without the basic necessities of life. The world quickly responded with a massive outpouring of aid. However, due to the destruction of the infrastructure of Haiti, the coordination of this aid was challenging. The All Partners Access Network (APAN), an online information exchange and collaboration tool, proved useful in bringing together many aid groups, including several U.S. government entities, to effectively address Haiti’s multitude of immediate and long-term needs. The APAN data recorded the collaboration that occurred between its users. The goal of this thesis is to utilize the data as a real-world example of how teams work together on unique, complex problems. The data was coded and analyzed with the objective of empirically evaluating the Office of Naval Research model of team collaboration. The model describes the individual and team cognitive processes, occurring during team collaboration, which facilitate decision making in seeking solutions to multifaceted, unique, and complex problems.

ACKNOWLEDGMENTS

We wish to thank Susan Hutchins for providing indispensable course corrections, without whose guidance this thesis would have quickly floundered. To Abigail Lysne and the Lysne children, thank you for your ever-present support, supply of motivation, and sacrifice of your time which allowed us to complete this thesis. Thanks to Alfred, Elizabeth and Amanda Ortega; Peter Beas and Wen Ping Huang for all of their love, support and encouragement. We also thank Colonel Robert Burks, who patiently filled our gaps in statistical knowledge.
THIS PAGE INTENTIONALLY LEFT BLANK
I. INTRODUCTION

A. BACKGROUND

On January 12, 2010, at 1653 local time, a 7.0-magnitude earthquake rocked the nation of Haiti. The epicenter of the quake was located near the city of Léogâne, 16 miles west of the nation’s capital of Port-au-Prince. It was a shallow quake occurring only six miles beneath the surface. To an observer on the ground the quake struck with an equivalent force of 35 Hiroshima bombs (Tremor Struck with the Force of 35 Hiroshimas, 2010). The death toll has been estimated at 220,000. The country’s loose building codes contributed to the disaster. It has been said that earthquakes do not kill people but buildings do. That is certainly the case in Haiti. The amount of rubble generated from the disaster has been estimated at 19 million cubic meters (Haiti One Year Later: The Progress to Date and the Path Forward, 2011). Removing all of this rubble is still a problem even today. The Interim Haiti Recovery Commission’s (IHRC) stated goal for October 2011 is to remove 4 million cubic meters of debris (Haiti One Year Later: The Progress to Date and the Path Forward, 2011), less than a quarter of the rubble present. Poor building standards were also the result of poor construction, since companies in the area tried to cut down on building cost by adding sand to concrete mixes and using less steel rebar than normally required (“Engineers Blame Havoc on Cowboy Construction Code,” 2010). In fact, a few months after the Haiti disaster, stronger earthquakes occurred elsewhere in Chile and Mexico, but these locations suffered less casualties than in Haiti. These earthquakes were deeper into the earth than the Haiti quake but experts agree that the reason behind the low loss of life in these disasters was due to better building codes in these countries (Edwards, 2010). The amount of debris would later serve as a serious impediment to aid workers trying to access the area since many roads were blocked.

The government of Haiti was devastated by the disaster. All but one ministry building was destroyed in the earthquake and 17% of the federal workforce died (Haiti One Year Later: The Progress to Date and the Path Forward, 2011). This hampered the government’s ability to respond to the disaster. Even the presidential palace was
destroyed, forcing the Haitian president, René Préval, to operate out of a building near the airport. Haiti was a nation that was ill prepared for a disaster of this magnitude. Poverty plagued the nation before the earthquake. Eighty percent of Haitians live below the poverty line and over half of the nation’s population lives on less than $2 a day (Haiti One Year Later: The Progress to Date and the Path Forward, 2011). The country also suffers from political instability. In Haiti’s 200-year history, there have been 32 coups overthrowing the government.

International aid was focused on Haiti in the wake of the disaster. However, it immediately became clear that coordinating the relief efforts of the various aid organizations was going to be difficult. The number of relief organizations involved in the Haiti relief effort was immense. Non-Governmental Organizations (NGOs) such as Doctors without Borders were present in Haiti in addition to state sponsored organizations. Canada sent a team of search and rescue personnel in the first few days of the disaster, as well as the Chinese, among many others nations. All of these organizations had different objectives, equipment needs, and operating procedures. The United Nations (UN) could not effectively serve as a coordination body immediately following the earthquake since their local mission was also devastated in the disaster. The United Nations Stabilization Mission in Haiti (MINUSTAH) has operated out of Haiti since 2004. MINUSTAH’s headquarters building collapsed during the quake killing the mission’s leader and a large portion of the mission’s staff, severely impacting the UN’s ability to respond to the disaster. Language was another reason coordination was difficult. Aid workers in many of these organizations spoke different languages and could not easily operate with each other. The largest language barrier was with the local population. A majority of the nation’s citizens speak Haitian Creole which is based on French. However, the language has evolved from French to such a large degree that many French speakers have difficulty understanding it.

U.S. relief efforts were led by the U.S. Agency for International Development (USAID). The agency’s mission is to provide foreign assistance to expand democracy and improve the lives of citizens in the developing world (About U.S. AID, n.d.). Numerous other government agencies also contributed to the disaster relief efforts
including the U.S. Coast Guard, the Federal Aviation Administration, and Department of State among many others. The Department of Defense response to the disaster was led by Joint Task Force Haiti (JTF Haiti), a subordinate command to U.S. Southern Command (SOUTHCOM), in an operation called Unified Response. JTF Haiti responded quickly to the disaster providing security forces on the ground and vital relief supplies within days after the quake struck. By January 22, 2010, the U.S. military had 13,657 personnel operating in the area (Narrative History of Operation Unified Response, 2010).

B. ALL PARTNERS ACCESS NETWORK

The All Partners Access Network (APAN) is an internet-based tool which was used in the Haiti relief effort to facilitate collaboration among the various aid organizations. The site consists of forums, wikis, chats and blogs that enable users to make requests for services, share information and ask or answer questions about relief operations. It is an unclassified site that can be accessed by all aid workers. Over 1700 different individuals utilized the site during the relief effort (Pierce, 2010). The iteration of APAN utilized in the Haiti relief operation was called Transnational Information Sharing Cooperation (TISC). This version of APAN was created in 2008 to meet the needs of the U.S. Pacific Command (PACOM). PACOM oversees a vast operational area with many different countries. The goal of this tool was to facilitate the free flow of information between relief organizations and the military throughout PACOM’s Area of Responsibility (AOR) (Ives, 2010). In particular, the site was to be used in areas without sophisticated technical capabilities. A working internet connection is all that is required to use the site. The system was not in full operation before the Haiti earthquake. In fact, it was simply being demonstrated to SOUTHCOM, who decided to immediately put it to use in Haiti. Interestingly, a test for the site was scheduled for summer 2010 that was to revolve around a simulated hurricane that stuck Haiti and the Dominican Republic (Pierce, 2010).

The simplicity of the site was one of the major reasons for its adoption among aid workers. The site was designed to be easy to use in order to facilitate use by personnel who may not be technologically savvy (Pierce, 2010). Another benefit of this tool is that
it enables relief providers to advertise their services allowing the user to pick and choose what they need. An example of this was with the Sacré Coeur hospital in Milo, Haiti. The hospital was not damaged in the earthquake, but many people did not know this and thus the hospital was severely underutilized. The hospital admitted only 6 people in the four days following the disaster. Hospital personnel announced the availability of beds on APAN and the U.S. military responded by airlifting severely injured patients to the hospital and increasing its hospital admittance to 250 within a few days (“Technology Links Medical Aid and Survivors,” 2010).

For the research conducted for this thesis we analyzed team collaboration efforts that occurred on APAN. Most of the data came from the forum section of APAN. This section allows users to discuss specific topics in a threaded dialog chain. Users can post a question or raise an issue in the forum, which can later be answered by other users in the same thread. This method of organizing issues of related content provides an easy way to navigate between topic threads. The forum section was also used to share information such as contact emails and phone numbers or information about the availability of relief supplies.

C. GOALS OF THIS STUDY

The goal of this study was to empirically evaluate the macrocognition model of team collaboration developed by the Office of Naval Research (ONR) under the Collaboration and Knowledge Integration (CKI) program. This study involved an empirical evaluation of the model using data from the real-world event of the 2010 Haiti earthquake. The CKI program model of team collaboration was developed to gain insight into the collaboration by teams during problem solving scenarios. The purpose of this research program is to better understand the cognitive processes that teams engage in as they gather and process information. For this thesis we analyzed data from two themes in the APAN data, which were security and relief logistics. Utilizing data from these themes provided the opportunity to evaluate the model using data from a real-world event. The data from these two themes was separated into individual thought units on separate lines. A thought unit refers to a “sequence of a few words conveying a single thought” (Weldon, Jehn, & Pradham, 1991, p. 559) or as “the smallest message unit that
can stand alone” (Keyton & Beck, 2010, p. 336). A user’s single instance of communication generally consisted of more than one thought unit. For example a user may have asked a question, made a request and provided contact information in the same post to the site. These ideas were separated into different lines. The content of each line, or thought unit, were then assigned a code in accordance with the definitions of the macrocognitive process included in the model.

D. SECURITY

There was a great need for security after the earthquake occurred. The walls to the national penitentiary collapsed allowing thousands of prisoners to escape. Some of these prisoners still have not been caught since the government kept poor records of inmate’s physical descriptions (Genzlinger, 2011). Security has always been an issue in Port-au-Prince, particularly in Haiti’s largest slum Cité Soleil. This slum has been described as one of the most dangerous places on earth since many criminals operate there (Haviv, 2006). It is located adjacent to the western end of the runway at the Toussaint Louverture International Airport, which was the hub of all relief activities in Haiti. Security was also needed at the food distribution centers to ensure all Haitians received an equal share of food and to prevent mobs from forming. In several instances, older women and children were pushed away by stronger individuals who rushed towards aid delivery trucks (Sawer, 2010). Looting was another issue as massive mobs openly raided stores in search of food. Instances of abuse against women and children increased dramatically in the wake of the disaster (Lakhani, 2011). All of these issues required a security presence in the area to maintain law and order.

E. RELIEF LOGISTICS

The relief logistics thread in the APAN data covers a wide range of topics from transportation of food and water to issues such as adoptions. Numerous relief organizations had difficulty bringing supplies to Haiti since the Toussaint Louverture airport was overwhelmed with flights. The Haitian government had difficulty controlling the airport in the wake of the disaster, so they turned over responsibility for airport operations to the U.S.. U.S. military personnel found a chaotic scene at the airport upon
arrival. However, they were able to get the airport operational a day after the earthquake. Nevertheless, the airport still suffered from several difficulties. There were simply too many planes requesting permission to land in the first few days of the disaster and not enough space available to land them. There was also a lack of space available to unload arriving aircraft of their contents. Many flights arrived at the airport unannounced and were forced into a holding pattern that grew to five miles in height (Gyokeres, 2010). Many flights had to be diverted to other airfields early in the disaster. This was a problem since the airport was one of the few points of entry into the country. The nation’s main seaport was severely damaged and was not immediately available for use. Three of the shipyard cranes had collapsed and the harbor was filled with debris such as cargo containers (Robson, 2010). Many aid workers and journalists were forced to fly to airports in the Dominican Republic and then cross the Haitian border via car. The damage to Haiti’s transportation network increased the complexity of aid work.

F. TIMELINE

- 12 January 2010
  - A 7.0 magnitude earthquake strikes Haiti. The epicenter was located near the city of Léogâne and struck at 1653 local time.

- 13 January 2010
  - First elements of Department of Defense (DoD) humanitarian assistance arrive in Haiti at dawn.
  - 1st Special Operations Wing arrives in Haiti and reopens the Toussaint Louverture International Airport. U.S. military aircraft immediately begin to deliver relief supplies.
  - Coast Guard cutter Higgins arrives to start evacuating American citizens.
  - A 17 person USAID Disaster Assistance Response Team (DART) arrives in Haiti to assess humanitarian needs and to coordinate relief efforts with the Haitian government.
  - Search and rescue teams from local U.S. communities including Fairfax County, VA, and Los Angeles County, CA, arrive in Port-au-Prince to look for survivors.
• U.S. Ambassador to Haiti, Kenneth H. Merten, declares a state of emergency in Haiti allowing funds to be utilized to provide immediate assistance.

14 January 2010

• U.S. SOUTHCOM establishes Joint Task Force – Haiti and designates it as the lead command and control organization for the DoD’s relief efforts.

15 January 2010

• United States aircraft carrier USS Carl Vinson arrives off the coast of Haiti to assist in relief efforts.
• U.S. government announces a special immigration status for Haitians living in the U.S. which protects them from deportation for 18 months.
• Russian search and rescue teams cease all activity at night due to looting and other insecurity in the area.

16 January 2010

• Haitian President René Préval meets with Secretary of State Hillary Clinton and USAID Administrator Raj Shah along with other U.S. government officials in Haiti to discuss relief operations.

19 January 2010

• U.S. SOUTHCOM establishes Joint Logistics Command Haiti to coordinate the movement of supplies to Haiti.
• USS Bataan Amphibious Ready Group (ARG) arrives off the coast of Haiti. The ARG includes the 22nd Marine Expeditionary Unit (MEU) and facilities to provide relief supplies and medical care.
• A Canadian team finishes the installation of lights on the runway at the Jacmel Airport in Haiti. This allows for 24 hour flight operations and relieves congestion at the Toussaint Louverture International Airport.

20 January 2010

• The hospital ship USNS Comfort arrives off the coast of Haiti to provide medical assistance.
A 5.9 magnitude aftershock strikes Haiti. This is the largest aftershock since the earthquake.

- **22 January 2010**
  - Total U.S. personnel in the Haiti Joint Operational Area grows to 13,657 personnel with 3,258 personnel ashore and 10,399 afloat.
  - Government of Haiti announces new adoption procedures to protect children leaving the country. These new procedures were intended to prevent the abuse of children and human trafficking.

- **23 January 2010**
  - Haitian government ends its formal search for survivors.

- **25 January 2010**
  - 24th MEU begins to distribute relief supplies to areas around the northwest portion of the capital.

- **28 January 2010**
  - Food distribution continues to be a problem. UN personnel are forced to use rubber bullets and tear gas to disperse mobs at several food distribution centers.

- **5 February 2010**
  - U.S. government’s efforts in Haiti officially transition from Phase I (Emergency) to Phase II (Relief) operations.

- **8 February 2010**
  - Evans Monsignac is rescued from a collapsed building after spending 27 days trapped in the rubble.

- **21 April 2010**
  - Haitian President René Préval announces the creation of the Interim Commission for the Reconstruction of Haiti (IHRC) to help coordinate and prioritize long-term recovery efforts.
• 31 March 2010
  o International Donors Conference: Towards a New Future for Haiti was held in New York City at the United Nations Headquarters. The conference raised funds from numerous organizations to help fund the Haiti recovery efforts.

• 1 June 2010
  o U.S. military announces the end of major relief operations in Haiti. A 500 man force of U.S. National Guard Troops remain in Haiti until September to provide additional support.
II. LITERATURE REVIEW

A. COGNITION

As this thesis focuses on aspects of the workings of the human mind, it would be well to discuss some of the academic underpinnings of the concepts used in this study. Philosophers and scientists have long been curious about the ways in which humans perceive, process and transmit information. In other words, they endeavored to understand human cognition.

1. Historical Views—Two Brief Examples

   a. David Hume

   David Hume, the eighteenth-century Scottish philosopher and historian, is considered by many philosophers to be a precursor of modern cognitive science (Morris, 2009). Hume viewed the study of human understanding as necessary to the good of humankind and having a liberating effect upon the mind. “The only method of freeing learning…is to enquire seriously into the nature of human understanding…We must submit to this fatigue, in order to live at ease ever after” (Hume, 1777, section 1, subsection 7).

   To Hume, human understanding required deep exploration and enquiry. He also believed that careful scientific study, in spite of the difficulties sure to be encountered, would produce a certainty of knowledge in the subject of human cognition. “It becomes, therefore, no inconsiderable part of science barely to know the different operations of the mind, to separate them from each other, to class them under their proper heads, and to correct all that seeming disorder, in which they lie involved, when made the object of reflexion and enquiry…But may we not hope, that philosophy, if cultivated with care, may carry its researches still farther, and discover, at least in some degree, the secret springs and principles, by which the human mind is actuated in its operations? …that, if it lie within the compass of human understanding, it may at last be happily achieved; if not, it may, however, be rejected with some confidence and security” (Hume, 1777, section 1, subsections 8 & 9).
b. Immanuel Kant

The German philosopher, Immanuel Kant, is credited with laying many of the fundamental principles of cognitive science (Brook, 2008). Though he is acknowledged to have developed much of his work on epistemology as a response to David Hume (Brook, 2008), he articulated concepts, which remain basic to the study of cognition more than two hundred years after his death (Brook, 2008).

Kant defined his model of cognitive architecture with three main ideas.

(1) The mind is composed of intricate, distinct abilities or functions. To understand the mind, these functions must be observed and described to the greatest accuracy possible (Brook, 2008).

(2) The functions necessary for the generation of knowledge within the mind are the processing of sensory inputs, within the space and time domains, applied to concepts also within the mind (Brook, 2008).

(3) The functions of the mind, necessary for cognition, are forms of synthesis. Examples of synthesis are generation of temporal and spatial structure, association of temporal spatial structures to each other, and it must recognize items, using concepts in the mind (Brook, 2008).

2. Categories

In more modern times, cognition has been broken down into categories based upon what type of thought it describes and where it occurs.

a. Microcognition

Microcognition consists of the most basic building blocks of mental activity and occurs entirely within the mind of the individual (Letsky & Warner, 2008). These are processes that are more commonly studied in the laboratory than in naturalistic settings. Examples of microcognitive processes include perceptions of sensory inputs (sight, sound, taste, smell, touch), installing these perceptions into long and short-term memory storage, and recall of memory. Individuals may possess these faculties to
varying degrees of efficiency. Some may possess more acute eyesight, greater ability to memorize details, or faster recall of memory, but, aside from anomalous cases, all possess these to greater or lesser degrees.

b. Metacognition

Metacognition concerns awareness of cognition. Expressed another way, it is “thought about thought” (Letsky & Warner, 2008). To illustrate how metacognition is theorized to act in the human mind, it could be likened to an overseer who monitors the thought processes and makes judgments as to how well they are going. If they are plodding along inefficiently, the metacognitive overseer may make suggestions to improve them (Smith, Shields, & Washburn, 2003).

Metacognition is a sort of cognitive quality control process. In manufacturing processes, the quality engineer monitors the quality of predetermined parameters. If any of these parameters exceed specified values, the process is deemed out of control and the quality engineer may suggest corrections. In like manner, metacognition in the human mind makes adjustments to facilitate efficient cognition (Smith et al., 2003).

3. Macrocognition

Macrocognition is a much broader topic. It draws from many academic disciplines, including psychology, computer science, philosophy, business management, and mathematics (Letsky, Warner, Fiore, & Smith, 2008). Wroblewski and Warner defined it as “the high-level mental processes, both external and internal, used by team members while engaged in collaborative problem solving” (Wroblewski & Warner, 2008, p. 353).

For the purpose of this thesis, two current constructs of macrocognition are discussed. Fiore et al. presented a five-dimensional model of macrocognition in teams that focused on the knowledge building process (2010), while Klein described the functions and supporting processes of macrocognition built up around naturalistic decision making (Schraagen, Klein, & Hoffman, 2008).
**Fiore et al. Macrocognition Model**

The Fiore et al. model is described in Table 1. (Note that this table only shows the first four dimensions of the model, with the fifth dimension being the outcome of the other four dimensions.)

#### b. **Klein Macrocognition Model**

In a slightly different paradigm, macrocognition was posited as the framework for naturalistic decision making. Specifically, it emerged in the study of cognitive processes in naturalistic settings (Schraagen et al., 2008) and was related to the Recognition-Primed Decision-Making (RPD) model presented by Klein et al. (Klein, 1998).

Naturalistic Decision Making (NDM) is best defined by first describing what it is not. In what can be termed “classical” decision-making methods, the participants first gather information on the problem. Then they formulate solution options to the problem. This is followed by determining relevant parameters for the options and assigning each a level of importance, or weight. After grading the parameters of each option, the option scores are tallied. The option with the highest score is deemed the best solution to the problem (Klein, 2008).

This method was studied for decades, but difficulties remained in relating it to how people actually made decisions outside of the laboratory. It was assumed that the classical method was optimal and most field research focused upon how to improve the decision-making process of real people. When it began to dawn upon researchers that subjects with significant levels of expertise never made decisions optimally, but yet consistently made good decisions, it became obvious that a different approach was required (Klein, 2008).

Research then shifted its focus to discovering how experts actually made decisions in real world, or naturalistic settings. Problem-solving events (such as
firefighting, military C2 tasks, hospital emergency rooms, etc.) were sought where operators were able to make difficult decisions in time-pressured, uncertain, high stakes, ambiguous, unstable conditions with uncertain goals. From this research emerged several models of NDM (Klein, 2008).

Recognition-primed decision making (RPD) is the primary model developed under the NDM paradigm (Klein, 2008). When studying the decision-making processes of firefighters and a wide range of other decision makers under time-pressured, naturalistic, complex, ambiguous settings, Klein et al. came to the conclusion that individuals and teams with significant degrees of expertise did not consciously weigh multiple options before making critical decisions (Klein, 1998). They recognized a given situation as being similar to a prototypical scenario for which they had confidence in the knowledge they knew the correct approach (Klein, 1998). If the situation proved to be other than what was initially perceived, these experts could usually find another prototype scenario similar to the one at hand (Klein, 1998).

Klein’s model of macrocognition is illustrated in Figure 1. The functions on the top half are supported by the processes in the bottom half (Klein, 2010).
B. EMPIRICAL MODEL OF TEAM COLLABORATION

1. Development

In 2003, several theories on team collaboration (as cited in Warner & Letsky, 2008) were incorporated into the first comprehensive model of team collaboration. With the subsequent addition of further unique and overlapping theories, the Preliminary Conceptual Model of Collaboration was synthesized by integrating the various descriptive stages and processes from these related theories (Warner & Letsky, 2008).

a. Macrocognition-Focused Model of Team Collaboration

Further refinement of the model, through better definition of the problem area domain and improved distinction between the collaboration stages, eventually resulted in the macrocognition-focused model (Warner & Letsky, 2008), shown in Figure 2.
(1) Inputs. During formation, the following are provided to the team and determine its characteristics and focus: a description of the problem; team member expertise; organizational structure; roles and responsibilities of each team member; and projected events and future information (Warner & Letsky, 2008).

(2) Collaboration Stages and Cognitive Processes. There are four interdependent stages in the model. These are knowledge construction, collaborative team problem-solving, team consensus, and outcome, evaluation and revision. The stages are not necessarily sequential. Because the process includes feedback from the outcome stage, the entire procedure may become iterative with data, information, and knowledge flowing freely back to cognitive processes employed by the decision maker in previous stages until the final solution is deemed appropriate (Warner & Letsky, 2008).

b. **Measurement-Focused Model of Team Collaboration**

Subsequently, this model was refocused to facilitate measurement and adopted the Burke et al. construct of macrocognition dimensions (see Table 1). This is the current model that was used for this research and is illustrated in Figure 3.

![Model of Team Collaboration: Focus on Measurement](From Fiore, Smith-Jentsch, Salas, Warner, & Letsky, 2010).

Figure 3. Model of Team Collaboration: Focus on Measurement (From Fiore, Smith-Jentsch, Salas, Warner, & Letsky, 2010).

(1) Individual Knowledge Building involves individual team members building their own knowledge, either by internal or external means. Example processes include the following: *Individual Information Gathering (IIG)*, individuals adding to their existing knowledge through direct gathering; *Individual Information Synthesis (IIS)*, individuals developing actionable knowledge by comparing relationships among information, context, and artifacts; and *Knowledge Object Development (KOD)*, individual creation of cognitive artifacts for the purpose of supporting the creation of actionable knowledge (Fiore et al., 2010).

(2) In the Team Knowledge Building stage, team members disseminate information and transform that information into actionable knowledge for other team members. Processes included within Team Knowledge Building are: *Team
Information Exchange (TIE), team members passing relevant information to appropriate teammates; Team Knowledge Sharing (TKS), team members sharing explanations and interpretations with other team members; Team Solution Option Generation (TSOG), team members developing and offering potential solution options; Team Evaluation and Negotiation of Alternatives (TENA), team members clarifying and discussing the pros and cons of potential solutions options; and Team Process and Plan Regulation (TPPR), team members discussing and critiquing the team’s knowledge building process or plan (Fiore et al., 2010).

(3) Internalized Team Knowledge is the sum of knowledge of the individual team members. Its subcomponents are the following: Team Knowledge Similarity (ITK), the level of team members understanding each other’s roles and knowledge of team critical goals and resources; and Team Knowledge Resources (TKR), the team’s collective understanding of resources and responsibilities associated with the task (Fiore et al., 2010).

(4) Externalized Team Knowledge refers to team members explicitly agreeing to, or not openly challenging, facts, relationships, and concepts. The subcomponents of this dimension include the following: Externalized Cue-Strategy Associations (ECSA), team’s collective agreement on task strategies and situational cues that modify these strategies; Pattern Recognition and Trend Analysis (PRTA), team members agreement upon, or lack of challenge to, the accuracy of patterns or trends noted by team members; and Uncertainty Resolution (UR), describing the degree to which a team collectively agrees on the status of problem variables (Fiore et al., 2010).

(5) Team Problem Solving Outcomes refer to assessments of the quality of a team’s problem solutions or plan. This stage contains the following subcomponents: Quality of Plan (QOP)/Problem Solving Solution, refers to the degree that the solution adopted by a problem-solving team achieves a resolution to the problem; Efficiency of Planning Process (EPP), the amount of time it takes the team to arrive at a successful solution to the problem; and Efficiency of Plan Execution (EPE), compares the quality of the plan to the cost of executing it in time and resources (Fiore et al., 2010).
III. METHOD

A. DATA SELECTION PROCESS

1. All Partners Access Network (APAN)

The communication records of the 2010 Haiti earthquake relief effort on the All Partners Access Network (APAN) consisted of blogs, briefings, forum transcripts, and military situation reports. However, the data for this study primarily consisted of the forum transcripts, due to the highly interactive nature of the communications between relief workers displayed therein. These transcripts had been previously separated into themes, according to the primary subjects addressed by the communication, using Lexical Link Analysis (LLA), as described in the following paragraph. For instance, if the subject of the communication was regarding a sewer system, the theme may be “sanitation.” There could also be cases in which more than one theme applied. An example of this would be a communication about the security of food supplies to a hospital. In this case, the themes of “security,” “food,” and “hospital” all may apply.

a. Lexical Link Analysis (LLA)

Lexical Link Analysis (LLA) was used to develop the themes of the APAN data. It is a tool for examining text to determine the dominant themes that exist with the body of text. Based upon the automated parsing of documents, it develops themes from the frequency of occurrence of certain key words (Hutchins, Zhao, & Kendall, 2011). Among the themes that were developed from the use of LLA were “hospital,” “disease,” “security,” and “relief/logistics/NGOs.”

b. Selected Themes

It was desired to use as few themes as possible for our analysis, while still having enough material to conduct a valid study. This was based upon the assumption that themes with more material were more likely to contain deeper and more lengthy
discussions than more meager themes. A second assumption was that deeper, lengthy discussion threads would provide more material for validating the model of team collaboration.

It was known that the process of theme selection could potentially be iterative. First, one theme must be selected. If, after close examination, it was found that the selected theme did not contain enough material for analysis, a second theme would be required. This process would continue until enough material was garnered for the study. With these points in mind, the themes selected were “Security” and “Relief / Logistics / NGOs” (Non-Governmental Organizations).

(1) Security. The security theme contained discussion threads pertaining to security and peripheral issues. These included personal security of Haitian refugees and relief workers, as well as security of food and relief supplies. It also contained the issues of training, manning and equipping of security forces, such as police.

(2) Relief/Logistics/NGOs. All discussion threads regarding delivery and logistics of relief supplies, as well as administrative discussions on NGOs are contained within this theme. This also includes discussions on procedural difficulties that arise from the cultural differences between military organizations and NGOs.

c. Participating Organizations

The data within the themes of security and relief/logistics/NGOs had been entered into the APAN site by a wide array of organizations participating in the relief effort. Table 2 lists these organizations.

B. CODING PROCESS

1. Data Organization

APAN data was generated, stored, and processed in a Microsoft Structured Query Language (MSSQL) database. However, as the authors were more familiar with other software, both in terms of manipulating and presenting data, the data was exported to Excel.

After the themes were selected, the next major step was to assign macrocognitive codes to the material within the discussion threads. A necessary intermediate step was to separate these into individual thought units.

a. Separation of Thought Units

The discussion threads were initially separated only by the persons entering their portions of the discussion into APAN. These could be as short as a single word, or as long as several pages. However, to be coded, the discussion had to be broken down into individual thought units. A thought unit is the smallest message, which can express a complete idea by itself, or a “sequence of a few words conveying a single thought” (Welden, Jehn, & Pradhan, 1991, p. 559) or “the smallest message unit that can stand alone” (Keyton & Beck, 2010, p. 336). Often, sentences express more than one idea. The sentence, “I found that the orphanage was lacking food, but the children were in good spirits,” contains two separate, but related thought units.

2. Practice Coding

To familiarize the coders with the coding process, the authors conducted practice coding on real data from a previous study. This coding was conducted independently on 200 lines of thought units by each coder. The results were then critiqued to determine the best code for each thought unit. This procedure was then repeated on 162 lines of thought units from the Haiti earthquake APAN data. This provided two significant benefits. It gave practice to the coders, which made coding of the actual data less laborious. It also helped solidify code definitions and applicability in the minds of the coders.
3. **Code Assignment Paradigms**

Codes were assigned from both the Fiore et al. and Klein models of macrocognition. Two persons coded independently on all thought units for the Security and Relief/Logistics/NGOs themes. All possible codes from both models were considered, but only the single code from each model deemed most applicable was assigned. After coders completed their independent coding, these code sets were compared. Where there was disagreement, the final code was determined by discussing the reasons for the code assigned, and assigning the code that was judged to be most valid.

**a. Fiore et al. Macrocognition Model Codes**

The macrocognition dimensions from the Fiore et al. model were used, in addition to new codes, which emerged from studies of team collaboration in real-world, high stakes, unique problem sets. These are Decision to Take Action / Request to Take Action (DTA-RTA) and Decision to Take Action / Course of Action (DTA-COA). They are especially applicable to scenarios typically encountered by military, firefighters, police, and emergency workers, in which decisions must be made because lives may be at stake (Hutchins & Kendall, 2010).

The definitions for each of the Fiore et al. codes are shown in Table 3. For actual examples, from the APAN data, of situations and thought units for which each of these codes apply, see Table 4.
Table 3. Macrocognitive Process Definitions for the Fiore et al. Macrocognition Model (Fiore et al., 2010).

Note 2: Thought units for which this code applied were not found in the data.
4. Inter-Rater Reliability

When research is done in which the coding of data contains an element of subjectivity, there is a need to evaluate the quality of the data collection method. Often, data is analyzed and coded by people referred to as raters. It then becomes important to determine the consistency between raters, or in this case, coders, in which the data coding method was applied. Inter-rater reliability refers to the measure of the degree of similarity in data coding method applied by the raters to the same set of data (Gwet, 2008).

a. Cohen’s Kappa Coefficient

Several statistical methods can be used to determine inter-rater reliability. This study used the Cohen’s kappa coefficient. It provides a measure of the degree to which two raters concur in their respective sorting of a given number of items into several mutually exclusive categories (Lowry, 2001). There are several online and downloadable tools to determine the value of the Cohen’s kappa test from a given set of data. This study used the AgreeStat standalone Excel workbook, available for free download from http://agreestat.com/agreestat.html. The code sets were input into the AgreeStat workbook, which then generated the kappa value.

The standard for determination of the quality of the kappa value used for this study is shown in Table 7. These values are based solely upon the professional opinions of Landis and Koch (Landis & Koch, 1977).

IV. RESULTS AND DISCUSSION

A. OVERVIEW

Each author independently coded the APAN data from the Security and Relief Logistics themes. Independent coding of the data allowed each coder to interpret the data individually and without introducing bias upon each other. The Security theme consisted of 722 thought units while the Relief Logistics theme contained 1,260 thought units for a total of 1,982 thought units. The large number of thought units provided each coder with ample examples of communications to analyze to empirically evaluate the model of team collaboration. Selecting two themes from the 40 themes identified by the Lexical Link Analysis (as discussed in Chapter III) allowed each author to focus their analysis of the interagency collaboration between aid workers to only two topics. Appendices A and B contain a complete list of the communications conducted under each theme. Names, email addresses and phone numbers have been redacted for privacy concerns. Subsequent to the authors coding the data individually they met to compare coding assignments. During that meeting the coders discussed their coding of each thought unit and when they disagreed they each presented their reasoning. They were able to reach an agreement on a final code assignment for each thought unit. Both coder’s coding and the final code are included in Appendix A and B.

B. ANALYSIS OF FIORE ET AL. CODES

1. Team Information Exchange

Table 8 provides the percentages of codes assigned to both the Security and Relief Logistics themes. This table is based on the final coding assignments agreed upon by both coders. The code assigned most often in both themes was Team Information Exchange (TIE). The sheer dominance of TIE is apparent. The high usage of TIE was an expected result based on previous research on this topic. A majority of team collaboration in most situations is likely to involve information exchange. Teams operating in dynamic situations need to keep each other informed of the changing environment. Information exchange was a priority in the wake of the Haiti disaster since
many users were unfamiliar with the area or the current situation on the ground. Another reason for the large amount of TIE is due to the fact that information exchange occurs frequently in a forum type atmosphere. Many individuals used the forums in the APAN collaboration system to find information or to post responses to other user’s inquiries. Some examples of the information posted to the forums include flight information and availability of relief supplies. TIE was also used for thought units that presented rhetorical questions. For example, one user wrote “What is One Response?” then proceeded to describe the purpose of the One Response website. These types of posts also increased the instances of the TIE code.

</tr>
</tbody>
</table>
2. Miscellaneous and Non-Codable

The second most frequently assigned code was the Miscellaneous Code (MISC). MISC was used in thought units that did not provide meaningful team collaboration. Thought units such as “thank you” or “got it” were coded as MISC. A MISC was also used whenever a user simply provided their contact information such as their email address or telephone number. These instances occurred frequently in the data. There were also instances during coding where the thought unit was unintelligible. These thought units were labeled as Non-Codable (NC). Some of the NCs were assigned because a user utilized an unknown acronym. An example of this was a post where the user stated “WIE until UFN.” This thought unit may contain useful information, however, this was not apparent to the authors.

3. Individual Information Gathering

Table 9 shows the frequency of each Fiore et al. code assigned during the final coding session while excluding the MISC and NC codes. Excluding the MISC and NC codes in this table provides a better understanding of the use of the other codes. Individual Information Gathering (IIG) was the third most frequently assigned code. IIG was assigned whenever team members attempted to add to their existing knowledge. In a forum atmosphere this usually appears as a question asked by one team member to another. IIG was assigned to a thought unit an 8.6% percent of the time for the Security theme and 10.42% of the time for the Relief Logistics theme. The percentage usage of IIG were less than anticipated. The authors expected more questions to be raised by aid workers given the chaotic state of the relief efforts shortly after the disaster. The fewer than expected percentage use of IIGs might be explained by several reasons.

The first is that perhaps users did not post questions to APAN because they had found the answers to their questions by searching for the information that was already posted to the site by other users. Information posted by other users would have been labeled as TIE. If a user found an answer to their question by simply looking at the APAN site then they would have no need to post a question. A second reason for this disparity in the percentage used for this data compared with results from previous studies
on this topic is the fact that answering a question often involves more thought units than asking one. The percentages of TIEs assigned were increased by the length of the response to the questions posed since more information is exchanged in the response to a question. Despite the low percentage use of IIG, there were many instances where an individual seeking information prompted good discussions or alerted others of potential problems.

4. Team Solution Option Generation and Team Evaluation and Negotiation of Alternatives

Team Solution Option Generation (TSOG) appeared 2.28% of the time in the Security theme and 2.7% of the time in the Relief Logistics theme. Team Evaluation and Negotiation of Alternatives (TENA) was assigned for 2.43% of the data in the Security theme and 1.53% for the Relief Logistics theme. TSOG occurs as team members develop
solutions to the problems they are presented with. TENA occurs when users determine the suitability and effectiveness of various solutions. An example of these codes can be observed through one relief worker’s comments. The APAN user stated that the forum section of the site was a good place to coordinate planning as disaster relief efforts transitioned from search and rescue operations to Stability, Security, Transition and Reconstruction (SSTR) operations. This is an example of TSOG because the APAN user is presenting a potential solution to the problem of coordinating the transition between phases of the humanitarian assistance and disaster relief effort. The user added that the forum could also be used to notify other APAN users or relief workers of issues that needed to be dealt with. This thought unit was an example of TENA since the person is evaluating the potential option for its ability to solve the problem. These instances of TENA and TSOG show that APAN users utilized the site to present and discuss options.

5. **Team Knowledge Sharing**

There was a large disparity between the two coders over the use of Team Knowledge Sharing (TKS) and Team Information Exchange (TIE). In most instances where one coder assigned TKS, the other coder assigned TIE. This was true for both themes that were analyzed. This may be at least partially explained by the sometimes hazy line between stating information and interpreting information. TKS involves explanations and interpretations that are shared between team members, while TIE is simply information sharing with no interpretations. This may seem like a clear distinction but during coding it was sometimes difficult to discern between the two. An example of the hazy line between TKS and TIE can be found in one person’s post about the behavior of crowds during the distribution of relief supplies. The person stated that “this is an impressively controlled crowd” meaning that people were generally behaving themselves at the aid distribution centers. One coder assigned this thought unit a TKS code reasoning that the user made an interpretation of the situation on the ground. The other coder labeled this thought unit as TIE since the person seemed to only be making an observation. During final coding, the coders agreed upon TIE. Later, in the same person’s post he stated that Haitians “are trying to be well behaved so that aid will flow.” One coder coded this thought unit as TIE. The other coder coded it as TKS since the user
was interpreting the low instances of violence at the distribution centers as part of the larger effort to encourage the continued delivery of supplies. TKS was the final code assigned to this thought unit since the person was indeed making an interpretation of the facts. These examples show that it can be difficult sometimes to distinguish between TIE and TKS.

6. Team Process and Plan Regulation

There were only a few instances of Team Process and Plan Regulation (TPPR). TPPR occurs whenever a team member critiques the group’s knowledge building processes or plans. Many users did not offer a critique of the plan or process. Perhaps this was because there were few defined processes to criticize or evaluate during many operations in the early days of the disaster. Or perhaps many users did not feel comfortable criticizing plans or processes in a forum setting for everyone to see. An example of an instance where TPPR did occur was when a user commented on SOUTHCOM’s involvement in SSTR operations. This person noted that SOUTHCOM’s roles and responsibilities in SSTR operations should be defined along with the anticipated duration of the involvement. He went on to state that doing so would allow other organizations to plan accordingly. This person offered constructive criticism of the process to better coordinate planning efforts. However, the few instances of the use of this macrocognitive process in the data show that APAN was not the primary vehicle for these types of discussions. Perhaps users conducted these types of conversations through other means such as through telephone or email conversations.

7. Decision to Take Action

There were few instances of Decision to Take Action-Course of Action (DTA-COA). DTA-COA occurs when a superior directs a subordinate to perform a specified course of action. The low occurrence of DTA-COAs was not surprising given the horizontal relationship of the aid organizations operating in Haiti. No one organization was responsible for the entire relief effort. Thus, there were no observable instances of
senior to subordinate relationships between personnel using the site. Senior personnel may have indeed used the site to issue commands to subordinate personnel, but this relationship was not apparent in the data we analyzed.

There were, however, several instances of Decision to Take Action-Request to Take Action (DTA-RTA). DTA-RTA is assigned when a peer requests an action be taken by another peer. The authors observed several peer-to-peer interactions where one APAN user requested actions from another without having the authority to force that action. Most of the instances of DTA-RTA were largely formatting or procedural requests. For example, one post was a military message requesting all ships in the area to provide specific check-in information over the radio as they entered the harbor. That thought unit did not qualify as a DTA-COA since the message stated that providing that information was only voluntary as U.S. forces had no authority to enforce compliance.

C. ANALYSIS OF NATURALISTIC DECISION-MAKING CODES

The macrocognitive processes drawn from the Naturalistic Decision-Making (NDM) literature on sensemaking were assigned separately to the data. All thought units were first assigned a code according to the Fiore et al. model. If a thought unit also met the definition of one of the sensemaking macrocognitive process then it was assigned an NDM code in addition to the Fiore et al. model code. Table 10 provides a comparison of the percentage of codes assigned to the data using only the macrocognitive process definitions for sensemaking in the Security and Relief Logistics themes.

Table 10. Percentage of Communications Coded as Naturalistic Decision-Making (NDM) Codes

<table>
<thead>

</tr>
<tr>
<td>SM Sensemaking</td>
<td>1.53%</td>
<td>0.16%</td>
</tr>
</tbody>
</table>
The table shows that NDM codes were not applicable for most of the data. In these instances a NDM code was not appropriate and only a Fiore et al. code was assigned. Generally, when a NDM code was assigned it corresponded to a thought unit that was labeled with a TIE code in the Fiore et al. model. This shows the effectiveness of the NDM model in finding use of additional cognitive processes that are used by people who are collaborating to deal with a complex problem. This was crucial since a large percentage of exchanges were coded as TIE. Utilizing the NDM codes provided more insight into the cognitive processes used to respond to the Haiti humanitarian relief effort. NDM codes corresponded to other Fiore et al. codes but assignments relating to TIE were the most dominant.

1. Problem Detection and Anticipatory Thinking

The most frequently assigned NDM code was Problem Detection (PD). PD occurs whenever a member of the team alerts others to issues that need to be resolved. There were quite a few instances where users alerted others to problems that needed to be resolved such as orphanages that suffered from a lack of food or areas that needed more security. There was a large percentage of disagreement over the use of PD and Anticipatory Thinking (AT) by each coder.

AT is defined as the ability to foresee issues and make mental preparations. Coder 1 assigned the PD code to a thought segment 70% out of all NDM codes assigned while Coder 2’s percentage for PD was 55.8%. The percentage for AT was 13.61% for Coder 1 and 2.68% for Coder 2. The large differences between AT and PD coding assignments can be explained by the fact that there was initially a loose understanding of the definition separating the two codes. Both codes deal with recognizing issues. For example if someone says that not having a certain amount of supplies will probably be an issue later, then this might be construed as detecting a problem in which case a PD code would be appropriate. On the other hand this may also be taken as an anticipating a potential issue and thus merit an AT code. The confusion over the use of these codes explains the large differences in assignment.

After meeting to discuss the final coding assignments, the authors separated these two codes by noting that the PD code is for issues that arise now while the AT code are
for those issues that might arrive in the future. PD is assigned for issues that must be dealt with now. AT is used for issues that may be a problem but have yet to form and thus are not an imminent threat. Given the nature of the disaster relief operation in Haiti there were more instances of PD than AT. This reflected the fact that there were many problems that needed to be addressed immediately rather than in the future. Other studies of team collaboration, such as planning efforts, may have more examples of AT since planning efforts provide more time to consider potential issues.

Tables 11 and 12 provide examples of the use of the AT code. These tables show that the AT code corresponded to several Fiore et al. codes including TKS, TIE, TENA and IIG. Tables 13 and 14 provide examples of the PD code. A vast majority of PD codes corresponded to the TIE code. This shows the effectiveness of the PD code in breaking out more detailed team collaboration within the TIE code.

28. We have a medical team that came in on MFI [Missionary Flights International] but they didn’t have a confirmed return reservation for this Friday and now they can’t get on MFI because they’ve cut back from 3 flights a day to 2 and they have to get back to Florida.

29. But now we are told they aren’t flying everyday so that they could end up staying at the airport for several days.

30. After disaster local non-governmental agencies are the first to be cut off from the essential supply chain needed to serve their communities and the last to be reconnected.

31. An NGO needs to get a piece of spinal surgical equipment from Charleston, S.C. to Miami ASAP, for flight to PaP for surgery.

32. The border is open, but there is a group of boukaneyes that try to stop and harass people for money and ask for your passport.

33. They do not have authority.

34. So if they have no uniforms or identification they have no right to be collecting money from people.

35. Lifepoint Church in Smyrna, TN has 3,000 plus pounds of building supplies that needs to get to Port Au Prince.

36. A team is flying down to do work but they are having problems with transport for the supplies.

37. We did some analysis to try to help decision makers understand a few risks to the displaced person camps with the rainy season coming up.

38. As we enter the beginning of the rainy season in Haiti, one of the biggest problems facing relief organizations today is the spectre of flooding and mudslides destroying Internally Displaced Persons (IDP) Camps.

39. It has been reported that the Haitian Ministry of Economy and Finance has directed their customs personnel to require humanitarian organizations to sign over their supplies to the Haitian govt so they can screen them against illegal imports.

40. The U.S. embassy in PaP has not been responsive to my requests for specific customs protocol.

41. I’m very concerned that our medical/dental supplies and equipment could be detained.

42. I have heard several statements about having to turn over your relief aid to the Haitian government when it arrives.

2. Planning and Replanning

The Planning and Re-planning (PR) code was the third most frequently assigned NDM code. This code was used whenever users built a list of actions that were to be executed or when adjustments to previously developed plans were made. The PR code was generally assigned to a thought unit that followed or was also assigned a TSOG code. Generally, a user presented a potential solution to a problem and then proceeded to
describe a plan to implement that solution. Sometimes the presentation of a solution and a discussion of a plan occurred in the same thought unit. The relationship between TSOG and PR was demonstrated in the following example:

*It would seem to me that another way of getting these people out of the disaster area would be to take them by ship to a place to be screened, like GITMO, or someplace nearby, or to a U.S. port.*

In this thought unit, the user offered a potential solution to the problem of getting people out of the disaster area. The user then described the plan to handle this effort through the use of a ship or a port facility. Tables 15 and 16 show examples of PR.

Table 15. Examples from APAN data Security theme coded as Planning/Replanning.

<tr>
<td>15. We are exploring every private option including driving to MIA [Miami International Airport] for lift from there.</td>
<td>TSOG</td>
<td>PR</td>
</tr>
</tbody>
</table>

3. Sensemaking

Sensemaking (SM) is the process of framing and reframing inputs to the problem in order to help filter and interpret data. Tables 17 and 18 provide example of Sensemaking found in the Security and Relief Logistics themes respectively. Every SM code assigned in the data corresponded to the TKS code.

There were fewer instances of SM compared to other NDM codes because of the nature of the data. The Haiti earthquake required relief workers to provide a rapid
response on a host of issues. Users came up with short-term solutions to problems and moved on to other issues. There was little time spent revisiting the same issue. Additionally, most users were not concerned with long-term difficult problems, which are the kinds of issues that require the framing and reframing process captured in the SM code. Long-term problems, such as removal of the massive amounts of rubble and large-scale restoration of power and water, were problems that needed to be resolved by other organizations such as the IHRC. Other studies will likely capture more instances of SM as team members deal with larger and long-term problems.

Table 17. Examples from APAN data Security theme coded as Sensemaking.

<td>TKS</td>
<td>SM</td>
</tr>
</tbody>
</table>

4. Using Analogues

The Using Analogues (UA) code was assigned when a user compared the situations encountered in Haiti to a past experience. There were few instances of the UA code. This code was only assigned eight times by both coders. This low count may be a reflection of the devastation in Haiti. Some users simply may have never experienced a similar level of destruction. Or perhaps relief workers did not have much experience with earthquake related disasters despite having experience with other types of disasters. Finally users may have simply not have shared previous experiences because they were not applicable to the situation in Haiti.

One example of an instance where the UA code was assigned occurred in a post by an U.S. Air Force individual operating out of the Toussaint Louverture International Airport. He noted that during the relief efforts after Hurricane Katrina there was a problem of assigning too many slot times to aircraft. A slot time is a period of time that a plane has to take off from an airport. Assigning too many slot times can cause congestion at the airport. This user utilized his past experience to improve operations during the Haiti relief effort. Table 19 provides examples of the UA code taken from the data.

</tbody>
</table>
D. INTER-RATER RELIABILITY

Cohen’s kappa coefficient was used to determine inter-rater reliability and was applied to both sets of data for the cognitive processes included in the Fiore et al. model. The value of the Cohen’s kappa method for the data from the Security theme was .437 indicating a moderate amount of agreement between the two coders. The value of Cohen’s Kappa method for the Relief Logistics theme was higher than the Security theme at a value of .663. This value corresponds to a substantial amount of agreement between the two coders. An inter-rater reliability analysis of NDM codes was not conducted since there were substantially fewer NDM codes assigned than Fiore et al. codes.

Table 20. Table 20 provides a comparison of the coding assignments issued by each coder for the Security theme using only the Fiore et al. codes and the DTA codes. Table 21 provides the same data for the Relief Logistics theme. Table 22 and Table 23 provide coding comparisons of the NDM codes for the Security and Relief Logistics theme, respectively. A null code was assigned in instances where a NDM code was not used.

E. GENERAL OBSERVATIONS ABOUT THE DATA

There was a trend of relief workers using offline communications within the data. Offline communications involve instances where APAN users coordinated their efforts through other means than the APAN site. On numerous occasions users were directed to contact an individual directly via email or telephone. Information shared in this manner was not available on APAN. This was problematic since this approach to collaboration prevents other users from seeing the information exchanged to resolve the issue. A user may have viewed a discussion thread about a topic they were concerned with only to find that a solution to the issue raised was not available on APAN.

There were likely many more instances of offline communications that were not readily apparent in the data. Most users listed their contact information at the end of
every thread. This was generally followed by a comment suggesting that other users could contact them directly for information. It is not clear how many users collaborated via this means. If many users took this approach then that would mean that the entire conversation, including the question, would not be available on APAN. Any potential issues raised would not have been available for the group to see. In several instances it appeared that an APAN user did not get any response to their question. This is likely because a responding user contacted the first user directly using their contact information listed at the bottom of their post.

Of course not all communications need to be shared on the APAN site. Some issues may be so specific to the user that they may not be applicable to everyone else. However, at least the start of most of these conversations should be on APAN so other users can have insight and situational awareness of the current issues. An example of this was with the issue of adoptions. One APAN user stated that they were looking for information for a U.S. soldier who was trying to adopt a child of his deceased friend in Haiti. Another user responded by stating that adoptions to foreigners were closed in Haiti and that it may take some time for them to resume. The responding user asked additional clarifying questions about this specific soldier and recommended that the first user contact her via email.

This method of providing at least the start of the conversation on the collaboration site was useful. It alerted other users that adoptions in Haiti have been suspended and it let them know who to contact for more information. This interaction also provides a good example of when it is appropriate to conduct offline communications. Continuing the discussion off the APAN site was appropriate in this case since further conversations will likely focus on the specifics on that particular soldier’s case. Sharing this information over a public site such as APAN is a violation of privacy concerns. Thus, continuing the conversation off the site was beneficial.

Offline communications were also detrimental to our analysis of the data. Several conversations raised an issue but were resolved off of the APAN site preventing the
authors from observing the collaboration process that occurred to resolve the issue. Recognizing an issue is an important part of the collaboration process but so is determining the approach to solving the problem. Problem solving is at the heart of the team collaboration process and in several cases that process was not observed. There may have been more instances of TSOG, TENA, DTA-RTA and other codes present in the data if these conversations were captured. Offline communications also prevented the authors from having a clearer picture of the events that occurred during the relief efforts. It was difficult in some instances to assign a proper code without the proper background discussion.

Reaching a level of common understanding can be difficult in situations where different groups operate together for the first time. One example of this is with acronyms. Some APAN users utilized acronyms that other users were unfamiliar with. This can certainly be a problem when military and civilians operate together given the preponderance of acronym use in the military. Sometimes even seemingly common terms were ambiguous to the uninformed. Non-Governmental Organizations (NGOs) is a term used to refer to all aid organizations that are not affiliated with a government. It is a common term used in the U.S. government but apparently not one that is universally used among aid organizations. One APAN user did not understand the acronym NGO. The user asked “who/what is the NGO?” and “what is their contact info.” The user also asked “are they already on the ground in Haiti?” This user observed a discussion about NGOs and assumed the acronym referred to a single organization instead of a general term applied to a certain type of group. This kind of confusion regarding terminology certainly increased the complexity of coordination among aid workers.
V. CONCLUSIONS

A. BENEFITS OF THIS STUDY

This study has demonstrated the applicability of the CKI program’s model of team collaboration to one example of inter-organizational collaboration under real-world conditions. Utilizing data from APAN provided an excellent opportunity to observe inter-organizational collaboration during a disaster response. Aid workers during the crisis were forced to come together to deal with a host of issues. The Haitian government’s ability to respond to the earthquake was severely limited due to the loss of so many of their government buildings and personnel. The United Nations mission in Haiti was also devastated since their headquarters was destroyed in the disaster. The loss of these entities created a situation where aid workers needed to work together to de-conflict efforts and exchange information. The motivation to share information and resources was strong because of necessity. The disaster created a chaotic situation for relief personnel to work through. This situation provided an ample of amount of data to study in order to validate the model.

The high percentage use of Team Information Exchange (TIE) indicates the APAN site was primarily used for the exchange of information. Information exchange was important given the chaotic nature of the situation and the fact that so many different organizations were involved in the relief operation. However, several additional processes were used which indicates the relative use of macrocognitive processes by aid workers during the Haiti relief effort. We have observed that there were few senior to subordinate relationships among the aid workers since there were few Decision To Take Action-Course of Action (DTA-COA) codes utilized. Instead decisions to act came in the form of requests between peers. The model has also shown that aid workers in Haiti were primarily concerned with dealing with immediate issues rather than long-term issues as indicated by the large amount of Problem Detection (PD) codes compared to Sensemaking (SM) or Anticipatory Thinking (AT) codes. These examples show that the models were effective in analyzing team collaboration during the disaster.
B. COMMENTS ABOUT THE APAN SITE

APAN provided a means for a disparate group of organizations to come together to exchange information and coordinate their efforts. The fact that so many different groups participated in the discussions on the site is one example of the site’s usefulness. Sometimes even the seemingly insurmountable was achieved on APAN. For example, one user stated there was a need for a Computerized Axial Tomography (CAT) scan machine in Haiti to help diagnose patients. These machines are very expensive; one user noted that one model sells for about $44,000. The user posted the need for the equipment and soon another user responded by stating that there was a doctor in Miami who wanted to donate a CT scanner to the relief effort for free. The site was even used to coordinate the actual delivery of the scanner. If the APAN site was not available then these two users may have had a harder time determining each other’s needs and the availability of relief supplies. Getting the word out was one of the most effective parts of APAN. Alerting users to current and potential issues was crucial to the operation.

APAN was not perfect, despite it’s success. It is important to note the site’s shortfalls. One user, who was critical of the APAN site, stated that security on the site was very strict particularly with passwords. Passwords on the site needed to be very long which made them hard to remember. Access concerns are an important issue. If a site requires too much security then people will not use it. In the case of Haiti there were not many other collaboration sites available but that will not always be the case in other disasters. Spreading collaboration efforts throughout multiple sites would not be ideal since doing so would make it more difficult to find information. Too much security could prevent users from registering and using the site. If the registration procedures for the site are too long or cumbersome then users may simply give up. Of course, a degree of security is important, as users need to feel their questions are being responded to by reputable sources and not by someone simply claiming to be an official. Inaccurate information can be extremely costly in a disaster response environment. Striking a proper balance between security and openness will be a key to the future use of APAN.

Getting past concerns about over-militarization of relief work is another issue. Civilians may not always trust the U.S. military. This is particularly true with aid
workers from foreign countries. The site should be portrayed as a partnership with the NGO community instead of as an operation run solely by the U.S. government. If users feel they are part of the process they will make the site better by adding more information and offering constructive criticism.

This site should remain user friendly and simple to use. It should not require extensive training. Keeping the site easy to use will encourage use among non-technologically savvy individuals. Individuals may be reluctant to share information on the site if the site is too complicated. If the site is too difficult to use then the talents of many innovative people may be lost. There are plenty of intelligent people out there who may not have the technical experience to overcome the learning barrier required to utilize the site.

The issue of offline communications, where users communicate through other means besides the site, is likely to continue. Many users simply feel more confident about asking questions or dealing with issues directly with another person. This is particularly true if the issue they are concerned with is an important one. Many users do not want to post an issue to a site that may linger in obscurity. Most people prefer a direct response through email or phone calls where they feel more confident they can get an answer even if the answer is “I do not know.” Site administrators should encourage users to at a minimum start conversations on APAN so that other users know who to contact to obtain more information.

C. RECOMMENDED FURTHER STUDIES

It should be remembered that a model is not reality, but is only an abbreviated representation of reality (Science Education Resource Center at Carleton College, 2011). George E. P. Box once said, “All models are wrong but some are useful” (as cited in Science Education Resource Center at Carleton College, 2011). Validation of any given model may then be viewed as a process that incrementally increases the accuracy and, hence, the usefulness of the model. Bearing in mind that reality is infinitely more
complex than any model, the model will never duplicate reality. However, the model may eventually reach a point at which further validation will not produce an appreciable increase in accuracy for a given level of effort.

The empirical model of team collaboration is not likely at this point of diminishing returns. As such, further validation efforts are warranted. The March 2011 Japan earthquake, like the 2010 Haiti earthquake, was the subject of a global relief effort and APAN was used again to coordinate relief efforts. This presents another opportunity to further validate the model.

Team collaboration during exercise planning may also yield relevant data. The team collaboration efforts during this study were largely devoted to dealing with immediate issues. The nature of disaster relief operations requires an immediate response to issues in order to save as many lives as possible. Planning efforts do not have the same time constraints. Planning for future events allow teams to coordinate efforts without having to deal with immediate issues. This should allow further examination of macrocognitive processes, which are part of the Fiore et al. model, for which we did not see ample evidence in this study. These include AT, TSOG and TENA. Expansion of the study domain into planning efforts would also yield valuable data on naturalistic decision making, as described in the Klein NDM model in previous chapters.

Another study could also focus on team collaboration efforts within a hierarchical command structure. This type of study will provide a better analysis of the macrocognitive processes occurring in the team environment in which a course of action could be directed by a superior, signified by the DTA-COA code. The horizontal nature of the Haiti relief effort prevented the observation of DTA-COAs because there were few observable instances of a senior to subordinate relationship. Additionally, few actual decisions were made on APAN. Most of the conversations on APAN revolved around alerting others to issues or determining the availability of resources. An examination of a hierarchical command structure would allow for a broader range of macrocognitive processes.

Collaboration efforts within other task domains should also be studied to further validate the model. Disaster response efforts provide one opportunity to examine team
members while under stress and likely while sleep deprived. Disaster relief efforts also
bring a wide range of different groups together. This was certainly true during disaster
relief efforts in Haiti where a number of different organizations from different nations
operated together. These types of high tempo operations allow for a detailed examination
of team collaboration under difficult situations and with unfamiliar individuals.

Evaluating the model, using tools other than APAN, may reveal different aspects
of team collaboration. APAN was useful for introducing a problem and introduction of
team members, but relief workers evidenced few solution options and evaluation of those
options as indicated by the relatively low instances of TENA and TSOG codes. Often,
APAN recorded team collaboration on a specific issue up to the point of the exchange of
personal contact information. After this, the remainder of team collaboration on this
problem was not recorded on APAN. Presumably, team collaboration continued via
radio, telephone calls and emails until the problem was resolved to the satisfaction of the
people involved. This lack of evidence of use of TSOG and TENA may be less the fault
of APAN and more the inclination of the relief workers. They may have preferred direct
interaction, such as via telephone calls. Relief workers may have wanted to hear the
person’s voice or felt that a verbal exchange was more dynamic than entering a solution
and getting a response via keyboarding. Examination of other collaboration tools may
capture the entire collaborative process, including resolution of the issue, that APAN did
not capture.

Future studies should hold longer practice coding sessions. Our study contained
two practice coding sessions with two sets of codes of about two hundred thought units.
As noted previously, most codes were assigned a TIE code and, likewise, most of the
codes from this practice session were TIE codes. Longer practice coding sessions will
provide more extensive practice and thought units that exhibit other codes. The largest
disagreements between the two coders occurred with the rarely used codes. Longer
practice coding sessions should alleviate this problem since more examples will be
present. Also, practice coding sessions should include thought units from samples of the
same data the thesis is utilizing. One of the practice coding sessions utilized for this
study was based on thought units from a previous thesis on team collaboration during the
terrorist attacks on September 11, 2001. This practice session was beneficial, but it did not provide a common understanding of the data. The second practice coding session proved more useful, since it was based on APAN data. This session provided an opportunity to examine the way the data was structured.

A question that arose in the course of this study pertained to the correlation between the level of stress in a scenario and the quality and effectiveness of team collaboration. If the level of stress rises, does the quality of team collaboration rise with it, or does it diminish? Does this relationship between stress and collaboration quality remain constant, or does it change at different levels of stress. Does this vary with the level of expertise of the team members? It may be conjectured that there is a level of stress at which communication breaks down and any further stress in the scenario all but makes team collaboration impossible. Further research, which would include self-reported measures of stress levels and performance measures, determining the veracity of this conjecture may be valuable to the study of team collaboration.

The Cohen’s kappa statistical analysis of the Fiore et al. model codes was a useful mechanism of determining inter-rater reliability. However, such a reliability mechanism for the NDM model codes was lacking, due to the low amount of NDM codes present in the data. Other studies may yield more instances of NDM codes. Though technically a statistical area of research, this would doubtless prove useful in rating the reliability of multiple individuals assigning NDM codes to team collaboration data.

<td>---Original Message--- From: “Name” [MAILTO:”Email”] sent Monday, January 18, 2010 5:52 am to: “Email” subject: Security over the course of the next few days (beginning as we speak) the security situation will likely get worse before it gets better. For the group at large some, some questions we are interested in getting answered are: 1. What is the security situation in the various sectors of PAP? Outside of PAP? 2. Is there evidence of organized gang violence? if so where is the most specific the better? 3. What are the disposition of composition of the various gangs in the PAP area? Who are leaders? What are the estimated strengths? 4. What are the various sectors of illicit activity occurring in Haiti that are impacting the HA/DFR efforts? 5. Is there evidence of violence at the various border crossing into Dom Rep? What about illicit activity? 6. Where have organized gangs habitually operated in Haiti? disposition of composition -- view this message online at <a href="http://community.action.org/public_info/11715166/0/788776.aspx?r=6">http://community.action.org/public_info/11715166/0/788776.aspx?r=6</a> if reply to this message Capture this message to a web classification unclassified”</td>

| 1-19-2010-6-21 | STAR TIDES National Defense University | P3 and Global Hawk imagery requests | 130 | I also have the capability to deliver relief support for up to 40,000 Haitians. TIE TSOG TIE  
So SOUTHCOM is aware, currently coverage available to the NGO community is as follows: TIE TIE TIE  
Wiki.openstreetmap.org/wiki/Haiti_high_resolution_imagery_ac_of_2010-01-19.png | TIE PD TIE PD TIE PD |
| 1-19-2010-6-31 | Telecommunications Rapid Response Consulting | P3 and Global Hawk imagery requests | 138 | Strongly concur. TIE TIE TIE  
These image requests are critical if we need to establish community communications and data networking in any remote camps, back to Port-au-Prince or other localized access to the internet, such as VSAT. TIE TIE TIE | TIE PD TIE PD TIE PD |
| 1-19-2010-6-54 | Telecommunications Rapid Response Consulting | Security | 141 | I don’t have an SFCN address. TIE TIE TIE | TIE PD TIE PD TIE PD |
| 1-19-2010-6-19 | Telecommunications Rapid Response Consulting | Security | 142 | But this intel is going to be important for planning and logistics issues on a variety of fronts, such as installation and running communications solutions throughout Haiti. TIE TIE TIE | TIE PD TIE PD TIE PD |
| 1-19-2010-9-13 | Water and Wastewater Engineers | Evacuating foreign nationals out of Haiti | 144 | I am a civil engineer up here in Alaska, and have been following the events and needs of the Haitian disaster. TIE TIE TIE  
I read an article in the ARPA newsletter (police newsletter) linking to Miami Herald article about hundreds of empty seats left on flights out of Port-Air port, with people unable to utilize them. TIE TIE TIE | TIE PD TIE PD TIE PD |
| 1-19-2010-9-13 | Telecommunications Rapid Response Consulting | Security | 145 | The issue of pre flight screening is a legitimate one. TIE TIE TIE  
Due to the opportunistic approaches of terrorists attacking our aircraft. TIE TIE TIE  
It would seem to me that another way of getting these people out of the disaster area would be to take them by ship to a place to be secured. TIE TIE TIE | TIE PD TIE PD TIE PD |
| 1-19-2010-9-13 | Telecommunications Rapid Response Consulting | Security | 146 | I am not sure yet, or to a US port. TIE TIE TIE  
As main thing is to get them off the island and out of the way of the relief effort, but to still maintain security. TIE TIE TIE  
Just my two cents. TIE TIE TIE | TIE PD TIE PD TIE PD |
<p>| 1-19-2010-9-13 | Telecommunications Rapid Response Consulting | Security | 150 | Here in Alaska, we do not deal in large populations, but we do deal in serious long distances logistics in the aviation and maritime environments in harsh conditions. * TIE TIE TIE | TIE PD TIE PD TIE PD |
| 1-21-2010-6-27 | \ | \ | 154 | You can provide more information? TIE TIE TIE | TIE PD TIE PD TIE PD |</p>

<td>Original Message:---- From: &quot;Name&quot; [MAILTO: &quot;Email&quot;] sent Monday, January 18, 2010 5:52 am To: &quot;Email&quot; Subject: Security over the course of the next few days, beginning as we speak, the security situation will likely get worse before it gets better. For the group at large, some questions we are interested in getting answered are: 1. What is the security situation in the various sectors of PAP? Outside of PAP? 2. is there evidence of organized gang violence? If so, where is the most specific (the better)? 3. What are the disposition/composition of the various groups in the PAP area? Who are leaders? what are the estimated strengths? 4. What are the various sectors of illicit activity occurring in Haiti that are impeding the HA/DR efforts? 5. is there evidence of violence at the various border crossing into Dom Rep? What about illicit activity? 6. Where have organized gangs habitually operated in Haiti? Disposition/composition -- view this message online at <a href="http://community.apar.org/plush/ha119/01g780/00976.aspx/00976">http://community.apar.org/plush/ha119/01g780/00976.aspx/00976</a> or reply to this message Capture this message to a wide -- classification unclassified*</td>

*Flying out of pop airport*

1163 I have no personal experience with the following post but it is worth checking into. | TIE | TIE | TIE |

Report: Per the CRG in Haiti - All AMCU’s/American Relief Workers, DoD, NGO, military (everyone except DVA and personnel on emergency leave) requiring requesting air travel from Haiti to CONUS, go to the PAX terminal at the airport in Haiti. | DTA | TIE | DTA |

DNS and personal on emergency leave go to the ATOD Command post area at the east end of the ramp. | DTA | TIE | DTA |

They have flights leaving approx every 3 hours to Charleston, Maudlin, Orlando, Homestead, Miami, and other CONUS locations. | TIE | TIE | TIE |
