Award Number: W81XWH-08-2-0180

TITLE: Mortuary Affairs Soldiers: Early Intervention and Altering barriers to Care for Traumatic Stress and PTSD

PRINCIPAL INVESTIGATOR: Carol S. Fullerton, Ph.D.

CONTRACTING ORGANIZATION: The Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc. Rockville, MD 20852

REPORT DATE: September 2011

TYPE OF REPORT: Annual

PREPARED FOR: U.S. Army Medical Research and Materiel Command Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for Public Release; Distribution Unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.
This project was designed to implement and assess the feasibility of a unique and newly-developed intervention (TEAM: Troop Education for Army Morale: Units and Individuals Working Together). TEAM is designed to meet the specific post deployment needs of Mortuary Affairs (MA) Soldiers through individual training, active engagement in problem solving and accessing care, enhanced buddy care and spouse support. Short and longer-term outcome in MA Soldiers are assessed. Specific aims include: 1) demonstrating the feasibility of TEAM intervention for care, support and lessening barriers to care for MA Soldiers and 2) assessing the effectiveness of TEAM on disorder (e.g., PTSD, depression), distress, health risk behaviors (e.g., alcohol or tobacco use), work function, marital conflict, and barriers to health care utilization. Five cohorts (total of 89 Soldiers) have been recruited from the 54th and 111th MA companies at Ft Lee, VA. Subject recruitment continues. Collected data has been entered into the database. Data cleaning and preparations for data analysis are ongoing.

INTRODUCTION

This project was designed to implement and assess the feasibility of a unique and newly developed intervention (TEAM: Troop Education for Army Morale: Units and Individuals Working Together). TEAM is designed to meet the specific post deployment needs of Mortuary Affairs (MA) Soldiers for early and follow-up intervention to speed recovery, return to work and limit barriers to care through individual training, active engagement in problem solving and accessing care, enhanced buddy care and spouse support. Short and longer-term outcome in MA Soldiers are assessed. Specific aims include: 1) demonstrating the feasibility of TEAM intervention for care, support and lessening barriers to care for MA Soldiers and 2) assessing the effectiveness of TEAM on disorder (e.g., PTSD, depression), distress, health risk behaviors (e.g., alcohol or tobacco use), work function, marital conflict, and barriers to health care utilization. MA Soldiers are recruited from the 54th and 111th MA companies at Ft Lee, VA. We will recruit the maximum number of available post-deployment MA Soldiers. Approximately 54 MA Soldiers will become available to recruit every six months (study approved for up to 420 total subjects). We expect approximately 44 Soldiers to enroll every 6 months with approximately half randomly assigned to the TEAM intervention and half to the non-intervention comparison group. We estimate approximately N=200 (100 from each group) will complete the training and assessments. Spouses of Soldiers in the intervention group are eligible to participate in spouse workshops. We estimate 7-8 spouses in each cohort will agree to participate. TEAM has two levels of intervention: Module I. Group Training; Module II: Social Context Building. The Module I intervention will be given shortly after return from deployment (approximately 1 month). Module II will be given at 3 months and assessments will be at 1, 2, 3, 6 and 9 months. This two-pronged approach focuses on individual education while altering the social context. Each Module has an evidence informed educational/training component and a stepped care component providing education and outreach as well as resources and interactive multimodal support.

BODY

Below is a summary of the major activities undertaken by the project team during the last year organized by the timeline in the Statement of Work (SOW).

1. Coordination planning with site/units. Members of the project remain in frequent contact with the Fort Lee Command and Mortuary Affairs units to maintain support for TEAM and plan for ongoing recruitment and intervention workshops. Institutional regulatory review has been obtained and maintained from the Uniformed Services University and Fort Detrick IRBs. Study clinicians and staff have completed and updated human subjects training.
2. **Personnel recruitment, hiring and training.** The project is fully staffed and members of the project have been trained on the use of the intervention materials (e.g., intervention manual, slides, handouts) as well as means of delivering the educational content (e.g., conducting workshops, use of the phone line and email service, participant safeguards).

3. **Development of short and long-term intervention and assessment.** Assessments (evaluations) have been developed for all assessment periods for intervention and control groups. Prior to finalization, assessments were reviewed by a project consultant for utility and ease of understanding. Intervention materials for Soldiers in the intervention group and participating spouses have been developed. Materials include a detailed intervention training manual for trainers, Power Point slides, handouts and a dedicated website. The intervention’s educational content includes skills for care of self and others (buddy/spouse) and whenever possible is targeted to the special needs of MA Soldiers or spouses. The educational content (e.g., presentation material, handouts) is based on Psychological First Aid and addresses barriers to seeking care, managing resistance and accessing care. The website supports the workshop educational content and allows for viewing copies of workshop slides and handouts. A TEAM email address and a toll free 1-866 telephone line have been established for purposes of educational support of Soldiers in the intervention group and participating spouses.

4. **Develop participant tracking system.** A data base structure for data entry and organization of recruitment and tracking has been built.

5. **Feasibility study and recruitment coordination.** Assessment and intervention materials (e.g., intervention manual, handouts) were reviewed by a consultant prior to finalization. Pilot testing of all aspects of TEAM materials, procedures and logistics is complete. Fort Lee Command and Mortuary Affairs units support the TEAM program and are cooperative in arranging availability of subjects and space for conducting workshops at Fort Lee.

6. **Intervention and assessments, ongoing data preparation.** Recruitment of the first cohort of subjects (N=21; 11 in intervention group, 10 in control group) began in July 2009 and their final assessment was completed in June 2010. TEAM intervention materials, assessments, procedures and logistics were evaluated and optimized throughout cohort 1. Cohort 2 (N=31; 16 intervention, 15 control) was recruited in December 2009 and completed their final survey in September 2010. Cohort 3 (N=23; 12 intervention, 11 control) was recruited in June 2010 and completed their final survey in January 2011. Cohort 4 (N=11; 6 intervention, 5 control) was recruited in November 2010.
and are expected to complete their final survey within the next month. Cohort 5 (N=3: 2 intervention, 1 control) was recruited in May 2011 and has received the first two workshops. Spouse participation has been lower than anticipated. To date, 89 Soldiers and 1 spouse have participated in TEAM. Assessment data collected to date have been entered into the subject-tracking database.

7. **Complete subject recruitment, intervention and assessment.** Subject recruitment is ongoing at this time.

8. **Data preparation.** Data collection continues at this time. Preparation of the existing data for statistical analysis including inputting data into the SPSS database, cleaning data and assessing data quality is in progress.

9. **Preparation for project conference.** To be completed.

10. **Data analysis.** Frequency counts have been conducted as part of data cleaning. Frequency counts of initial responses to questions regarding probable PTSD and probable depression as well as the helpfulness of the TEAM program were totaled. Results of these preliminary analyses were used in poster presentations (see Appendices A-K).

11. **Final project conference.** To be completed.

12. **Preparation and delivery/distribution of final report.** To be completed.

**KEY RESEARCH ACCOMPLISHMENTS**

- Development and finalization of a multimodal educational intervention program for Soldiers returning from deployment and their spouses.

- Development of a supportive relationship with Fort Lee Command and Mortuary Affairs units for recruitment of subjects and delivery of the TEAM program.

- Recruitment of five cohorts (N=89 Soldiers) to date.

- Development of a database for tracking subjects and statistical analysis.
REPORTABLE OUTCOMES

Eleven posters based on the TEAM study have been presented at professional meetings (see Appendices A-K for abstracts and mini-posters).

Canada, November 2010.

CONCLUSION

The study is in the recruitment, data collection, and intervention phase. Five cohorts have been recruited thus far. Data collected to date has been entered into the project database. All aspects of this project are progressing as planned.

Abstract

Populations exposed to traumatic events (e.g., war, disaster, terrorism) are at increased risk for posttraumatic distress and adjustment difficulties. It is critical for health care professionals and others who work with trauma-exposed populations to know and apply the current standard of early trauma care. A new educational intervention program based on evidence informed principles of Psychological First Aid (PFA) and Cognitive Behavioral Therapy (CBT) has been developed to address specific post-trauma needs. PFA is designed to reduce the initial distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping through five key principles: 1) physical and psychological safety, 2) calming, 3) connectedness, 4) self-efficacy and 5) hope/optimism. CBT is an approach to altering the thoughts and beliefs that lead to negative emotions and has been shown to prevent and treat posttraumatic stress disorder when administered early after trauma exposure. The intervention program involves individual skills training, active engagement in problem solving, exploring barriers to healthcare utilization and building and integrating resources within the home (e.g., spouse support) and occupational environment (e.g., coworker support). Spouses and coworkers can be offered an equivalent intervention program to improve their ability to understand and support the needs of the trauma-exposed individual as well as to meet their own specific needs for support. Participants are trained to 1) develop self-care skills and healthy cognitions, 2) recognize when someone needs care, 3) provide early support to foster rapid recovery and adjustment and 4) recognize barriers to care and promote health care utilization when needed. The intervention is delivered through group workshops, handouts, a website and toll-free phone information line. The impact of this new educational intervention program is being assessed with a group of high risk U.S. Army Mortuary Soldiers upon their return from deployment.
EARLY CARE FOR PSYCHOLOGICAL TRAUMA: INNOVATIONS IN TEACHING AND DELIVERY
Quinn M. Biggs, Ph.D., M.P.H., Carol S. Fullerton, Ph.D., Dave Benedek, M.D.,
James McCarroll, Ph.D., M.P.H., John H. Newby, Ph.D., M.S.W., Robert J. Ursano, M.D.
Center for the Study of Traumatic Stress, Department of Psychiatry, Uniformed Services University of the Health Sciences, Bethesda, MD

BACKGROUND
Exposure to traumatic events such as war, terrorism, natural disasters, motor vehicle collisions and assault can cause considerable psychological distress, psychiatric disorders, impaired functioning and an increase in health risk behaviors (e.g., use of alcohol or tobacco). For example, rates of posttraumatic stress disorder (PTSD), depression and alcohol misuse were as high as 19%, 13% and 30%, respectively, in Soldiers returning from Iraq and Afghanistan. Similarly, rates of PTSD and depression were 22% and 13%, respectively, in disaster workers 13 months after responding to an airplane crash. The burden of disease caused by traumatic events can interfere with an individual’s ability to function in the work and home environment and affect the family. Often, individuals exposed to trauma do not seek help for their problems.

METHODS OF DELIVERY
Methods of Delivery
- Stepped collaborative care model
- Concierge-type service (be available when help is wanted)
- Didactic group workshops
- Educational handouts
- Referral resources
- Spouse and buddy support

NEW EDUCATIONAL INTERVENTION
A New Educational Intervention Program
Primary Objective: Help trauma exposed individuals increase coping in the initial weeks and months after a traumatic event
Specific Aims: Speed recovery, decrease time to return to work, and limit barriers to healthcare utilization
Components: Education and individual skills training, active engagement in problem solving and accessing healthcare, and tailoring needs and resources

The intervention builds individual self-care skills and skills for supporting others within the individual’s unique social context. The program integrates resources within the home and work environment to enhance the natural role of spouse and buddy support. Spouses and buddies are offered an equivalent intervention program including all workshops, resources and self-care and support components. The intervention is unique in that it is based on the evidence informed principles of Psychological First Aid (PFA) and Cognitive Behavioral Therapy (CBT). The intervention is education-based and NOT mental or physical health treatment.

EVIDENCE INFORMED PRINCIPLES
Psychological First Aid
PFA is designed to reduce the initial distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping by ensuring the following five principles:
- Safety
- Calming
- Connectedness
- Self/Collective Efficacy
- Hope and Optimism

Cognitive-Behavioral Therapy
CBT is an approach to altering thoughts and beliefs that lead to negative emotions. It has been shown to successfully treat PTSD when administered early after trauma exposure.

TRAINING GOALS
Training Goals
The intervention focuses on the education and training of trauma exposed individuals and their spouses and buddies to:
- Increase adaptive coping in response to symptoms of stress
- Identify when an individual is in need of care
- Develop individual self-care skills and healthy cognitions
- Improve communication skills and build supportive relationships
- Provide early support to foster rapid recovery
- Address health risk behaviors (e.g., alcohol, tobacco)
- Promote health care seeking when needed
- Overcome barriers to healthcare utilization

Currently, this intervention is being offered to U.S. Army Mortuary Affairs soldiers and their spouses at Fort Lee, VA. Shortly after return from deployment to Iraq and Afghanistan, Soldiers attend an introduction to the intervention. Workshops 1, 2 and 3 follow at 30, 60 and 90 days from return from deployment and the booster takes place at 6 months. Outcomes including rates of posttraumatic distress and disorders, impaired functioning and healthcare utilization are assessed throughout the study.

SUMMARY
- Exposure to traumatic events increases the risk of psychological distress, psychiatric disorders and health risk behaviors
- A new educational intervention uses evidence informed principles of psychological first aid and cognitive-behavioral therapy as well as a stepped care model of support and a concierge-type service to address recovery from traumatic events
- The intervention enhances the natural role of spouse and buddy support and addresses barriers to healthcare utilization
- Interventions of this type are critical need due to the high number of soldiers returning from Iraq and Afghanistan with psychiatric disorders and the low rate of utilizing needed mental healthcare
- Principles of the educational intervention are relevant to all branches of the military, disaster workers, first responders and others exposed to high demand and risky environments

Abstract

U.S. Army Mortuary Affairs Soldiers (MA) returning from Iraq and Afghanistan report high rates of posttraumatic stress disorder (PTSD), psychological distress, personal and family stress, functional impairment and needing but not obtaining health care. A new educational intervention, TEAM (Troop Education for Army Morale), is designed to reduce distress and foster adaptive functioning. TEAM is based on evidence informed principles of Psychological First Aid (safety, calming, connectedness, self-efficacy, hope/optimism) delivered through workshops, handouts, a website and phone line. Soldiers and their spouses learn to use self-care skills, recognize when soldiers need care, provide support (buddy care, spouse support), identify barriers to care and promote health care utilization when needed. MA Soldiers, randomized to TEAM or no intervention, complete questionnaires upon return from deployment and at 1, 2, 3, 6, and 9 months. Significant reductions in arousal, distress and functional impairment as well as increases in healthcare utilization are anticipated. Data are not yet available. Findings will increase our knowledge of PFA based early intervention and PTSD symptomology. Implications include the feasibility of early intervention with all military service members, first responders, disaster workers and others exposed to the dead.
EARLY INTERVENTION FOR POSTTRAUMATIC STRESS DISORDER IN MORTUARY AFFAIRS SOLDIERS
Quinn M. Biggs, Ph.D., M.P.H., Carol S. Fullerton, Ph.D., James Mccarroll, Ph.D., M.P.H.,
Dave Benedek, M.D., John H. Newby, Ph.D., M.S.W., Robert J. Ursano, M.D.
Center for the Study of Traumatic Stress, Department of Psychiatry, Uniformed Services University of the Health Sciences, Bethesda, MD

BACKGROUND
U.S. Army Mortuary Affairs Soldiers (MA) returning from Iraq and Afghanistan report high rates of probable posttraumatic stress disorder (PTSD), psychological distress, personal and family stress, functional impairment and needing but not obtaining health care.

- 19.9% Probable PTSD
- 71.6% Moderate to high stress
- 57.6% Spouse or significant other experiencing moderate to high stress
- 24.6% Seven or more bad mental health days in the past month
- 27.7% In need of medical care but did not obtain help

METHODS OF DELIVERY

Methods of Delivery
- Stepped collaborative care model (increase care as needed)
- Informational website (training materials, resources)
- Didactic group workshops
- Educational handouts
- Referral resources
- Toll-free telephone information line
- Support through spouse and buddy

Workshop 1
Stress Reactions
Safety

Workshop 2
Calming
Connectedness
Hope/Optimism

Workshop 3
Self-Efficacy
Hope/Optimism

Booster Review of all prior topics

Training Timeline: Shortly after return from deployment, Soldiers attend an introduction to the intervention. Workshops 1, 2 and 3 follow at 30, 60 and 90 days from return from deployment and the booster takes place at 6 months. Outcomes including rates of posttraumatic distress and disorders, impaired functioning and healthcare utilization are assessed throughout the intervention.

TRAINING GOALS

Training Goals: TEAM focuses on the education and training of Soldiers and their spouses to:
- Increase adaptive coping in response to symptoms of stress
- Identify when an individual is in need of care
- Develop individual self-care skills and healthy cognitions
- Improve communication skills and build supportive relationships
- Provide early support to foster rapid recovery
- Address health risk behaviors (e.g., use of alcohol or tobacco)
- Promote health care seeking when needed
- Overcome barriers to healthcare utilization

EVIDENCE INFORMED PRINCIPLES

Basis of the Intervention: TEAM is based on the evidence informed principles of Psychological First Aid (PFA) 1-3 and Cognitive Behavioral Therapy (CBT) 4. TEAM is education-based and NOT mental or physical health treatment.

Psychological First Aid: PFA is designed to reduce the initial distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping by ensuring the following five principles:
- Safety
- Calming
- Connectedness
- Self/Collective Efficacy
- Hope and Optimism

Cognitive-Behavioral Therapy: CBT is an approach to altering thoughts and beliefs that lead to negative emotions. It has been shown to successfully treat and prevent PTSD when administered early after trauma exposure.

Principles of PFA

Self- and Collective Efficacy

Safety (Physical and Psychological)

Connectedness (Giving and Receiving Support)

Hope and Optimism

Thoughts and beliefs about an event

Emotional response (+/- mood)

SUMMARY

- Mortuary Affairs Soldiers returning from deployment have high rates risk of psychological distress and adjustment difficulties
- TEAM, a new educational intervention uses evidence informed principles of PFA and CBT therapy as well as a stepped care model of support and a concierge-type service to address recovery and adaptation
- The intervention enhances the natural role of spouse and buddy support and addresses barriers to healthcare utilization
- Interventions of this type are in critical need due to the high number of soldiers returning from Iraq and Afghanistan with psychiatric disorders and the low utilization rate of needed mental healthcare 5
- Findings will increase our knowledge of PFA based early intervention and PTSD symptomology
- Principles of the TEAM intervention are relevant to other branches of the military, first responders, disaster workers and others exposed to the dead

BACKGROUND
Exposure to traumatic events such as war, terrorism, natural disasters, motor vehicle collisions and assault can cause considerable psychological distress, psychiatric disorders, impaired functioning and an increase in health risk behaviors (e.g., use of alcohol or tobacco). For example, rates of posttraumatic stress disorder (PTSD), depression and alcohol misuse were as high as 19%, 13% and 30%, respectively, in Soldiers returning from Iraq and Afghanistan.

Similarly, rates of PTSD and depression were 22% and 13%, respectively, in disaster workers 13 months after responding to an airplane crash. The burden of disease caused by traumatic events can interfere with an individual’s ability to function in the work and home environment and affect the family. Often, individuals exposed to trauma do not seek help for their problems.

METHODS OF DELIVERY

A New Educational Intervention Program

**Primary Objective:** Help trauma exposed individuals increase coping in the initial weeks and months after a traumatic event

**Specific Aims:** Speed recovery, decrease time to return to work, and limit barriers to healthcare utilization

**Components:** Education and individual skills training, active engagement in problem solving and accessing healthcare, and tailoring needs and resources

The intervention builds individual self-care skills and supports for supporting others within the individual’s unique social contest. The program integrates resources within the home and work environment to enhance the natural role of spouse and coworker support. Spouses and coworkers are offered an equivalent intervention program including all workshops, resources and self-care and support components. The intervention is unique in that it is based on the evidence informed principles of Psychological First Aid (PFA)3 and Cognitive Behavioral Therapy (CBT). The intervention is education-based and NOT mental or physical health treatment.

NEW EDUCATIONAL INTERVENTION

**Methods of Delivery**

- Stepped collaborative care model (increase care as needed)
- Concierge-type service (be available when help is wanted)
- Didactic group workshops
- Educational handouts
- Address specific concerns in workshops via index cards

**Methods of Delivery**

- Informational website (training materials, resources)
- Toll-free telephone information line
- Email service
- Referral resources
- Spouse and coworker support

**Workshop 1**

**Stress Reactions**

- Safety
- Connectedness
- Hope/Optimism

**Workshop 2**

**Calming**

- Connectedness (Giving and Receiving Support)
- Safety (Physical and Psychological)

**Workshop 3**

**Self-Efficacy**

- Calming (Arousal Reduction)
- Emotional response (+/- mood)

**Booster**

- Review of all prior topics

**Training Goals**

The intervention focuses on the education and training of trauma exposed individuals and their spouses and coworkers to:

- Increase adaptive coping in response to symptoms of stress
- Identify when an individual is in need of care
- Develop individual self-care skills and healthy cognitions
- Improve communication skills and build supportive relationships
- Provide early support to foster rapid recovery
- Address health risk behaviors (e.g., use of alcohol or tobacco)
- Promote health care seeking when needed
- Overcome barriers to healthcare utilization

The intervention will be piloted with U.S. Army Mortuary Affairs soldiers at Fort Lee, VA and their spouses. Shortly after return from deployment, soldiers attend an introduction and are randomized to workshop or usual services (control) groups. Workshops 1, 2 and 3 follow at 30, 60 and 90 days and the booster at 180 days. Questionnaire assessments will be conducted at 30, 60, 90, 180 and 270 days. Workshop and usual service groups will be compared on outcomes including rates of posttraumatic distress and disorders, impaired functioning, healthcare utilization and utilization of program services (e.g., website, email, telephone info line).

**Evidence Informed Principles**

**Psychological First Aid**

PFA is designed to reduce the initial distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping by ensuring the following five principles:

- Safety
- Calming
- Connectedness
- Self/Collective Efficacy
- Hope and Optimism

**Cognitive-Behavioral Therapy**

CBT is an approach to altering thoughts and beliefs that lead to negative emotions. It has been shown to successfully treat PTSD when administered early after trauma exposure.

**Principles of PFA**

- Safety
- Calming
- Connectedness
- Self/Collective Efficacy
- Hope and Optimism

Abstract

Background and Objectives: U.S. Army Mortuary Affairs Soldiers (MA) returning from Iraq and Afghanistan have substantial rates of Posttraumatic Stress Disorder (PTSD), depression, psychological distress and health risk behaviors (e.g., alcohol or tobacco use). Exposure to death and combat increases the risk for posttraumatic distress and adjustment difficulties. After deployment, MA Soldiers report high rates of personal and family stress, functional impairment and needing but not obtaining health care. Support from family, co-workers and supervisors has been found to be beneficial in the weeks and months post-deployment. A newly developed educational intervention, TEAM (Troop Education for Army Morale), is designed to address specific post-deployment needs of MA soldiers. TEAM involves individual skills training, active engagement in problem solving, exploring barriers to healthcare utilization and building and integrating resources within the unit (e.g., buddy care) and home (e.g., spouse support). TEAM is based on the evidence informed principles of Psychological First Aid (PFA) and Cognitive Behavioral Therapy (CBT). PFA is designed to reduce the initial distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping through key principles: 1) physical and psychological safety, 2) calming, 3) connectedness, 4) self-efficacy and 5) hope/optimism. CBT is an approach to altering the thoughts and beliefs that lead to negative emotions and can prevent and treat PTSD when administered early after trauma exposure. Spouses of soldiers participating in TEAM are offered an equivalent intervention tailored to the specific needs of spouses. Soldiers and spouses are trained to 1) develop self-care skills and healthy cognitions, 2) recognize when a soldier needs care, 3) provide early support to foster rapid recovery and adjustment and 4) recognize barriers to care and promote health care utilization when needed. The intervention is delivered through group workshops, handouts, a website and toll-free phone information line.

Methods: TEAM is a longitudinal, randomized controlled trial. MA Soldiers are recruited from the 54th and 111th MA companies at Ft Lee, VA (estimated N=480) within 2 weeks of return from deployment. Questionnaire assessments are conducted at 1, 2, 3, 6, and
9 months post deployment. TEAM participants are compared to MA soldiers not receiving the TEAM intervention. Study goals include demonstrating the feasibility of TEAM for care and support of MA soldiers. Primary outcomes include assessing psychiatric disorder (e.g., PTSD, depression), psychological distress, health risk behaviors, quality of life, work function, marital conflict and barriers to health care utilization.

**Results/Conclusions:** Not yet available.

**Impact Statement:** This study has implications for development, assessment and feasibility of early intervention with MA soldiers post-deployment. Our findings will increase our knowledge of resilience and the contribution of soldier education and the environment (i.e., spouse and buddy care) to recovery and adjustment post-deployment. Our study has broader implications for intervention with first responders and other disaster workers exposed to the dead. Findings from this study and principles of the TEAM intervention are relevant to all branches of the military and the community that must sustain first responders in high stress environments including deployments and disasters.
U.S. Army Mortuary Affairs Soldiers (MA) returning from Iraq and Afghanistan have substantial rates of posttraumatic stress disorder (PTSD), depression, psychological distress, and health risk behaviors (e.g., alcohol or tobacco use). Exposure to death and combat increases the risk for posttraumatic distress and adjustment difficulties. After deployment, MA Soldiers report high rates of personal and family stress, functional impairment and need but not obtaining health care. Support from family, co-workers and supervisors has been found to be beneficial after deployment.

NEW EDUCATIONAL INTERVENTION

TEAM (Troop Education for Army Morale): TEAM is a new educational intervention program to help MA Soldiers and their spouses and families reduce distress and foster adaptive coping in the initial weeks and months after deployment. TEAM is designed to speed recovery, decrease time to return to work and limit barriers to healthcare utilization. TEAM components include:

- Building individual self-care skills and skills for supporting others
- Integrating resources within the social context of home and unit to enhance the natural role of spouse and buddy support
- Education and skills training, active problem solving, engagement in accessing healthcare, and tailoring needs and resources
- Offering spouses an equivalent intervention including all workshops, resources and self-care and support components

Methods and Assessment: TEAM is currently being offered to MA Soldiers (estimated N=480) and their spouses at Fort Lee, VA. MA Soldiers, randomized to the TEAM intervention or no intervention, complete questionnaires upon return from deployment and at 1, 2, 3, 6, and 9 months. Primary outcomes include assessing psychiatric disorder (e.g., PTSD, depression), psychological distress, health risk behaviors, quality of life, work function, marital conflict and barriers to healthcare utilization. Participants’ use of the TEAM program’s resources (e.g., website, phone line) are also assessed. Spouses are not assessed.

Evaluation of the TEAM program: Outcomes for Soldiers in the intervention group are compared to the non-intervention group. Study goals include demonstrating the feasibility of TEAM for care and support of MA Soldiers. Significant reductions in arousal, distress and functional impairment as well as increases in healthcare utilization are anticipated. Data are not yet available.

EVIDENCE INFORMED PRINCIPLES

Basis of the Intervention: TEAM is based on the evidence informed principles of Psychological First Aid (PFA)1-3 and Cognitive Behavioral Therapy (CBT)4. TEAM is education-based and NOT mental or physical health treatment.

Psychological First Aid: PFA is designed to reduce the initial distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping by ensuring the following five principles:

- Safety
- Calming
- Connectedness
- Self/Collective Efficacy
- Hope and Optimism

Cognitive-Behavioral Therapy: CBT is an approach to altering thoughts and beliefs that lead to negative emotions. It has been shown to successfully treat and prevent PTSD when administered early after trauma exposure.

Principles of PFA

Safety (Physical and Psychological)

Connectedness (Giving and Receiving Support)

Hope and Optimism

Calming (Arousal Reduction)

Self- and Collective Efficacy

Thoughts and beliefs about an event

Emotional response (+/— mood)

SUMMARY AND IMPACT

Mortuary Affairs Soldiers returning from deployment have high rates risk of psychological distress and adjustment difficulties

TEAM, a new educational intervention, uses evidence informed principles of PFA and CBT therapy as well as a stepped care model of support and a concierge-type service to address recovery and adaptation

The intervention enhances the natural role of spouse and buddy support and addresses barriers to healthcare utilization

Interventions of this type are in critical need due to the high number of soldiers returning from Iraq and Afghanistan with psychiatric disorders and the low utilization rate of needed mental health care

Findings will increase our knowledge of PFA-based early intervention and PTSD symptomology

Principles of the TEAM intervention are relevant to other branches of the military, first responders, disaster workers and others exposed to the dead

** We wish to acknowledge additional members of our Intervention Team: LCDR Patcho Santiago, M.D., M.P.H., Christine Gray, M.P.H., Stephanie M. Riley, B.S., and Natalie T. Kostyl, M.A.

Abstract

U.S. Army Mortuary Affairs Soldiers (MA) returning from Iraq and Afghanistan report high rates of posttraumatic stress disorder (PTSD), psychological distress, personal and family stress, functional impairment and needing but not obtaining health care. A new educational intervention, TEAM (Troop Education for Army Morale), is designed to reduce distress and foster adaptive functioning. TEAM is based on evidence informed principles of Psychological First Aid (safety, calming, connectedness, self-efficacy, hope/optimism) delivered through workshops, handouts, a website and phone line. Soldiers and their spouses learn to use self-care skills, recognize when soldiers need care, provide support (buddy care, spouse support), identify barriers to care and promote health care utilization when needed. MA Soldiers, randomized to TEAM or no intervention, complete questionnaires upon return from deployment and at 1, 2, 3, 6, and 9 months. We present preliminary data on the impact of TEAM to specific PTSD criteria, work function and health care utilization. Significant reductions in arousal, distress and functional impairment are anticipated. Findings will increase our knowledge of PFA based early intervention and PTSD symptomology. Implications include the feasibility of early intervention with all military service members, first responders, disaster workers and others exposed to the dead.
**BACKGROUND**

U.S. Army Mortuary Affairs Soldiers (MA) returning from Iraq and Afghanistan have substantial rates of posttraumatic stress disorder (PTSD), depression, psychological distress, and health risk behaviors (e.g., alcohol or tobacco use). Exposure to death and combat increases the risk for posttraumatic distress and adjustment difficulties. After deployment, MA Soldiers report high rates of personal and family stress, functional impairment and needing but not obtaining health care. Support from family, co-workers and supervisors has been found to be beneficial after deployment.

**NEW EDUCATIONAL INTERVENTION**

TEAM (Troop Education for Army Morale): TEAM is a new education and skills training intervention to help MA Soldiers and their spouses and families reduce distress and foster adaptive coping in the initial weeks and months after deployment. TEAM training includes building skills for self-care and support of others (e.g., buddy care), active problem solving, engagement in accessing healthcare, and tailoring needs and resources. TEAM integrates resources in the social context of home and unit to enhance the natural role of spouse and buddy support (i.e., spouses are offered an equivalent intervention and all training support).

Methods and Assessment: TEAM is currently being offered to MA Soldiers (estimated N=480) and their spouses at Fort Lee, VA. MA Soldiers, randomized to the TEAM intervention or no intervention, complete questionnaires upon return from deployment and at 1, 2, 3, 6, and 9 months. Primary outcomes include assessing psychiatric disorder (e.g., PTSD, depression), psychological distress, health risk behaviors, quality of life, work function, marital conflict and barriers to healthcare utilization. Participants’ use of the TEAM program’s resources (e.g., website, phone line) are also assessed. Spouses are not assessed.

Goals: The training of Soldiers and spouses to:
- Develop self-care skills and healthy cognitions
- Increase adaptive coping in response to stress
- Identify when an individual is in need of care
- Provide early support to foster rapid recovery

**EVIDENCE INFORMED PRINCIPLES**

Basis of the Intervention: TEAM is based on the evidence informed principles of Psychological First Aid (PFA)\(^1\)-\(^3\) and Cognitive Behavioral Therapy (CBT). TEAM is education-based and NOT mental or physical health treatment.

- Psychological First Aid:
  - PFA is designed to reduce the initial distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping by ensuring the following five principles:
    - Safety
    - Calming
    - Connectedness
    - Self/Collective Efficacy
    - Hope and Optimism

- Cognitive-Behavioral Therapy: CBT is an approach to altering thoughts and beliefs that lead to negative emotions. It has been shown to successfully treat and prevent PTSD when administered early after trauma exposure.

**METHODS**

Methods of Delivery:
- Stepped collaborative care model\(^6\) (increase care as needed)
- Concierge-type service (be available when help is wanted)
- Didactic group workshops
- Educational handouts
- Informational website (training materials, resources)
- Toll-free phone information line and email service
- Referral resources
- Support through spouse and buddy

BACKGROUND
U.S. Army Mortuary Affairs Soldiers (MA) returning from Iraq and Afghanistan have substantial rates of posttraumatic stress disorder (PTSD), depression, psychological distress, and health risk behaviors (e.g., alcohol or tobacco use). Exposure to death and combat increases the risk for posttraumatic distress and adjustment difficulties. After deployment, MA Soldiers report high rates of personal and family stress, functional impairment and needing but not obtaining health care. Support from family, co-workers and supervisors has been found to be beneficial after deployment.

NEW EDUCATIONAL INTERVENTION
TEAM (Troop Education for Army Morale): TEAM is a new education and skills training intervention to help MA Soldiers and their spouses and families reduce distress and foster adaptive coping in the initial weeks and months after deployment. TEAM training includes building skills for self-care and support of others (e.g., buddy care), active problem solving, engagement in accessing healthcare, and tailoring needs and resources. TEAM integrates resources in the social context of home and unit to enhance the natural role of spouse and buddy support (i.e., spouses are offered an equivalent intervention and all training support).

Methods and Assessment: TEAM is currently being offered to MA Soldiers (estimated N=480) and their spouses at Fort Lee, VA. MA Soldiers, randomized to the TEAM intervention or no intervention, complete questionnaires upon return from deployment and at 1, 2, 3, 6, and 9 months. Primary outcomes include assessing psychiatric disorder (e.g., PTSD, depression), psychological distress, health risk behaviors, quality of life, work function, marital conflict and barriers to healthcare utilization. Participants’ use of the TEAM program’s resources (e.g., website, phone line) are also assessed. Spouses are not assessed.

Goals: The training of Soldiers and spouses to:
- Develop self-care skills and healthy cognitions
- Increase adaptive coping in response to stress
- Identify when an individual is in need of care
- Provide early support to foster rapid recovery
- Build supportive relationships
- Improve communication skills
- Promote health care seeking when needed
- Overcome barriers to healthcare utilization
- Address health risk behaviors (e.g., alcohol use)

EVIDENCE INFORMED PRINCIPLES
Basis of the Intervention: TEAM is based on the evidence informed principles of Psychological First Aid (PFA)3 and Cognitive Behavioral Therapy (CBT).3 TEAM is education-based and NOT mental or physical health treatment.

Psychological First Aid: PFA is designed to reduce the initial distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping by ensuring the following five principles:
- Safety
- Calming
- Connectedness
- Self/Collective Efficacy
- Hope and Optimism

Cognitive-Behavioral Therapy: CBT is an approach to altering thoughts and beliefs that lead to negative emotions. It has been shown to successfully treat and prevent PTSD when administered early after trauma exposure.

Principles of PFA
- Safety (Physical and Psychological)
- Connectedness (Giving and Receiving Support)
- Calming (Arousal Reduction)
- Hope and Optimism
- Self- and Collective-Efficacy

Four principles of the TEAM intervention are relevant to other branches of the military, first responders, disaster workers and others exposed to the dead:
- Mortuary Affairs Soldiers returning from deployment have high rates of psychological distress and adjustment difficulties
- TEAM, a new educational intervention, uses evidence informed principles of PFA and CBT therapy as well as a stepped care model of support and a concierge-type service to address recovery and post-deployment adaptation
- The intervention enhances the natural role of spouse and buddy support and addresses barriers to healthcare utilization
- Interventions of this type are in critical need due to the high number of soldiers returning from Iraq and Afghanistan with psychiatric disorders and the low utilization rate of needed mental health care4

SUMMARY AND IMPACT
- Findings will increase our knowledge of PFA-based early intervention and PTSD symptomology
- Principles of the TEAM intervention are relevant to other branches of the military, first responders, disaster workers and others exposed to the dead

METHODS AND TIMELINE

PRELIMINARY RESULTS
Assessments: All Soldiers reported that “Overall, the TEAM training was helpful” (N=11). Talking with others (fellow Soldiers), learning about stress and coping, relaxation training, and the educational handouts were among the most helpful components.

How much has the TEAM training helped you in:

- recognizing problems re-adjusting post-deployment: 46%
- talking with people about concerns and problems: 73%
- feeling safe: 64%
- using relaxation techniques: 55%
- connecting with others: 46%

Observations: Soldiers show interest in participating in TEAM (e.g., a Soldier came in to participate in TEAM during his leave; another requested to continue in TEAM after her separation from the Army). Anecdotal feedback has been positive (i.e., “The [calming exercise] helped me and my family by reducing my anger”). Command at Fort Lee has been very supportive of TEAM.

BACKGROUND

U.S. Army Mortuary Affairs Soldiers (MA) recover, identify, and evacuate the remains of deceased military personnel and their personal effects from Iraq and Afghanistan. Exposure to death and the combat environment increases the risk for posttraumatic distress and adjustment difficulties.

NEW EDUCATIONAL INTERVENTION

TEAM (Troop Education for Army Morale): TEAM is a new education and skills training intervention to help MA Soldiers and their spouses reduce distress and foster adaptive coping in the months after deployment. TEAM integrates resources in the social context of home and unit to enhance the natural role of spouse and buddy support. Spouses are offered an equivalent intervention.

Basis of the Intervention: TEAM training is based on the evidence-informed principles of Psychological First Aid (PFA)1 and Cognitive Behavioral Therapy (CBT)2.

Psychological First Aid: PFA is designed to reduce the distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping through the principles of Safety, Calming, Connecting, Self-Efficacy, and Hope/Optimism.

Cognitive-Behavioral Therapy: CBT is an approach to altering thoughts and beliefs that lead to emotions. It has been shown to treat posttraumatic distress and adjustment difficulties.

Delivery of Intervention:

• Interactive group workshops
• Educational handouts
• Toll-free phone line and email service
• Website (resources, training materials)

Goals: The training of Soldiers to:

• Develop self-care skills and increase adaptive coping in response to stress
• Identify when an individual is in need of care
• Provide early support and foster rapid recovery
• Build supportive relationships
• Improve communication skills
• Promote health care seeking when needed
• Overcome barriers to health care utilization
• Address health risk behaviors (e.g., alcohol use)

Procedures: MA Soldiers at Fort Lee were randomized to TEAM intervention (Workshop) or no intervention (Usual Services). Workshops held 1, 2, 3, and 6 mos. post deployment. Questionnaires completed at return from deployment and 1, 2, 3, 6, and 9 mos. Outcomes: psychiatric disorder (PTSD, depression), psychological distress, functional impairment, impact of TEAM on post deployment readjustment.

Participants: 75 MA Soldiers (Workshop Group N=39; Usual Services N=36)

• Gender: 73.1% male; 26.9% female
• Age: range 19-50 years (M=28.58)
• Education: 1.5% HS; 43.3% HS/GED; 50.7% some college; 4.5% bachelors
• Rank: 16.4% Private or Private First Class; 65.7% Specialist or Corporal; 17.9% Sergeant (all enlisted)
• Race: 63.6% White; 16.7% Black; 12.1% Hispanic; 4.5% American Indian or Alaskan Native; 3.0% Asian or Pacific Islander
• Marital Status: 68.7% married; years M=76; 73.3% live with their spouse

Measures:

• Probable PTSD: PTSD Checklist (PCL-17): “How much you have been bothered by each problem in the past month” (1=not at all to 5=extremely). Probable PTSD if total symptom score ≥50 (range 17-85) and 3 intrusion, 3 avoidance, 2 hyperarousal symptoms scored moderately or higher.

• Probable Depression: Patient Health Questionnaire (PHQ-9): Positive if 5 or more of 9 symptoms present “more than half the days” or “most days” in the past 2 weeks and at least 1 symptom is depressed mood or anhedonia.

METHODS

Probable PTSD (N=47) Probable Depression (N=46)

PTSD and Depression (1 month post deployment)

0% 10% 20% 30% 40% 0% 10% 20% 30% 40%

PTSD Depression

Probable PTSD (N=47) 31.9% n=15

Probable Depression (N=46) 26.1% n=12

Work-Related Impairment (reported at least half of the time, 1 mo. post deploy.; N=28)

• 70.2% Felt fatigued
• 53.2% Lost concentration

Helpfulness of TEAM: (2-9 mos. post deployment; N=28)

• Having a positive outlook
• Providing support to a buddy
• Problem solving
• Connecting with others
• Communicating with others
• Relaxation techniques
• Feeling safe
• Asking for or seeking care
• Taking care of self and managing stress
• Talking about concerns and problems
• Readjusting to family and garrison life

RESULTS

0% 20% 40% 60% 80% 100%

Limitations

• Preliminary data (2 cohorts completed, 1 in progress, 2 more cohorts expected)
• Self-selection to study and attendance at workshops
• Self-report measures

SUMMARY AND IMPACT

• These preliminary data suggest Mortuary Affairs Soldiers returning from Iraq and Afghanistan have high rates of PTSD and depression.
• Most participants described TEAM as being “Moderately” or “Quite a bit” helpful.
• TEAM enhances the natural role of spouse and buddy support and addresses barriers to health care utilization.
• Interventions of this type are needed due to the high number of Soldiers returning from deployment with PTSD and low rates of mental health care utilization6.
• Soldiers returning from deployment report benefit from Psychological First Aid-53.2% Lost concentration and prevent PTSD successfully when administered early after trauma exposure.

• 70.2% Felt fatigued
• 53.2% Lost concentration

Abstract

U.S. Army Mortuary Affairs Soldiers (MA) returning from Iraq and Afghanistan report high rates of posttraumatic stress disorder (PTSD), psychological distress, personal and family stress, functional impairment and needing but not obtaining health care. A new educational intervention, TEAM (Troop Education for Army Morale), is designed to reduce distress and foster adaptive functioning. TEAM is based on evidence informed principles of Psychological First Aid (PFA; safety, calming, connectedness, self-efficacy, hope/optimism) delivered through workshops, handouts, a website and phone line. Soldiers learn to use self-care skills, recognize when Soldiers need care, provide support (buddy care, spouse support), identify barriers to care and promote health care utilization when needed. MA Soldiers, randomized to TEAM or no intervention, complete questionnaires upon return from deployment and at 1, 2, 3, 6, and 9 months. Preliminary results with the first three cohorts show probable PTSD and probable depression are 31.9% and 26.1%, respectively, at one month post deployment. Work-related impairments, including working more slowly than usual, lost concentration, and fatigue, are high. On average, the TEAM program was rated as helpful in important post deployment coping areas such as recognizing problems and seeking help (social support, healthcare utilization), connecting and communicating with others, feeling safe, and using calming techniques to reduce arousal. These findings increase our knowledge of PFA based early interventions. Implications include the feasibility of early intervention with all military service members, first responders, disaster workers and others exposed to the dead.
TROOP EDUCATION FOR ARMY MORALE (TEAM) POST DEPLOYMENT EARLY EDUCATION PROGRAM
FOR MORTUARY AFFAIRS SOLDIERS; RESULTS FROM THE FIRST YEAR

Newby, Ph.D., M.S.W., Stephanie N. Riley, B.S., Chad A. Spiegel, M.A., Natalie T. Kody, M.A., and Robert J. Ursano, M.D.

Center for the Study of Traumatic Stress, Department of Psychiatry, Uniformed Services University of the Health Sciences, Bethesda, MD

BACKGROUND

U.S. Army Mortuary Affairs Soldiers (MA) recover, identify, and evacuate the remains of deceased military personnel and their personal effects from Iraq and Afghanistan. Exposure to death and the combat environment increases the risk for posttraumatic distress and adjustment difficulties.

NEW EDUCATIONAL INTERVENTION

TEAM (Troop Education for Army Morale): TEAM is a new education and skills training intervention to help MA Soldiers and their spouses reduce distress and foster adaptive coping in the months after deployment. TEAM integrates resources in the social context of home and unit to enhance the natural role of spouse and buddy support. Spouses are offered an equivalent intervention.

Basis of the Intervention: TEAM training is based on the evidence-informed principles of Psychological First Aid (PFA) and Cognitive Behavioral Therapy (CBT).

Psychological First Aid: PFA is designed to reduce the distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping through the principles of Safety, Calming, Connecting, Self-Efficacy, and Hope/Optimism.

Cognitive-Behavioral Therapy: CBT is an approach to altering thoughts and beliefs that lead to emotions. It has been shown to treat and prevent PTSD successfully when administered early after trauma exposure. However, TEAM is education-based and NOT therapy or mental health treatment.

Procedures: MA Soldiers at Fort Lee, Virginia were randomized to receive either the TEAM intervention (Workshop) or no intervention (Usual Services). Workshops were held at 1, 2, 3, 6 months post deployment. Questionnaires were completed at return from deployment and 1, 2, 3, 6, 9 months. Outcomes included psychiatric disorder (PTSD, depression), psychological distress, functional impairment, and impact of TEAM on post deployment readjustment.

Participants: 75 MA Soldiers (Workshop Group N=39; Usual Services N=36)

• Gender: 73.1% male; 26.9% female
• Age: range 19-50 years (M=28.58)
• Education: 1.5% HS; 43.3% HS/GED; 50.7% some college; 4.5% bachelors
• Race: 63.6% White; 16.7% Black; 12.1% Hispanic; 4.5% American Indian or Alaskan Native; 3.0% Asian or Pacific Islander
• Marital Status: 68.7% married; years M=4.76; 73.3% live with their spouse

Measures:

• Probable PTSD: PTSD Checklist (PCL-17): “How much you have been bothered by each problem in the past month” (1=not at all to 5=extremely). Probable PTSD if total symptom score >50 (range 17-85) and 1 intrusion, 2 avoidance, 2 hyperarousal symptoms scored moderately or higher.

• Probable Depression: Patient Health Questionnaire (PHQ-9): Positive if 5 or more of 9 symptoms present “more than half the days” or “most days” in the past 2 weeks and at least 1 symptom is depressed mood or anhedonia.

REFERENCES:

SUMMARY AND IMPACT

These preliminary data suggest Mortuary Affairs Soldiers returning from Iraq and Afghanistan have high rates of PTSD and depression.

Soldiers returning from deployment report benefit from Psychological First Aid and Cognitive Behavioral Therapy-based early educational intervention.

Most participants described TEAM as being “Moderately” or “Quite a bit” helpful.

TEAM enhances the natural role of spouse and buddy support and addresses barriers to health care utilization.

Interventions of this type are needed due to the high number of Soldiers returning from deployment with psychiatric disorders and low mental health care utilization.

Findings have implications for use of this intervention with Soldiers in other military branches, first responders, disaster workers and others exposed to the dead.

LIMITATIONS

• Self-selection to study and attendance
• Self-report measures
• Preliminary data (2 cohorts completed, 1 in progress, 2 more cohorts expected)

Abstract

U.S. Army Mortuary Affairs Soldiers (MA) returning from Iraq and Afghanistan report high rates of posttraumatic stress disorder (PTSD), psychological distress, personal and family stress, functional impairment and needing but not obtaining health care. A new educational intervention, TEAM (Troop Education for Army Morale), is designed to reduce distress and foster adaptive functioning. TEAM is based on evidence informed principles of Psychological First Aid (PFA; safety, calming, connectedness, self-efficacy, hope/optimism) delivered through workshops, handouts, a website and phone line. Soldiers learn to use self-care skills, recognize when Soldiers need care, provide support (buddy care, spouse support), identify barriers to care and promote health care utilization when needed. MA Soldiers, randomized to TEAM or no intervention, complete questionnaires upon return from deployment and at 1, 2, 3, 6, and 9 months. Preliminary results with the first three cohorts show probable PTSD and probable depression are 31.9% and 26.1%, respectively, at one month post deployment. Work-related impairments, including working more slowly than usual, lost concentration, and fatigue, are high. On average, the TEAM program was rated as helpful in important post deployment coping areas such as recognizing problems and seeking help (social support, healthcare utilization), connecting and communicating with others, feeling safe, and using calming techniques to reduce arousal. These findings increase our knowledge of PFA based early interventions. Implications include the feasibility of early intervention with all military service members, first responders, disaster workers and others exposed to the dead.
**PRELIMINARY RESULTS (CONT.)**

**BACKGROUND**

U.S. Army Mortuary Affairs Soldiers (MA) recover, identify, and evacuate the remains of deceased military personnel and their personal effects from Iraq and Afghanistan. Exposure to death and the combat environment increases the risk for posttraumatic distress and adjustment difficulties.

**METHODS**

**Basis of the Intervention:** TEAM training is based on the evidence-informed principles of Psychological First Aid (PFA)\(^1-^3\) and Cognitive Behavioral Therapy (CBT).\(^4\)

**Psychological First Aid:**

PFA is designed to reduce the distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping through the principles of Safety, Calming, Connecting, Self-Efficacy, and Hope/Optimism.

**Cognitive-Behavioral Therapy:**

CBT is an approach to altering thoughts and beliefs that lead to emotions. It has been shown to treat and prevent PTSD successfully when administered early after trauma exposure. However, TEAM is education-based and NOT therapy or mental health treatment.

**Delivery of Intervention:**

- Interactive group workshops
- Educational handouts
- Toll-free phone line and email service
- Website (resources, training materials)
- Support through spouse and buddy
- Referral resources
- Conscience-type service
- Stepped collaborative care model\(^5\)
- Support through spouse and buddy
- Improve communication skills
- Promote health care seeking when needed
- Develop self-care skills and increase adaptive coping in response to stress
- Identify when an individual is in need of care
- Provide early support to foster rapid recovery
- Build supportive relationships
- Address health risk behaviors (e.g., alcohol use)

**Goals:** The training of Soldiers to:

- Develop self-care skills and increase adaptive coping in response to stress
- Identify when an individual is in need of care
- Provide early support to foster rapid recovery
- Build supportive relationships
- Improve communication skills
- Promote health care seeking when needed
- Overcome barriers to health care utilization
- Address health risk behaviors (e.g., alcohol use)

**Participants:**

- MA Soldiers at Fort Lee, Virginia were randomized to receive either the TEAM intervention (Workshop) or no intervention (Usual Services). Workshops were held at 1, 2, 3, 6, & 9 months post deployment. Questionnaires were completed at return from deployment and 1, 2, 3, 6, & 9 months. Outcomes included psychiatric disorder (PTSD, depression), psychological distress, functional impairment, and impact of TEAM on post deployment readjustment.

**Methods:**

- **Participants:** 75 MA Soldiers (Workshop Group N=39; Usual Services N=36)
- **Gender:** 73.1% male; 26.9% female
- **Age:** range 19-50 years (M=28.58)
- **Education:** 1.5% <HS; 43.3% HS/GED; 50.7% some college; 4.5% bachelors
- **Rank:** Private or Private First Class; 65.7% Specialist or Corporal; Sergeant (all enlisted)
- **Marital Status:** 68.7% married; years M=4.76; 73.3% live with their spouse
- **Race:** 63.6% White; 16.7% Black; 12.1% Hispanic; 4.5% American Indian or Native American; 0.7% Asian or Pacific Islander
- **Problem solving:** 35.7
- **Relaxation techniques:** 32.1
- **Relaxation techniques:** 10.7
- **Problem solving:** 14.3
- **Relaxation techniques:** 7.1
- **Problem solving:** 7.1
- **Relaxation techniques:** 7.1
- **Problem solving:** 14.3
- **Relaxation techniques:** 17.9
- **Taking care of self and managing stress:** 25.0
- **Limitations:**
  - Self-selection to study and attendance
  - Self-report measures
  - Preliminary data (2 cohorts completed, 1 in progress, 2 more cohorts expected)

**Procedures:**

- MA Soldiers at Fort Lee, Virginia were randomized to receive either the TEAM intervention (Workshop) or no intervention (Usual Services). Workshops were held at 1, 2, 3, 6, & 9 months post deployment. Questionnaires were completed at return from deployment and 1, 2, 3, 6, & 9 months. Abstract

Statement of the Problem

The development of interventions for returning soldiers and their families is critical to the mental and behavioral health of soldiers returning from deployments to Iraq and Afghanistan. Mortuary Affairs (MA) soldiers in the U.S. Army perform duties involving recovery, identification and evacuation of the dead are at increased risk for development of distress, disorder and health risk behaviors such as increased use of alcohol and tobacco. Studies suggest that regardless of profession, training, or past experience, duties involving recovery and identification of human remains are associated with acute and long-term psychological distress and psychiatric disorders. Mortuary Affairs soldiers report high rates of probable posttraumatic stress disorder (PTSD), psychological distress, personal and family stress, functional impairment. They report needing health care but not obtaining needed care, suggesting the importance of better understanding barriers to health care utilization. To our knowledge, there are no post-deployment interventions designed specifically for MA soldiers, spouses and buddies. We report preliminary findings of a randomized controlled intervention study using the principles of Psychological First Aid as an intervention in the first 9 months post-deployment in Mortuary Affairs Soldiers.

Subjects

Mortuary Soldiers are recruited into the study within a month of return from deployment to Iraq or Afghanistan. Participation is voluntary and IRB-approved Informed Consent is obtained from all participants. Participants are enlisted US Army personnel. Thus far, 86 soldiers have been recruited into the study across 4 cohorts. Study participants are 70.9% male, 29.1% female, age 19-50 years old (M=28.58). They are 63.6% White; 16.7% Black; 12.1% Hispanic; 4.5% Native American; 3.0% Asian. The majority (68.7%) are married; the mean number of years married is 4.76.

Procedures
This longitudinal, controlled intervention study randomizes MA soldiers into intervention and control groups within a month of return from deployment. All study participants complete questionnaires at 1, 2, 3, 6, and 9 months that include questions about deployment experiences, mental health including PTSD (PCL-17) and depression (PHQ-9), health care utilization, barriers to care, social support, health risk behaviors, and evaluation of aspects of the intervention. The intervention, TEAM (Troop Education for Army Morale), is based on evidence-informed principles of Psychological First Aid (safety, calming, connectedness, self-efficacy, and hope/optimism), and is delivered through workshops conducted at 1, 2, 3, and 6 months post-deployment, as well as handouts, a website and phone line. Spouses of intervention-group soldiers are also provided the opportunity to attend separate workshops with similar educational content. Both soldiers and their spouses are taught to use self-care skills, recognize when soldiers need care, provide support (buddy care, spouse support), identify barriers to care and promote health care utilization when needed.

Results

Preliminary results from the first 4 cohorts will be presented. Data to date indicate rates of probable PTSD and probable depression to be 31.9% and 26.1%, respectively, in soldiers one month post-deployment. Among participants, 14.9% reported obtaining medical care for emotional or family problems, and 34.0% felt in need of medical care but did not obtain any. Of the participants, 28.9% reported that they drank more alcohol than usual or re-started after quitting, 22.2% consume 5 or more alcohol drinks at one time, and 40.5% increased tobacco use or re-started after quitting. Longitudinal data on 4 cohorts of Mortuary Affairs soldiers will be presented. There is a trend indicating the effectiveness of the TEAM intervention. Specifically, findings are presented on disorder, distress and health risk behaviors (e.g., increases in alcohol and tobacco use) for the intervention and control groups at 1, 2, 3 and 6 months post-deployment in order to evaluate the effectiveness of our TEAM intervention. Multivariate logistic analyses are used to examine the mediating effects of variables such as social support. Barriers to health care utilization will also be examined and reported.

Conclusions

Preliminary results suggest that MA soldiers are at increased risk for development of post-deployment disorders, distress and health risk behaviors. Preliminary results also suggest a trend that the TEAM program utilizing principles of Psychological First Aid may be an effective intervention for soldiers returning from deployment. This study potentially provides a model for reducing stress and increasing adaptive functioning that can be adapted to other soldiers and disaster workers.
EMPIRICAL EVIDENCE FOR A PSYCHOLOGICAL FIRST AID-BASED INTERVENTION IN SOLDIERS POST-DEPLOYMENT

Christine L. Gray, M.P.H., Carol S. Fullerton, Ph.D., Quinn M. Biggs, Ph.D., M.P.H., James Mccarroll, Ph.D., M.P.H., Lcdr Patcho Santiago, M.D., M.P.H., John H. Newby, Ph.D., M.S.W., Stephanie N. Riley, Natalie T. Kody, M.A., B.S., Chad A. Spiegel, M.A., and Robert J. Ursano, M.D.

Center for the Study of Traumatic Stress, Department of Psychiatry, Uniformed Services University of the Health Sciences, Bethesda, MD

BACKGROUND

U.S. Army Mortuary Affairs Soldiers (MA) recover, identify, and evacuate the remains of deceased military personnel and their personal effects from Iraq and Afghanistan. Those duties increase their risk for the development of distress, disorder and health risk behaviors. Evaluation of interventions that aim to reduce barriers to health care utilization and promote adaptive coping is needed.

NEW EDUCATIONAL INTERVENTION

TEAM (Troop Education for Army Morale): TEAM is a new education and skills training intervention to help MA Soldiers and their spouses reduce distress and foster adaptive coping in the months after deployment. TEAM integrates resources in the social context of home and unit to enhance the natural role of spouse and buddy support. Spouses are offered an equivalent intervention.

Basis of the Intervention: TEAM training is based on the evidence-informed principles of Psychological First Aid (PFA)1-3 and Cognitive Behavioral Therapy (CBT)4.

Psychological First Aid: PFA is designed to reduce the distress caused by traumatic events and to foster short- and long-term adaptive functioning and coping through the principles of Safety, Calming, Connecting, Self-Efficacy, and Hope and Optimism.

Cognitive-Behavioral Therapy: CBT is an approach to altering thoughts and beliefs that lead to emotions. It has been shown to treat and prevent PTSD successfully when administered early after trauma exposure. However, TEAM is education-based and NOT therapy or mental health treatment.

Delivery of Intervention:
- Interactive group workshops
- Educational handouts
- Toll-free phone line and email service
- Website (resources, training materials)
- Referral resources
- Concierge-type service
- Stepped collaborative care model1
- Support through spouse and buddy

Goals: The training of Soldiers is:
- Develop self-care skills and increase adaptive coping in response to stress
- Identify when an individual is in need of care
- Provide early support to foster rapid recovery
- Build supportive relationships
- Improve communication skills
- Promote health care seeking when needed
- Overcome barriers to health care utilization
- Address health risk behaviors (e.g., alcohol use)

PROCEDURES:
MA Soldiers at Fort Lee, Va. were randomized to receive the TEAM intervention (Workshop) or no intervention (Usual Services). Workshops were held at 1, 2, 3 & 6 months post deployment. Questionnaires were completed at return from military personnel and their personal effects from Iraq and Afghanistan. Those duties increase their risk for the development of distress, disorder and health risk behaviors. Evaluation of interventions that aim to reduce barriers to health care utilization and promote adaptive coping is needed.

METHODS

Participants: 86 MA Soldiers (Workshop Group N=46; Usual Services N=40)

• Gender: 70.1% male, 29.9% female
• Age: range 19-50 years (M=28.26)
• Education: 0%<HS; 37.7% HS/GED; 55.8% some college; 6.5% bachelors
• Rank: 10.4% Private or Private First Class; 81.1% Specialist or Corporal; 7.8% Sergeant (all enlisted)
• Race: 60.5% White; 15.8% Black; 13.2% Hispanic; 6.6% American Indian or Alaskan Native; 3.9% Asian or Pacific Islander
• Marital Status: 64.9% married; years M=4.27; 73.1% live with their spouse

MEASURES:
• Probable PTSD: PTSD Checklist (PCL-17): Probable PTSD if total symptom score ≥50 (range 17-85)
• Probable Depression: Patient Health Questionnaire (PHQ-9): Positive if 5 or more of 9 symptoms present and at least 1 symptom is depressed mood or anhedonia

PRELIMINARY RESULTS

Probable PTSD and Probable Depression (1 month post-deployment)

PTSD (N=54)

Depression (N=53)

27.8% 24.5%

23.1% Drank more than usual in the past month
19.2% Usually have 5 or more drinks at one time
8.8% Would be too embarrassed

31.5% Increased tobacco use in the past month
33.3% Felt in need of medical care, but did not obtain it
18.6% Would be too embarrassed

31.5% Decreased tobacco use in the past month
16.7% Felt in need of mental health care, but did not obtain it
18.5% Don’t trust mental health professionals

LIMITATIONS

• Self-selection to study and attendance
• Self-report measures
• Preliminary data (3 cohorts completed, 2 in progress, 1 more cohort expected)

SUMMARY AND IMPACT

These preliminary data suggest Mortuary Affairs Soldiers returning from Iraq and Afghanistan have high rates of PTSD and depression.

Soldiers returning from deployment report benefit from Psychological First Aid and Cognitive Behavioral Therapy-based early educational intervention.

Most participants described TEAM as being “Moderately” or “Quite a bit” helpful.

TEAM enhances the natural role of spouse and buddy support and addresses barriers to health care utilization.

Interventions of this type are needed due to the high number of Soldiers returning from deployment with psychiatric disorders and low mental health care utilization.

Findings have implications for use of this intervention with Soldiers in other military branches, first responders, disaster workers and others exposed to the dead.
