13. SUPPLEMENTARY NOTES
Presentation for SAE World Congress 2012.

14. ABSTRACT
1. The face sheets fulfill the Love-Kirchoff assumptions and are thin compared with the core.
2. The bonding between the face sheets and the core is assumed to be perfect.
3. The kinematic boundary conditions at the interfaces between the core and the facings are satisfied.
4. The core is assumed to be a weak orthotropic transversely compressible core carrying only the transverse strains and the normal strain.
5. The shock wave pressure is uniformly distributed on the front face of the sandwich plate.

6. Concluding Remarks
Sandwich Plates With A Compressible Core Impacted by Blast Loading

Motivation

• High bending stiffness and strength to weight ratio

• Excellent thermal and sound insulation

• Increased durability under a thermo-mechanical loading environment

• Tight thermal distortion tolerances

• Lightweight in structure
Basic Assumptions and Preliminaries

1. The face sheets fulfill the Love-Kirchoff assumptions and are thin compared with the core.

2. The bonding between the face sheets and the core is assumed to be perfect.

3. The kinematic boundary conditions at the interfaces between the core and the facings are satisfied.

4. The core is assumed to be a weak orthotropic transversely compressible core carrying only the transverse strains and the normal strain.

5. The shock wave pressure is uniformly distributed on the front face of the sandwich plate.

Fig 1. An asymmetric sandwich plate under blast loading
Sandwich Plates With A Compressible Core Impacted by Blast Loading

Theoretical Developments

Displacement Field

Top Face

\[ v_a^t = u_a^a + u_a^d - \left( x_3 + \frac{t_c + t_f^t}{2} \right) u_{3,a}^a - \left( x_3 + \frac{t_c + t_f^t}{2} \right) u_{3,a}^d \]

\[ v_3^t = u_3^a + u_3^d \]

Bottom Face

\[ v_a^b = u_a^a - u_a^d - \left( x_3 - \frac{t_c + t_f^b}{2} \right) u_{3,a}^a + \left( x_3 - \frac{t_c + t_f^b}{2} \right) u_{3,a}^d \]

\[ v_3^b = u_3^a - u_3^d \]

Core

\[ v_a^c = u_a^a - \left( \frac{t_f^t - t_f^b}{4} \right) u_{3,a}^a - \left( \frac{t_f^t + t_f^b}{4} \right) u_{3,a}^d - \frac{2x_3}{t_c} u_a^d + \left( \frac{t_f^t + t_f^b}{2t_c} \right) x_3 u_{3,a}^a + \left( \frac{t_f^t - t_f^b}{2t_c} \right) x_3 u_{3,a}^d + \left( \frac{4x_3^2}{t_c^2} - 1 \right) \Phi_a \]

\[ v_3^c(x, y, z, t) = u_3^a - \frac{2x_3}{t_c} u_3^d \]
Sandwich Plates With A Compressible Core Impacted by Blast Loading

Note:

the Greek indices have the range 1, 2, while the Latin indices have the range 1, 2, 3 and unless otherwise stated, Einstein’s summation convention over the repeated indices is assumed. Also, denotes partial differentiation with respect to the coordinates , while superscripts t and b indicate the association with the top and bottom facings respectively.

Also,

\[ u_i^d = \frac{1}{2} (u_i^t + u_i^b), \quad u_i^m = \frac{1}{2} (u_i^t - u_i^b) \]

represent the average and the half difference of the face sheet mid-surface displacements while, the core displacements, \( \Phi_c \) warping functions of the core.
Sandwich Plates With A Compressible Core Impacted by Blast Loading

Non-Linear Strain-Displacement Relationships

The strain-displacement relationships given by the Lagrangian Strain-Displacement Relationships used in conjunction with the Von-Karman assumptions is given in indicial notation as

\[
\begin{align*}
\gamma_{11} &= v_{1,1} + \frac{1}{2} (v_{3,1})^2 \\
\gamma_{22} &= v_{2,2} + \frac{1}{2} (v_{3,2})^2 \\
\gamma_{33} &= v_{3,3} + \frac{1}{2} (v_{3,3})^2 \\
\gamma_{23} &= \frac{1}{2} (v_{2,3} + v_{3,2}) + \frac{1}{2} v_{3,2}v_{3,3} \\
\gamma_{13} &= \frac{1}{2} (v_{1,3} + v_{3,1}) + \frac{1}{2} v_{3,1}v_{3,3} \\
\gamma_{12} &= \frac{1}{2} (v_{1,2} + v_{2,1}) + \frac{1}{2} v_{3,1}v_{3,2}
\end{align*}
\]
Sandwich Plates With A Compressible Core Impacted by Blast Loading

Constitutive Equations

Both the top and bottom face sheets are considered to be constructed from unidirectional fiber reinforced anisotropic laminated composites, the axes of orthotropy not necessarily being coincident with the geometrical axes. The stress-strain relationships for each lamina of the facings becomes

\[
\begin{bmatrix}
\tau_{11} \\
\tau_{22} \\
\tau_{12}
\end{bmatrix} = \begin{bmatrix}
\bar{Q}_{11} & \bar{Q}_{12} & \bar{Q}_{16} \\
\bar{Q}_{22} & \bar{Q}_{26} & \bar{Q}_{66} \\
\text{Sym} & &
\end{bmatrix} \begin{bmatrix}
\gamma_{11} \\
\gamma_{22} \\
2\gamma_{12}
\end{bmatrix}
\]

Where, \( \bar{Q}_{ij} \) for \( i, j = (1, 2, 6) \) are the Transformed plane-stress reduced stiffness measures.

The stress-strain relationships for the orthotropic core with the geometrical and material axes coincident are expressed as

\[
\tau_{33}^c = E^c \gamma_{33}^c, \quad \tau_{13}^c = G_{13}^c \gamma_{13}^c, \quad \tau_{23}^c = G_{23}^c \gamma_{23}^c
\]
Sandwich Plates With A Compressible Core Impacted by Blast Loading

Equations of Motion-Hamilton’s Variational Principle

\[ \int_{t_0}^{t_1} (\delta U - \delta W - \delta T) dt = 0 \]

\( U \) = strain energy,

\( W \) = represent the work done by external forces

\( T \) = represent the kinetic energy
Sandwich Plates With A Compressible Core Impacted by Blast Loading

\[ \delta U = \int_A \left( \int_{-t_c/2}^{t_c/2} \tau_{\alpha\beta} \delta \gamma_{\alpha\beta}^t dx_3 + \int_{-t_c/2}^{t_c/2} \tau_{i3} \delta \gamma_{i3}^t dx_3 + \int_{t_c/2}^{t_c/2+t_f^b} \tau_{\alpha\beta} \delta \gamma_{\alpha\beta}^b dx_3 \right) dA \]

Where \( \tau_{ij} \) are the tensorial components of the second Piola-Kirchoff stress tensor, while \( A \) is attributed to the area of the sandwich plate.

\[ \delta W = \int_A \left( \hat{q}_3^t(x_1,x_2,t) \delta v_3^t + \hat{q}_3^b(x_1,x_2,t) \delta v_3^b \right) dA - \int_A \left( 2C^t \dot{v}_3^t \delta \dot{v}_3^t + 2C^c \dot{v}_3^c \delta \dot{v}_3^c + 2C^b \dot{v}_3^b \delta \dot{v}_3^b \right) dA \]

Where \( q^t(x_1,x_2,t) \) denotes the transverse pressure loading from a spherical air-blast and \( C \) is the structural damping coefficient per unit area of the plate.

\[ \int_{t_0}^{t_1} \delta Tdt = \int_{t_0}^{t_1} \int_A - \left( \int_{-t_c/2}^{t_c/2} \rho_{f}^t \dot{v}_3^t \delta \dot{v}_3^t dx_3 + \int_{-t_c/2}^{t_c/2} \rho_{c}^c \dot{v}_3^c \delta \dot{v}_3^c dx_3 + \int_{t_c/2}^{t_c/2+t_f^b} \rho_{b}^b \dot{v}_3^b \delta \dot{v}_3^b dx_3 \right) dAdt \]

Where \( \rho_{c} \) and \( \rho_{f} \), \( \rho_{b} \) are the mass densities of the core and the top and bottom face sheets, respectively, and \( \dot{v} \) denotes the transverse acceleration.
Sandwich Plates With A Compressible Core Impacted by Blast Loading

Equations of Motion

\[ \delta u^a_a : \quad N^a_{\alpha \beta, \beta} = 0 \]

\[ \delta u^d_a : \quad N^d_{\alpha \beta, \beta} + \frac{N^c_{a3}}{t_c} = 0 \]

\[ \delta \Phi^c_a : \quad M^c_{a3} = 0 \]

\[ \delta u^a_3 : \quad u^a_3,\alpha \beta N^a_{\alpha \beta} + M^a_{\alpha \beta,\alpha \beta} + u^d_3,\alpha \beta N^d_{\alpha \beta} + \frac{1}{t_c} \left( \frac{2t_c + t_f + t_f}{4} - u^d_3 \right) N^a_{a3,\alpha} - \frac{2}{t_c} u^d_{3,\alpha} N^c_{a3} \]

\[
- \left( \frac{t_f \rho^t + t_f \rho^b + t_c \rho^c}{2} \right) \ddot{u}^a_3 - \left( \frac{t_f \rho^t - t_f \rho^b}{2} \right) \ddot{u}^d_3 - \left( \frac{C^t + C^b}{2} + C^c \right) \dddot{u}^a_3
\]

\[
- \left( \frac{C^t - C^b}{2} \right) \ddot{q}^d_3 + \frac{\dot{q}^t_3 + \dot{q}^b_3}{2} = 0
\]
Sandwich Plates With A Compressible Core Impacted by Blast Loading

\[ \delta u^d_3 : u^a_{3, \alpha \beta} N^d_{\alpha \beta} + M^d_{\alpha \beta, \alpha \beta} + u^d_{3, \alpha \beta} N^a_{\alpha \beta} + \left( 1 - \frac{2}{t_c} u^d_3 \right) N^c_{33} + \left( \frac{t_f^t - t_f^b}{4t_c} \right) N^c_{\alpha 3, \alpha} \]

\[-\frac{1}{2} \left( t_f^t \rho^t + t_f^b \rho^b + \frac{t_c \rho_c}{3} \right) \ddot{u}^d_3 - \left( \frac{t_f^t \rho^t - t_f^b \rho^b}{2} \right) \ddot{u}^a_3 - \left( \frac{C^t + C^b}{2} \right) \ddot{u}^d_3 - \left( \frac{C^t - C^b}{2} \right) \ddot{u}^a_3 \]

\[ + \frac{\hat{q}^t_3 - \hat{q}^b_3}{2} = 0 \]

Where, the global stress resultants and stress couples are defined as

\[ (N^a_{\alpha \beta}, M^a_{\alpha \beta}) = \frac{1}{2} \left\{ \left( N^t_{\alpha \beta} + N^b_{\alpha \beta} \right), \left( M^t_{\alpha \beta} + M^b_{\alpha \beta} \right) \right\} \]

\[ (N^d_{\alpha \beta}, M^d_{\alpha \beta}) = \frac{1}{2} \left\{ \left( N^t_{\alpha \beta} - N^b_{\alpha \beta} \right), \left( M^t_{\alpha \beta} - M^b_{\alpha \beta} \right) \right\} \]
and the local stress resultants and stress couples are given as:

\[
\begin{align*}
\{N_{\alpha\beta}^t, M_{\alpha\beta}^t\} &= \int_{-t_c/2 - t_f^t}^{-t_c/2} \tau_{\alpha\beta}^t \left\{ 1, \left( x_3 + \frac{t_c + t_f^t}{2} \right) \right\} dx_3 \\
\{N_{\alpha\beta}^b, M_{\alpha\beta}^b\} &= \int_{t_c/2}^{t_c/2 + t_f^b} \tau_{\alpha\beta}^b \left\{ 1, \left( x_3 - \frac{t_c + t_f^b}{2} \right) \right\} dx_3 \\
\{N_{i3}^c, M_{i3}^c\} &= \int_{-t_c/2}^{-t_c/2} \tau_{i3}^c (1, x_3) dx_3, \quad (i = 1, 2, 3)
\end{align*}
\]
Sandwich Plates With A Compressible Core Impacted by Blast Loading

Boundary Conditions

For the case of *simply supported boundary conditions*, the boundary conditions become:
Along the edges \( x_n = (0, L_n) \)

\[
N_{nn}^a = N_{nn}^d = N_{nt}^a = N_{nt}^d = M_{nn}^a = M_{nn}^d = u_3^a = u_3^d = 0
\]

\( n \) and \( t \) are the normal and tangential directions to the boundary. When \( n = 1, t = 2 \)
and when \( n = 2, t = 1 \)
Solving the governing equations, results in two nonlinear coupled second order ordinary differential equations in terms of the modal amplitudes. These are given as:

\[ m_1 \ddot{w}_{mn}^a + C_{10} w_{mn}^a + C_{11} w_{mn}^d + C_{12} w_{mn}^a (w_{mn}^d)^2 + C_{30} (w_{mn}^a)^3 = \frac{q_{mn}}{2} \]

\[ m_2 \ddot{w}_{mn}^d + C_{20} w_{mn}^d + C_{01} (w_{mn}^d)^2 + C_{02} (w_{mn}^d)^3 + C_{21} (w_{mn}^a)^2 + C_{21} (w_{mn}^a)^2 w_{mn}^d = \frac{q_{mn}}{2} \]

The coefficients \( C_{10}, C_{12}, C_{30}, C_{01}, C_{03}, C_{20}, C_{21} \) are expressions which depend on the material and geometrical properties of the structure.

These two governing differential equations are then solved using the 4th Order runge-Kutta Method.
Blast Loading

For a free in-air spherical air burst, the pressure profile over time is given in figure 4 as

\[ P_t(t) = (P_{so} - P_o) \left(1 - \frac{t - t_a}{t_p}\right) e^{-\alpha \frac{t - t_s}{t_p}} \]

- \( P_o \) is the ambient pressure
- \( t_a \) is the time of arrival
- \( t_p \) is the positive phase duration of the blast wave
- \( t \) is the time

Fig 2. Incident Profile of a blast wave
To validate the present approach, the dynamic response of a simply supported plate impacted by a uniform pressure pulse was chosen from R.S. Alwar et Al.

Fig 3. The non-dimensional global deflection-time response of a simply supported sandwich plate impacted by a uniform pressure pulse.

Fig 13. The counterpart of Figure 12 for the wrinkling response.
Sandwich Plates With A Compressible Core Impacted by Blast Loading

Concluding Remarks

The effect of a number of important geometrical and material parameters were analyzed with conclusions drawn.

Some of the important conclusions were:

- The wrinkling response seems to be diminished as the young’s modulus of the core is increased. The same is the case for larger rates of decay.

- For thicker cores, both the global and wrinkling responses are less severe.

- It was also revealed that the compressibility of the core has only a marginal effect upon the global response of the sandwich plate.

- One should keep in mind that both the stress and strain profiles should be determined to determine possible failure of the structure.
