13. ABSTRACT (maximum 200 words)
   Over the past ten years, the demand for UN Information Operations (IO) has grown, with the UN initiating or strengthening seventeen peacekeeping operations and increasing the number of deployed UN personnel. Given the growing demand for UN peacekeeping, we will examine, assess, and make recommendations for increasing UN Information operations during peacekeeping (IODP) effectiveness. This thesis will focus on UN information operations from a tactical methodology of peacekeeping operations utilizing the information hierarchy of needs in a post conflict situation. To determine whether the United Nations has established IODP, the following questions are addressed:

   What is more important: the IO message or the information system (IS)? Is a successful system sufficient for IO success? What is the information hierarchy? What impact does the information hierarchy have on peacekeeping operations? Who should deliver the message? How should the message be delivered? What is the structure for evaluating UN IODP? When, where, and how has the UN succeeded in utilizing IODP in missions? Where has it failed and what were the IO issues it faced? How can the United Nations and member countries better utilize information operations? How can the United Nations utilize the information hierarchy to garner public support in post-conflict environments? How do the tools used by the United Nations for managing expectations during peacekeeping operations effective?

   Specifically, in this thesis, we examine: (1) the evolution of UN IODP over the past decade; (2) the characteristics of ongoing IODP in case studies from Kosovo, Liberia, and Eritrea-Ethiopia; (3) the current structure for evaluating the UN IODP and the challenges, if any, the current structure poses, specifically in the previously mentioned case; and (4) countering disinformation efforts in IODP case studies.

ABSTRACT

Over the past ten years, the demand for UN Information Operations (IO) has grown, with the UN initiating or strengthening seventeen peacekeeping operations and increasing the number of deployed UN personnel. Given the growing demand for UN peacekeeping, we will examine, assess, and make recommendations for increasing UN Information operations during peacekeeping (IODP) effectiveness. This thesis will focus on UN information operations from a tactical methodology of peacekeeping operations utilizing the information hierarchy of needs in a post conflict situation. To determine whether the United Nations has established IODP, the following questions are addressed:

What is more important: the IO message or the information system (IS)? Is a successful system sufficient for IO success? What is the information hierarchy? What impact does the information hierarchy have on peacekeeping operations? Who should deliver the message? How should the message be delivered? What is the structure for evaluating UN IODP? When, where, and how has the UN succeeded in utilizing IODP in missions? Where has it failed and what were the IO issues it faced? How can the United Nations and member countries better utilize information operations? How can the United Nations utilize the information hierarchy to garner public support in post-conflict environments? How can the United Nations counter competing information? How do you manage expectations in a post conflict situation? Are the tools used by the United Nations for managing expectations during peacekeeping operations effective?

Specifically, in this thesis, we examine:(1) the evolution of UN IODP over the past decade; (2) the characteristics of ongoing IODP in case studies from Kosovo, Liberia, and Eritrea-Ethiopia; (3) the current structure for evaluating the UN IODP and the challenges, if any, the current structure poses, specifically in the previously mentioned case; and (4) countering disinformation efforts in IODP case studies.

We would like to acknowledge all our friends and family. Their encouragement has been invaluable. To be selected for this prestigious program at the Naval Postgraduate School has been a great honor for both of us. We could not have completed the program without the extraordinary support and advice from Dr. Dorothy Denning, our advisor and Dr. Hy Rothstein, our second reader. Lastly, we also want to thank the instructors, faculty, staff and fellow students at the Naval Postgraduate School. Their support and education throughout this program have provided many insights that contributed to our success.
I. INTRODUCTION

A. RESEARCH QUESTION

The literature on the United Nation’s (UN) usage of information operations is diverse. Some argue that the UN’s information operations program is functioning successfully while others believe there are issues and challenges within the organization regarding its approach to IO. Moreover, there is little analytical research on new generation peacekeeping which is more media savvy, aiming first at the host nations, and finally involving a two-way interactive approach towards the local people. In this thesis, to determine whether the United Nations has established effective Information Operations during Peacekeeping (IODP), the following questions will be addressed:

What are the UN IODP capabilities? What impact do information systems have on peacekeeping operations? When, where, and how has the UN succeeded in utilizing IODP? Where has it failed and what were the Information Operations (IO) issues it faced? How can the United Nations and member countries better utilize information systems? Does the UN have appropriate doctrines, policies, and strategies for information operations?

B. PURPOSE AND OBJECTIVES

The peacekeeping concept requires a better understanding of the use of the media for peaceful goals. This thesis intends to offer an empirical understanding of peacekeeping information operations based on case studies. This thesis will analyze how the United Nations Public Information Office utilized media tools in peacekeeping missions in Kosovo, Liberia, and Ethiopia to influence the population within the host nations and ensure the population supported United Nations peace goals. Additionally, this thesis seeks to illuminate lessons learned for future peacekeeping Public Information
campaigns. This research will analyze the outcomes of Public Information (PI) campaigns and other information operations, utilizing Maslow’s information hierarchy model.¹

C. BACKGROUND

Often the terms “Information Operations” (IO) or “Information Campaigns” (IC) are associated with the use of military information support operations, deception, public affairs, and electronic warfare; where information is used as a tool in national power.² However, according to the UN public information office, information operations might also be employed for peace, stability, and development.³ Indeed, the UN has been using information for peace and humanitarian goals since 1946 when the UN Department of Public Information (DPI) was founded. During peacekeeping operations, the UN utilizes information operations, but refrains from calling these procedures as such; it euphemistically calls them “Public Information Campaigns (PI)” or “Sensitization Programs.” These campaigns include, but are not limited to, online training programs, public awareness campaigns (e.g. mine awareness, election programs), public information campaigns about the peacekeeping activities and accomplishments, and counter-operations to negate malicious rumors.

This thesis will focus on examining how information operations can shape peoples’ attitudes and influence the population to support UN peacekeeping goals. Additionally this thesis will focus on how the UN IODP utilized the media and communication tools for peaceful aims. Information operations, by definition, cover all kind of activities that use information through media and communication tools in order to

²In military domains, IO is generally defined as an operation in which the information is used as a tool in national power. As it is displayed on the NDU webpage, it is “Information content and technology used as a strategic instrument to shape fundamental political, economic, military and cultural forces on a long-term basis to affect the global behavior of governments, supra- and non-governmental organizations, and societies to support national security strategies & objectives.” For more information see “Programs, Courses, & Services “ at http://www.ndu.edu/icollege/pcs/pcs_iscp.html (accessed 2/26/2012) and http://www.ndu.edu/icollege/pcs/pcs_iscp.html.

influence the behavior of a targeted group towards particular subjects. Since the UN aims to affect the peoples’ attitude towards peace, negotiations, and development, we will use the term “Information Operations during Peacekeeping” (IODP) in order to explain the strategy used by the UN to affect the behavior and attitudes of the host nations during peace operations. Indeed, when running a PI campaign the UN is not just delivering information but also expecting a positive societal outcome so that people will know more about the UN and its activities, encouraging them to promote and support peacekeeping operations within the host country. By the same token, throughout the thesis the terms PI and IODP will be used interchangeably.

In the wake of the Cold War, the collapse of the Soviet Union led to instability and internal conflicts in several countries. The end of the Cold War enabled cooperation and laid the groundwork for the development of UN peacekeeping operations to address the internal conflicts within these countries. Since the early 1990s, the UN has been conducting missions in these countries.

Meanwhile, rapid technological innovations have led to substantial improvements in almost every aspect of life, including information systems. Availability of the Internet, social networking, crowd sourcing, and cell phones facilitated the access to information in a timeless manner. These new developments provided more opportunities for the UN and other humanitarian organizations to employ information tools for the goals of the peacekeeping operations. There are also challenges that the UN needs to overcome. Some of the challenges the UN faces when intervening in these countries include: a lack of technology, an underdeveloped infrastructure, illiteracy, and poverty. Additionally, some of these countries have their own national agenda, or maintain a negative approach towards outside national or vocational groups.

Various arguments have been presented in order to explain the effectiveness of IODP. Some theorists argue that the United Nations has a strong information operations doctrine and practice, while others present strong criticisms of how the UN has an

---

4Lynn E. Davis, *Peacekeeping and Peacemaking After the Cold War* (RAND Corporation, [1993, Santa Monica, California]).
inadequate doctrine and ineffective tools to implement successful IODP. By exploring both sides of the argument, this thesis aims to examine the weaknesses and strengths of the UN IODP.

D. THESIS SCOPE

The UN’s new generation IODP and particularly PI campaigns target and affect the host nations in post-conflict countries, international media, as well as people and decision making mechanisms of these contributing countries. However this thesis does not intend to study the effects of the IODP on the international media or the contributing countries but rather confines itself to the effect on the host nations. The UN claims to use information tools only to inform and communicate with the local populations; however, this thesis asserts the UN utilizes IO and media tools to rouse a positive reaction from the population towards the UN goals in peace operations.

E. RESEARCH DESIGN

In order to understand the shortcomings—if any—of UN information operations, this thesis will examine case studies about UN Information Operations during peacekeeping operations (IODP) in Kosovo, Liberia, and Eritrea-Ethiopia, and will make recommendations for increasing their effectiveness in influencing the host population within these countries.

The United Nations’ information doctrine and practices are available through official UN documents as well as open source materials. Case studies are used to compare and contrast successful and unsuccessful examples of the UN IODP in order to understand strategies and to determine effective lessons and best practices. The thesis ends with recommendations on what should be done to improve United Nations information operation capabilities.

To illustrate the people’s need for information in the post-conflict countries, the thesis applies Maslow’s Hierarchy of Human Needs model to the IODP. Often ignored and neglected by peace researchers, the Hierarchy of Human Needs Theory may offer valuable insights into the sources of conflict and thus possible resolutions. Basically all
human beings want recognition and respect. The authors attempt to make a connection to link this simple example to the inner mechanisms of humanitarian organizations and illustrate how Maslow’s Hierarchy of Needs can be used for political gain and influence within a population.

Overall, this thesis will incorporate and focus on strategic communications during peacekeeping (the message), open source intelligence during peacekeeping (the reality), and joint information operations and electronic communications (the technology). Chapter II reviews the literature on how Maslow’s Hierarchy of Needs theory can be applied to the need for information in post-conflict zones, and also comprises a general overview of the UN’s usage of media tools in order to disseminate its messages in post-conflict zones and affect the behaviors of the population towards peace and reconciliation. Main terms are also defined in Chapter II. Chapter III discusses the challenges of IODP in peacekeeping countries, the innovations and evolution of the concept, and the role of the media. Chapter IV comprises case studies in which the UN IODP in Kosovo, Liberia, and Eritrea-Ethiopia, as well as the media and socio-historical context are evaluated and examined. Chapter V compares and contrasts these cases and analyzes the successes and failures of these campaigns. Additionally, Chapter V examines how the UN can increase the effectiveness of its peacekeeping activities by better implementing IODP. Lessons learned and recommendations are also drawn in this chapter for future cases.
II. INFORMATION HIERARCHY AND INFORMATION OPERATIONS DURING PEACEKEEPING

A. WHAT IS THE MASLOW HIERARCHY?

Maslow’s Hierarchy of Human Needs Theory may offer valuable insights into the sources of conflict, and thus possible resolutions. This chapter looks at how Human Needs Theory can be applied to UN Information Operations during Peacekeeping (IODP) in Kosovo, Liberia, and Eritrea-Ethiopia. These countries are called post-conflict countries, which assume that the fight is over; however, it does not necessarily mean that the conflict is totally terminated. It is true that in the post-conflict environment violent is not as tense as it was during the conflict times, but there are still some remaining ill-sentiments that obstruct peace. In these zones, however, the conflicting parties are generally tired of skirmishes resulting in them being more prone to peace than they are to fight. As Dan Lindley puts it where peace and war hang in the balance—or the peace surpasses the conflict—there is more need for information operations, and these operations are likely to prosper.\(^5\) If this need is addressed strategically, the behaviors and attitudes of the involved groups in the host nation can be improved significantly.

Basically, all human beings want recognition and respect; the withdrawal or denial of recognition and respect, experienced as humiliation, is the strongest force that creates rifts between people and breaks down relationships.\(^6\) Maslow’s Hierarchy of Needs provides an example of inherited behaviors influencing played strategies. The Hierarchy of Needs “is a construct, derived from the theory of human motivation,” advanced by Abraham H. Maslow during the mid-twentieth century, and essentially says all individuals pursue a hierarchy of needs that in large measure is based on self-interest, thus accounting for their behavior. What was found of interest was a connection that

\(^6\)Abraham Maslow’s Hierarchy of Needs and Diagrams of Maslow’s Motivational Theory - Pyramid Diagrams of Maslow’s Theory.
attempted to link this simple example to the inner workings of organizations that use Maslow’s Hierarchy of Needs for political gain and influence within a population.

A direct connection between influence within a population and the social and physical needs of that population can be seen in Maslow’s analysis of behavioral strategy. According to Maslow, human beings have physiological, psychological, and sociological needs such as food, clothes, safety, belongingness, love, esteem, and self-actualization and their motivations generally move through a pattern made up of variation, selection, and reproduction.\(^7\)

- **Variation**: People choose and use dissimilar strategies by accident, by design, or via trial and error.
- **Selection**: Environment (in this case, other players) will reward some strategies with higher payoffs.
- **Reproduction**: Strategies are “reproduced” via social transmission, imitation, learning, et cetera.

His work showed that though societies provide what appears to be the greatest happiness for the greatest number; this state may not be evolutionary stable. A society of this form can be considered to be made up of altruistic doves. As long as only doves are added to the society nobody will fight with anybody else. However such a society will be upset by the introduction of a hawk that comes in and takes the unit of “food” without opposition. The hawks then will thrive and multiply until there are so many that hawks begin to clash with each other. This clashing will keep the hawk population in check.

If one takes an organization that engages in ethnic conflict to be the hawks and the rest of the normal population to be doves, a situation will undoubtedly result in an increase in recruiting and ethnic conflict until there are too many of them, and they begin to clash against each other. A more likely result is that another “type” of hawk is added into the society. This second type of hawk is known as “Law Enforcement Services,” “the

---

State”, or “the United Nations Peacekeeping Forces.” In order to address the need for information among the conflicting hawks and dove population, the UN peacekeepers need to use IODP.

B. STRUCTURE EMPLOYED TO EVALUATE THE INFORMATION HIERARCHY

As the second type of hawk, the UN Peacekeeping Forces should resolve the problems that are introduced by the first type of hawks. These solutions include healing the wounds inflicted by the first hawks by providing aid distribution; protecting the doves from the hawks (peacekeeping and supporting law enforcement); preventing the hawks from inflicting more pain on doves, in other words, enacting Demobilization, Disarmament, Reintegration, and Resettlement (DDRR); and finishing the skirmishes between hawk gangs (negotiations). By making all of these attempts known to the community of doves, these second hawks will improve the doves’ behavior and gain their support through peace (IODP).

Information operations can help the UN connect with the motivations and needs of the local population, which in turn enables PI officers to organize, coordinate and execute widely disbursed operations. This section explores the importance of the host population in the UN IODP, and the relevance of the Hierarchy of Needs in PI campaigns. There is great value in understanding how the one constant in information operations—human nature—and its hierarchy of needs fit into PI campaigns and how IO campaigns therefore can and should be built around the Hierarchy of Needs. Maslow’s work, directed toward understanding the human psyche, provides valuable insight into human nature. It is this insight that is applicable to the development and implantation of effective information operations during peacekeeping.

Maslow’s hierarchy, illustrated in Figure 1, is divided into five basic areas of essential needs. The five basic needs that Maslow addresses include the top needs: self-actualization, esteem, love and belonging, safety, and the bottom physiological (breathing, food, water) needs.

---

As has been demonstrated throughout history, relationship-building is based on this Hierarchy of Needs. Information operations which address the Hierarchy of Needs have been powerful force multipliers, often directly contributing to success. A better understanding of the Hierarchy of Needs will lead to new tactics and methods to enable the UN IODP to favorably influence the will of the civilian population to support their activities and undermine spoilers and those spoilers’ disinformation within the local population. The Hierarchy gives the UN IODP an inside look on human motivations and explains (to a point) why influence can be such a compelling factor in the implementation of IODP and Public Information campaigns. Perhaps the most important conclusion is what critical information requirements have to do with understanding the attitudes, beliefs, and mood of the local civilian population. Understanding the nature of the technical information and the infrastructure of communications, studying the messages being put out by the local and international media, and assessing the combination of spoilers and disinformation are all helpful, but they cannot substitute for a good understanding of the hierarchy of needs and the pulse of the local populace. Therefore, IODP activities must be aligned based on humanitarian needs of the conflict-affected local people.9

9Abraham Maslow’s Hierarchy of Needs and Diagrams of Maslow’s Motivational Theory – Pyramid Diagrams of Maslow’s Theory.
Before answering the questions of whether the UN has favorable policies, doctrines, and strategies, one must first examine how information operations can be defined. Although the UN does not have a specific definition for their information operations and campaigns, official UN sites give enough evidence concerning the organization’s approach towards IO. Due to the bad connotations of IO components, such as deception and disinformation, the UN refrains from using the term IO, instead
euphemistically calls them Public Information campaigns or Sensitization Activities; however, this thesis asserts that the UN’s activities can be recognized as IO, due to the fact that these activities aim at a behavioral and attitudinal change in the targeted populations, albeit for peaceful purposes. Therefore this thesis entitles all UN activities using media and communication tools in order to increase awareness and improve the attitude of the people towards peacekeeping activities as Information Operations during Peacekeeping (IODP). The goal of peacebuilding, in general, is a change in the community from conflict and hatred to peace and tranquility. IODP can make this transition quicker, smoother, and more effective.\(^\text{10}\)

Figure 2 illustrates how media and other communications tools can be used for a behavioral change within the society.

Figure 2. Expected Societal Change as an Outcome of the UN IODP (From Bratic and Scrich 2012)

Using the terms outlined on the United Nations’ public information website, a simple definition of IODP can be understood as UN processes that are being utilized to disseminate global messages to local audiences and to promote global awareness and greater understanding of the work of the United Nations. The website mentions that in

order to achieve these goals, the UN utilizes various communication tools including radio, television, newspapers, the Internet, videoconferencing, and increasingly other new information technology.  

Technology is a significant component in modern peacekeeping information activities. Technological innovations make access to the information easy and fast. For this reason, Armistead emphasizes technology when discussing his views on IO and describes IODP as the “use of modern technology to deliver critical information and influential content in an effort to shape perceptions, manage opinions, and control behavior in an environment in which time zones are as important as national boundaries.” However, in some cases socio-economic and infrastructural shortcomings of the post-conflict zones pose challenges to new technology and innovation. For example, in order to reach people who do not have access to a computer or who cannot read, the peacekeepers often have to rely on pre-Internet technology that includes the radio or face-to-face interaction.

The term Public Information (PI) campaigns can be used interchangeably with IODP. Ross Howard describes the PI as “a proactive media based intervention.” A peacekeeping force uses the media to counter disinformation, take actions to provide immediate information about peacekeeping activities, and to program intended outcomes such as transforming attitudes positively, promoting reconciliation, and reducing conflict. Public Information campaigns are a component of IODP and as such are defined as media campaigns that provide real-world information to the targeted population. In these media campaigns, the UN disseminates positive information in line with anticipated goals and counters disinformation that has been disseminated by spoilers.

---

13Howard, “An OperationalFramework,” 10–11. Ross Howard classifies media based interventions into five categories and proactive media based intervention is the fourth category in this typology.
The term IO is also used interchangeably with information campaigns conducted by humanitarian and civilian actors. According to Avruch et al., the peaceful usage of IO relates to the terms of public relations, press relations and advertising, problem solving, diplomacy, and perception management over contesting parties.  

C. STABILIZATION AND PEACEKEEPING OPERATIONS

Peace building can be defined as the international efforts to identify and support the structures that will strengthen the peace and prevent relapse of the conflict in a post-conflict country followed by peacekeeping efforts that aim to stabilize the country and heal the wounds of war or internal conflict. According to the UN, peacekeeping is supposed to be a temporary measure and thus should be accompanied or followed by peace-making activities which will peacefully settle the conflict. According to Howard, these efforts should be intensified in order to establish a lasting peace and resolve the discrepancies within that post-conflict society. As the term “post-conflict” denotes, in these societies, conflict is somehow ceased and combating parties agreed in some way to end the conflict. Local actors may act willingly towards peacekeeping and reconstruction, yet they typically lack the means and power to do so. The bad memories of the conflict and bias toward each other also undermine the impartiality of any indigenous actors. Therefore the need for external aid from the UN and other impartial third parties is inescapable.

The UN and other peacekeeping institutions generally run missions in post-conflict countries. These missions depend on Security Council resolutions and comprehensive peace agreements with the state and conflicting parties. The agreement generally describes the duties of the mission as well as its mandate, responsibilities, and power. The use of media and IODP are also defined in the agreement. Sometimes a lack of democratic culture can show itself in the shape of fear from criticism in the media thus

---

15 Davis, Peacekeeping and Peacemaking After the Cold War, 32.
leading to resistance from the state toward peacekeeping media activities in the territories. However, the importance of IODP allows the UN to convince the local government to yield some of its sovereignty over the media thereby operating in favor of both UN media operations and local media freedom.

Peace building efforts generally start with confidence building activities such as providing security, imposing and observing ceasefire arrangements, assisting troop withdrawals, providing buffer zones between conflicting groups, and delivering humanitarian aid. The first international actors in the field are therefore non-governmental organizations (NGO), the UN military, and the UN police. After reaching certain success in these first tasks of confidence building, the peacekeepers turn their efforts to facilitating building and instituting activities for developing and reconstruction.

IODP accompanies all of the abovementioned peacekeeping activities. UN Information Operations campaigns utilize the media to ensure they report on activities that represent the United Nations and its peacekeeping efforts in a positive light. This fosters assurance and optimism within the population as well as establishes the groundwork for local collaboration with the population in future endeavors. The media is also essential for peacekeepers to let people know where to find aid materials, when programs will happen, and how they will be accomplished. Therefore, the use of media and particularly IODP is an important element in peacekeeping.

D. IMPORTANCE FOR IODP AND PI FOR PEACEKEEPING

In all United Nations (UN) peacekeeping operations, an effective communications strategy that includes good relations with both local and international media is a political and operational necessity. A peacekeeping operation may enjoy initial worldwide support, but without an effective and consistent public information program, support can quickly turn to apathy and even opposition. Peacekeeping operations require the understanding, cooperation, and support of all players—local and external—to fulfill their mandates. These include the parties to the conflict, the local population, and the

international community whose political and material support is fundamental to the success of a peacekeeping mission.18

Martti Ahtisaari, a Nobel Peace Laureate and former Special Representative to the Secretary General of the UN for Kosovo, believes that information and communication systems—with good management of information operations and information sharing—can help the humanitarian community solve the crisis and save lives.19 He points out that the information systems have already proved they have potential to reduce loss of life; provide decision makers with timely crucial information; enable evaluation of feedback from recipients of the aid material; create institutional memory, which is critical given the fact that the humanitarian staff works in rotation; provide early warning signals of conflict and threats; and improve the security of humanitarian personnel.

One of the noteworthy peacekeeping experts in the field, Ambassador Robert B. Oakley, the U.S. President’s special envoy to Somalia during UNOSOM and UNOSOM II realized that PI was essential in public relations and media relations.20 According to Oakley, if a humanitarian organization is defeated by their enemy in public information, they will fail to convey their message to the mass population, and therefore, their link to the public will be broken. This can be more damaging in a case where the other party has a strong IO capability, particularly a good disinformation campaign. It is at this point that the “rubber often meets the road,” and the UN can start to lose the popular support of the host nation.21 Only with the correct usage of IO tools can the effectiveness of the

---

20Osman Mentes and Rob Hagerty, How to Stabilize Failing States: The Good the Bad and the Ugly of International Intervention (Monterey, CA: Naval Postgraduate School, 2011), PG#. Peacemaking and peacekeeping activities in Somalia faced the challenge by a media-savvy warlord, Mohammad Aideed who ran a radio station and a newspaper against UN and U.S.

peacekeeping operations be increased, the message to the population be more easily conveyed, and the effect of disinformation campaigns be countered.

Indeed, there is hope that IODP can significantly contribute to peacekeeping operations. The regions where UN peacekeeping missions operate are often called post-conflict zones. In these zones, the conflict has usually ceased and the conflicting parties are generally more prone to peace than they are to conflict. Lindley eloquently illustrates this distinctive feature of peacekeeping environments:

Where aggressors are determined, there is little to stop them, but where peace and war hang in the balance, there is evidence that information operations can coerce violators into better behavior. Combined with the clear benefits of explaining the mission, teaching about elections, defusing rumors and misperceptions, there are few if any sound reasons to proceed with more robust information operations.22

There is no doubt that the UN missions need public support of the host nations. Providing true and reliable information in the fragile structure of post-conflict environments is essential in increasing the awareness of the people and thus their support through the mission. In any situation that involves natural disasters such as the Haiti Earthquake, or human-made disasters, such as Darfur, having access to timely and reliable information will save lives, increase cooperation, and allow humanitarian actors to have better results.23 The questions then become: Does the UN have favorable IO doctrines, policies, and strategies? Contemporary peacekeeping is not simply delivering aid to local people and enforcing procedures while providing the people with information, but rather it is working with the grassroots of the general public, communicating with them, and encouraging them to support the efforts towards the peace process.24 Therefore, modern IODP requires a change from traditional understanding of being an information provider to becoming a communicator through the local perceptions

22Lindley, Untapped Power? The Status of UN Information Operations, 15.

23Stauffacher et al., ICT for Peace Foundation » Peacebuilding in the Information Age: Sifting Hype from Reality, 4.

and opinions. As Chapter III shows, this interactive approach not only provides feedback from the population but also improves communication between peacekeepers and the host nation.

E. TRUST, INFLUENCE, PEACEKEEPING INTELLIGENCE AND COUNTERING DISINFORMATION (THE REACTIVE)

Trust of local people can be managed and increased during IODP. As mentioned above, IODP aims to influence host nations in order to increase their support towards peacekeeping activities. If the peacekeepers can gain person-based and category-based support from the local population, it will be easier to influence people towards peacekeeping goals. Person-based trust can be developed by person-to-person interaction over time while category-based trust can be gained through managing the local population’s assumptions about the UN and their activities.\(^{25}\) The local population needs to be able to identify how UN peacekeepers perceive and act in specific situations. Person-to-person and category-based interactions provide information about what the UN members are likely to do in specific situations, and this information turns into local opinion about what peacekeepers are likely to do on a consistent basis. Overall, trust earned from the population can be defined as a mental perception that enables them to sense and judge UN peacekeepers and their activities, predict UN members’ behavior in certain situations, and help the local population develop a trusting relationship with UN personnel, which in turn allows them to act accordingly.\(^{26}\)

Political leaders have long understood the power that comes from trust, influence, and attraction. If one can get another to want to do what the first party wants, then the first party does not have to use carrots or sticks to make the other individual do it. Trust and influence is a staple of daily democratic politics. The ability to establish preferences tends to be associated with intangible assets such as an attractive personality, culture, political values and institutions, and policies that are seen as legitimate or having moral authority. If a leader represents values that others want to follow, it will cost less to lead.

\(^{26}\)Ibid.
If an individual can be persuaded to go along with another’s purposes without any explicit threat or exchange taking place, influence is then at work; however, it would not have occurred without that first personal connection.

The United Nations needs to readjust its outlook on IODP to quickly detour disinformation and rumor campaigns that are often propagated by the enemy during post-conflict operations. When disinformation or rumor campaigns occur, the primary duty of the field officer should be to engage the local media immediately to ensure that information is reported as accurately and as honestly as possible with updates provided as more information becomes known. Confronting disinformation is a difficult problem in the delicate political environment of a peace operation. In fact, responding to the parties’ disinformation occasionally seems to be beyond the capabilities and certainly outside the perceived mandates. However, disinformation continues to thrive in UN IODP campaigns.

In peace operations the use of force is considered as negative inducement and therefore should only be used as a last resort. IODP on the other hand, is one of the most important positive inducement tools at a leader’s disposals to convince the people towards peace and resolution. The United Nations must realize that the enemy, whose objective is to influence the insights and perceptions of various target audiences through media outlets, is fully aware of the importance of the battle for hearts and minds. To combat this enemy objective, UN information officers involved in IODP in post-conflict areas need to engage with the media and local population in a very intimate level so that these people might perceive peacekeepers as friends.

According to neuro-economist Paul Zac when among friends, one feels better and even gets less sick, because the human body releases oxytocin. Oxytocin, the hormone responsible for mother-baby affection is recently discovered to be also responsible for stimulating trust and empathy. Zac has discovered that as social animals the human

---

brain reacts to media interaction the same way they do in physical engagement with friends. When an individual is among friends online or in their physical presence, they feel better because oxytocin enables him to interact easily and works as a glue to adhere him with family, friends, and society. This is why two-way communications and interactions are important for IODP. Since the Transitional Authority in Cambodia (UNTAC), the UN has realized the importance of popular support from host nations towards peace and peacekeepers and has since begun using the media to increase this support. Earlier the media was used for one-way information, dissemination, and propagating but later took on an interactive approach through radio and television call-ins, text messages, new generation-friendly meetings, and surveys. Following this understanding, according to Charles Hunt, the PI sections have become a main element in peacekeeping operations and have begun to win the hearts and minds of the host nations towards the respective mission and its goals.29

III. EVALUATING THE CURRENT STRUCTURE OF THE UN IODP INFORMATION SHARING CHALLENGES IN THE UN IODP

The UN needs to reexamine the strategies it employs to increase the effectiveness of its IODP without compromising its transparent nature. Conversely, the UN’s organizationally transparent identity hinders it from making use of every benefit of intelligence gathering. The UN IODP is expected to collect and utilize information in a way that is conceptually suitable to its organizational identity. The cultures and values within various other organizations that the UN partners with, particularly the military, is organically not the same with the values within the humanitarian community. The differences in IO philosophy often jeopardize joint cooperation, particularly in information sharing. This is extremely evident when the UN participates in joint operations with NGO, military, and civilian partners. There is continuous interaction and overlap between civilian and military components during peacekeeping. This overlap in mission, requirements, and goals involves reciprocal understanding of civilian and military elements. According to Avruch et al.:

Although the UN is a civilian-centric organization, and the military is—in principal—commanded by civilian authorities in peacekeeping operations, it is the military to generally first arrive in peacekeeping missions and therefore, it is key that other actors like NGOs, civilian leaders, UN police and indigenous elements understand [the] military’s approach towards information operations.

Additionally, the military elements that take part in peacekeeping activities should also understand the different approaches of other actors in peacekeeping efforts and readjust their approach towards IODP. For example, during a Naval Postgraduate School (NPS) Educational Game Scenario dated January 2010, most of the participants who were from humanitarian, governmental, and military communities easily agreed that the greatest challenge to the humanitarian affairs during peacekeeping operations was the

---

31 Avruch, Narel and Combelles-Siegel, Information Campaigns for Peace Operations.
difficulty in information sharing in this rapidly changing environment. In their report, the biggest reason for this difficulty was projected as the huge cultural differences and institutional baggage in interagency relations. The military tends to classify most of the information as secret, while the NGO members and other humanitarian actors can try to retain most of the information due to their bias against military as well as their perfectionism for neutrality.

The UN IODP typically requires information sharing and transparency, while the military IO characteristically requires secrecy, informational security, and intelligence gathering. Table 1 illustrates the contrasts of military IO and IODP.

As to IODP in Liberia, the United Nations Mission in Liberia (UNMIL) somehow managed to address the above-mentioned challenges between civil, military, and police units and enabled them to support an agreeable approach towards information requirements. The PI sections of military, police and civil units of the mission managed to collaborate and assist in bringing the military information sections from secrecy and opacity to transparency and information sharing.

Table 1. A Comparison of Military IO and IODP.

Although the UN avoids using the terms IO and PSYOPs and prefers PI instead, by definition it is not easy to avoid the similarities or commonalities of the terms. For example desiring a behavioral change or an intended outcome is not foreign to UN PI campaigns. A campaign for Demobilization, Disarmament, Reintegration, and Resettlement is aimed to increase awareness in the population on how it is necessary to solve problems without bloodshed and how prevention of violence is essential to avoiding ethnic conflicts. The media is normally expected to mirror things as they happen or at least with minimal interpretation, in order to stay objective and impartial. This is often where UN information campaigns typically run into problems. IODP campaigns
(as one will see through the examination of the following case studies) often involve influence and bias, both attributes that can be camouflaged through truth. Most of the information we obtain comes from the media. This includes television, radio, newspapers, magazines, and the Internet. We tend to treat the media as important and reliable resources for information. So much so that many people may fail to understand that news can often be misleading. Although it is clearly naïve to believe that any source of information can be truly unbiased, it is necessary for the UN to attempt to maintain as much objectivity as possible. Unfortunately, in the United Nations Public Information campaigns, the trend has steadily moved towards the mixing of editorial content and sensationalism. This is what makes the UN IODP resemble military IO and diverts it from a more objective approach to PI campaigns.34

A. TECHNOLOGICAL INNOVATIONS AND THE EVOLUTION OF IODP

In the early phases, media usage by the UN was only focused on providing information to the local population regarding peacekeeping activities and accomplishments. According to Howard, the logic was basic; the media campaigns would inform people, and the people would see and understand the facts and make their decision on how to behave. The belief was that if the media can enable people to see their world, they would choose the way of peace.35 However, in time a more active approach was adopted; the media campaigns began aiming at a social outcome: to change the attitudes of the people, making them more peace-prone as opposed to conflict-prone. These first steps of IODP started as a one-way propaganda method from sender to receiver and targeted the public opinion and donors in contributing countries, international media, and host nations—in this order. However, thanks to the technological innovations and increasing understanding, it evolved through an interactive media activity most primarily targeting the host nations of peacekeeping missions. The new approach is more friendly and informal as opposed to the formal propaganda stereotype of traditional IODP. Besides, the new approach brought a two-way interactive communication with the host

nations not only disseminating information, but also enabling feedback from audiences through surveys, face-to-face communications, live call-ins, text messages, and emails. Evaluation of this feedback facilitated the humanitarian actors to review and update both IODP and other humanitarian activities. The United Nations Mission in Liberia and its radio were particularly significant in this transitional progress.

Before the information revolution, IO was typically used to shape psychological operations (PSYOPs) resulting in a monopoly of the nation-states over information. The nation-states have long enjoyed this monopoly by controlling the media through media campaigns, Public Information campaigns, disinformation, and even media censorship to opposing forces. However, the rapid technological innovations in information systems made one-sided control over media outlets almost impossible. Another effect of these technologies was new technology that crossed established state and country boarders. New Technology has blurred the borders between the states and decreased the effectiveness of customs and other preventive measures by the states. Thanks to the low cost, fast, and effective features of information technologies such as the Internet, satellite radios, satellite TVs, and cell phones, the information began to pass borders with more ease. Other actors also began using IO to counter nation-states’ campaigns as well as to propagate their own messages. As Armistead points out, the difference of contemporary IO from traditional IO derives from “the availability of low-cost high technology that facilitates nongovernmental organizations (NGOs) and other non-state actors including terrorist groups, to fulfill their own communications.”

In the light of the abovementioned developments, the UN and its partners began making better use of the contemporary IO tools and technologies in favor of the people of the war-torn areas and failing states during peacekeeping operations. The authors of this thesis assert that effective usage of IODP helps peacekeeping, community, and other humanitarian actors receive more popular support from host nations and therefore make better accomplishments in their honorable goals such as helping the vulnerable; promoting peace; assisting demobilization, disarming, and reintegrating ex-combatants

---

(DDR)\(^{37}\); delivering food, water, medicine, and shelter; clearing mine zones; repatriating the Internally Displaced Persons (IDPs); and saving lives.

Before the UN’s engagement in IO, several international NGOs conducted several activities to increase the awareness in the populations and to transform their attitude towards peaceful goals. However, the UN Peacekeeping PI sections became the trailblazers in the field and were used as an example by other actors like NATO and the EU.\(^ {38}\) The UN’s new approach to information operations gradually increased. The first attempts were during the Congo and Sinai peacekeeping operations with basic PI materials.\(^ {39}\) The UN managed to explain their presence to the host populations and subsequently increased their effectiveness by applying the lessons learned during their preceding operations in several countries. In Cambodia, the UN started media development tasks in peacekeeping activities. This was the first time, according to Howard, that the UN launched a major media development initiative in its support of a democratic transition. Before this involvement, the UN rarely engaged in news media development and generally did not see it as an important element in conflict resolution.\(^ {40}\)

The IODP in Liberia was revolutionary in several aspects. UNMIL was the first example to have an integrated PI section in a UN mission and the PI section utilized a two-way interactive approach with the media’s audience. Earlier, in 1992, in the planning phase of the UN mission in Cambodia (UNTAC), only a PI specialist was deployed to review the media context in a mission area; however, in Liberia, it was not only the specialist but also a PI unit who were deployed. In Cambodia, the PI expert appraised the coverage of local media, the identities and political affiliations of the media actors, and the overall functions of the media in the community.\(^ {41}\) These pre-assessments helped UNTAC better understand the unique features of the social and media context in the

\(^{37}\)DDR is also commonly used as DRR, representing the third are rehabilitation.

\(^{39}\)Ibid., 6.

mission area and thus the requirements for the PI strategy in the beginning of the mission. Likewise and even more successfully, during the planning phase, the PI section was sent to the UNMIL, and PI personnel launched a robust PI campaign immediately, starting the Radio UNMIL broadcast from day one. As mentioned above, another revolutionary aspect of the Liberia mission was the change in the primary target audience from the international media and contributing countries to the host populations. The importance of support from the local population was appreciated from the beginning phase of the mission. To increase the effectiveness of the PI campaigns, a new approach of interactive—two-way—broadcasting was also adopted. Radio UNMIL enabled call-ins and text messages, media monitoring unit-fulfilled surveys and other media evaluation methods, media outreach, unit-organized friendly meetings with local groups, and feedback from the entire audience. All were observed carefully. This let the authorities plan how to execute incoming operations accordingly, get rid of any shortcomings, and have a better understanding of how the mission activities and IODP were perceived by local populations. The feedback had another important function as an early warning system. It enabled the peacekeepers to sense if there was a likelihood of conflict between opposite groups and also if there was a plan against the peacekeepers. It may have provided enough time to address the causes of the conflict and apathy or antipathy against peacekeepers and take necessary actions.

B. UNDERSTANDING THE SOCIAL AND MEDIA CONTEXT IN POST-CONFLICT ZONES

Before judging the UN’s PI campaigns in post-conflict areas it is necessary to understand the social structure of the people and the situation of the local media. What are the basic layers of the community? What are the intergroup relationships? Who are the opinion leaders? What are the basic media outlets, and are they free or under suppression from government? Are the media outlets biased or polarized? What is their coverage and technological infrastructure? This section analyzes both common features of PI campaigns in the post-conflict environments and Chapter IV scrutinizes common

---

and specific features of each country with an emphasis on similarities and differences in the social and media contexts of these countries. A critical analysis of these operations identified several major factors that made UN information operations effective or ineffective. These factors include whether the UN PI campaigns had influence over all key channels of information, had great intelligence “feedback” on their information operations, had high-level and centralized control over IO planning, subordinated information operations to strategic and operational objectives, maintained adequate command and control, and provided sufficient time for Public Information campaign execution. These factors are still relevant for today’s operations.

Usually media needs to be repaired and supported in the post-conflict times. A free, responsible, and sensitive media should be created and supported in order to raise awareness in the nation, reduce the tension between groups, and improve the bonds within the civil society. This type of journalism is called “Conflict Resolution Journalism” or “Peace Journalism” by the Center for Journalism Ethics.43

Although the media is expected to be impartial, telling only the truth, it is used in Information Operations as a tactic to affect the hearts and minds of the targeted people. For example, as a mouthpiece of a UN mission, a UN radio station in a post-conflict region logically intends to increase optimism in the host nation; therefore, this station should not be expected to highlight any shortcomings of the peacekeepers or in case the conflict escalates, this station is not supposed to mirror this escalation. It will understandably try to calm down the population and understate the conflict. In IODP, the media should be used as a tool for peace and development goals; therefore, this thesis assumes that it is not an ethical dilemma that the selective reporting compromises the media’s impartiality for the reason that media is being used for a greater good.

Some local media outlets cannot live up to their professed values. Because of the lack of education and low incomes of novice journalists, local media may tend to spread

rumors and myth. This type of biased media does little to reduce the ethnic tension and can, in fact, exacerbate it. Turkish and Greek relations in Cyprus have long undergone ethnic tension. According to Georgios Terzis, ninety-five percent of Turkish people feel that Greeks are not to be trusted even though ninety-three percent have never actually met a Greek, while seventy-three percent of Greek people feel that Turks are not to be trusted with seventy percent of them having never actually met a Turk. Among the other factors, much of this bias stems from the local media’s misrepresentation of both sides. Additionally, some media outlets can be used by spoilers against other groups and even peacekeepers. It is also a necessity to counter spoilers’ antagonistic media campaigns, such as Serbian radio and television programs in Kosovo, and warlords’ such as Somalia’s General Aidid’s radio station, *Voice of the Somali People*.

Local media is generally under suppression of the state in post-conflict countries, and therefore journalists must attempt to refrain from criticizing the government’s activities. Even advertisers in some countries hesitate to work with impartial or critical media because of the fear of retaliation from their government. As for UN media outlets, they use a peaceful diplomatic language thereby eschewing any direct criticism of the government. However, an organization such as the UN should support the local media, emphasize freedom of the press, and advise the local government on being open to criticism.

It is also hard for local media to get rid of the notoriety garnered in times of conflict. During the conflict, the media is generally used as a mouthpiece of the warlords or faction leaders making the media aggressive, partisan, and polarized and subsequently making the society less tolerant and less democratic. The impartial media members, or those on the opposing side, are commonly persecuted and detained by opposite groups or government forces. This makes the belligerent leaders a predominant source of information during the conflict and increases fear of these leaders. Other media are

---

covertly allied with some factions and politicized accordingly. It is not possible for the media to remain unbiased when they have survived a protracted conflict, nor is it possible to report about the conflict without the personal bias and effects of previous events. It is difficult for the local media to overcome the erosion in the public trust after conflict. During the Liberia conflict for example, the media had employed self-censorship due to the fear of warlords and carried out the duty as was dictated by these warlords; consequently, it was difficult in the post-conflict times for the media to regain the trust of the populace.

C. THE ROLE OF MEDIA IN PEACEKEEPING

The media has huge productive and damaging effects over population before, during, and after conflict. Before a conflict, states or belligerent groups largely use the media to exacerbate hatred and increase the cause of war. During the conflict, it can provoke people towards violence: for example, Hitler used the media to create hatred against Jews and homosexuals; Yugoslavian media provoked ethnic groups against each another during the Bosnian War; likewise, Radio Télévision Libre des Milles Collines (RTLM) in Rwanda called people of the majority, the Hutus, to kill the minority, the Tutsis. After the conflict, the media can be used for peace and development goals. Former UN Secretary General, Kofi Annan, best explains its role when he states, “By giving voice and visibility to all people—including and especially the poor, the marginalized, and members of minorities—the media can help remedy the inequalities, the corruption, the ethnic tensions, and the human rights abuses that form the root causes of so many conflicts.” The media can also arouse consciousness about peace and link the peacekeepers to the host nation. As Bratic successfully illustrates, the media has much bigger influence than direct methods that are used in peacekeeping. Mediation and

---

46Hunt, Public Information as a Mission Critical Component of West African Peace Operations, 21
47Bratic and Scrich, Why and when to use the Media for Conflict Prevention and Peacebuilding, 7
negotiation processes can reach two to twenty people; training, twenty to fifty people; and arts-based processes, fifty to one thousand people, but mass media approaches can reach thousands of people.\textsuperscript{49}

Information is power, and in the hands of the UN it can be power for peace.\textsuperscript{50} UN peacekeepers that lack knowledge are often vulnerable, ineffective, and incapable of protecting themselves or the people they are deployed to assist in the peacekeeping process. Information Operations is also one of the elements of power used by the international community’s political and military leaders to shape the operational environment, deter potential conflicts, and resolve crises. The application of IO can be effective and may be expanded in the future. One of the main objectives of Information Operations during peacekeeping is to assist the host country in post-conflict situations while also trying to earn their trust and confidence. However, developing friendships to “win hearts and minds” is unrealistic; history shows us that trust of the United Nations Public Information campaigns during post-conflict re-stabilization is not great around the world. Nevertheless, the Information Operation campaign’s goal of earning the trust and respect of the silent majority is a goal that could be accomplished as trust and respect mobilize action.

“A 2008 United States Institute of Peace review proposed that the media can provide a great number of options in conflict resolution. Some of these options are professional journalism capacity-building; citizen and community-based media development and grass-roots interests; intentional peace-promoting media, particularly using entertainment formats; and advertising, commercial messaging, and other overt attempts to influence public attitudes.”\textsuperscript{51} Using most of these opportunities, the overarching goal of the United Nations IODP is to convince the silent majority of the post-conflict society that their interest contributes to peace and negotiations and not to the

\textsuperscript{49}Bratic and Scrich, \textit{Why and when to use the Media for Conflict Prevention and Peacebuilding}, 25.

\textsuperscript{50}Lindley, \textit{Untapped Power? the Status of UN Information Operations}, 1.

29
conflict. The successful United Nations IODP has always emphasized reporting the truth (good and bad) to the population to establish trust and respect. Informed citizens acting on open source information can make a difference. (Successes and failures of this will be found in case studies.) However, there are challenges that the UN needs to address:

- The UN should avoid being vulnerable to electronic communications and “collection-centric” methods by utilizing a list of requirements to analyze data, definition of requirements, collection management, post-processing, and sense-making. As a matter of fact, in Liberia and Kosovo, the UN was able to make progress in the list of requirements. However, because of limited media access of the UN IODP in Ethiopia, implementing and enforcing these requirements were difficult.

- Understanding how to craft the right IO message requires background information about the culture and social structure. It is not possible to craft or deliver the right message to the right person at the right time in the right context without first understanding tribes, villages, and neighborhoods—in other words, the audience of the message. UN IO officers need to work extensively at developing a friendly and respectable working environment within the population to ensure that the peacekeeping influence becomes a strategic opportunity within the local media. Holistically adapting training efforts on how to gain trust and influence within the indigenous population will enhance UN IODP capabilities to generate actionable intelligence at the lowest possible level across the force. Ongoing training initiatives will empower the UN IODP to obtain and retain knowledge of the culture and background of the indigenous people, and this in turn will provide insight into the basic values and motivations that are more than likely to affect population activity and behavior. Understanding the climate of the conflict requires a deep appreciation of the society in which it occurs. By creating detailed IO strategies and diligently monitoring the population’s disposition within the country through clandestine human intelligence, civil affairs, humanitarian assistance, et cetera, we can significantly improve intelligence and combat spoilers through effective IO.

- In order to keep pace with technological developments, the organizational fogginess must be addressed. Today’s technology enables journalists to broadcast an ongoing incident live (providing they are on the ground). While witnessing an incident, journalists just need to set up a satellite phone to break

---

52 For military and Police in counter insurgency or counter terrorism Frank Kitson groups information into two: first, background information which is strategically and operationally important and second contact information which is tactically important. Once the military or Police have enough background information then they may have develop tactical information in order to engage with the insurgent groups. For more see Frank Kitson, Low Intensity Operations: Subversion, Insurgency, and Peace-keeping. Stackpole Books, 1971 Harrisburg, Pa, GBR Chapter 6 Insurgency Part 1: Tactics: Handling of the Information, 96–101.
the news to their central offices. In a matter of minutes, the news may reach wide international audiences. By comparison, the UN IODP flow of information is much slower. Indeed, faced with the same incident, an officer will report the situation to his immediate higher headquarters. This process will be repeated until the information reaches a high enough level at headquarters where the information can be cleared for public release.53

Providing UN IODP target audiences—international and local media and local population, accurate, information is the key element of success during post-conflict re-stabilization. To provide complete, accurate, and timely information to the media, IODP needs to maintain a rapid information flow and thus be closely tied into conventional operations. Specifically, PI officers need to have close association with their commanders to be kept informed of plans, operations, and incidents as they unfold, and to be allowed to release information quickly to the press. The same understanding should also be established between the PI section and higher authorities for the new trend of two-way interactive communication.

Humanitarian intervention requires decentralization of command and control so that personnel are free to act on their own initiative within broad mission guidelines. Currently UN personnel are over-constrained by the need to ask up the chain of command for permission to act on even relatively routine matters.54 For the local population, immediacy can override accuracy; for the UN IODP, accuracy can override immediacy.

Chapter IV will employ a comparative case study design that examines the United Nations Information Operations during peacekeeping in Kosovo, Liberia, and Eritrea-Ethiopia. These cases were chosen based on the United Nations’ most recent activities in Information Operations and information systems during peacekeeping operations. These cases date between 1999 to the present. Additionally, the United Nations still maintains a presence in all four case studies selected and utilizes Information Operations during Peacekeeping.

These cases will be assessed based on the following criteria:

- One-Way Information Dissemination Versus Two-Way Information Dissemination
- Data Integrity (Accuracy) Versus Data Inaccuracy
- Ability to Disseminate Information Versus Inability to Disseminate Information
- Management Support to Improve Information Systems with Users Versus Nonsupport
- Resource Allocation Versus Lack of Resources for IO Implementation

This thesis acknowledges the existence of several limitations of this design. The conclusions drawn from these cases may not apply or fit similar cases in other parts of the world. There are likely to be variations due to many factors such as the nature of the conflict, its timing, and factors unique to the historical patterns and contextual features. The following empirical observations will be examined accordingly through case studies of IODP that involved information dissemination, resource allocations, population support, and government stability. There is a consensus in the research literature that identifies when UN Public Information campaigns are unsuccessful, and this exists when the following conditions are present:

- A politically rigid host nation where a “pseudo-democracy” is most likely to fail
- An instance where actions do not match the narrative
- An occurrence where a lack of trust develops between the host nation and sponsors

We chose to examine the following empirical observations through case studies of successful or working Public Information campaigns that involved trust and influence through population support, information dissemination, data integrity, and resource allocation. The observations above outline observed empirical patterns from each case.

Although we keep in mind that every post-conflict situation is unique and PI initiatives should address these exclusive features per se, there are also some commonalities and patterns across all post-conflict zones. Besides the reflection of specific contextual features of each country, it is equally prudent to understand these common features and patterns as they are seen in such complications as social structure...
and media texture, hatred between rival groups, poverty, underdevelopment, low literacy rates, and high unemployment rates. For example, after a conflict, the unemployment rates increased in Liberia to eighty-five percent.\textsuperscript{55} Due to many factors that are examined below in the following chapter, the post-conflict environments lack a credible and effective local media to disseminate essential information to population even during an increased need for them.\textsuperscript{56}

The main apparatuses used in PI campaigns are the visual, audio, electronic, and printed media. In order to disseminate information to a targeted audience, newspapers, radio, television, and the Internet are used as the main instruments. Television and the Internet have had superiority in media campaigns due to the visual and entertaining features of the former and the additional speed of the latter. Unlike the European post-conflict environment of Kosovo, radio has been the most predominant channel in the missions in Africa. Therefore in three of our case studies: Kosovo, Liberia, and Eritrea-Ethiopia, radio has been significantly used due to the fact that the literacy levels are still too low in these countries, and rural areas are beyond the coverage of television and internet signals. Big portions of the population in these countries cannot afford to buy TVs nor internet devices and services. Because of such scenarios, UN agencies and other international actors become the main source of advertising revenue for the media outlets in post-conflict countries.\textsuperscript{57} Radio is also effective in means of advertising because it holds less advertising cost compared to those of television and newspapers.

Another aspect of the usage of media in peacekeeping is that the peace processes comprise the serious job of news programming and public awareness campaigns. In order to overcome the shortcomings of these tasks, it is possible, as well as necessary, to make it enjoyable to the audience. As Howard puts it, the usage of media in peacekeeping should not be confined into traditional areas but rather should extend into entertaining

\textsuperscript{55}\textsuperscript{Hunt, Public Information as a Mission Critical Component of West African Peace Operations, 23 56}\textsuperscript{Ibid., 24 57}\textsuperscript{Ibid., 22}

33
avenues of the media like popular music, soap operas, live radio or television programs with call-ins, concerts, and street theaters.58

It is also equally important to cause no harm to the weak and vulnerable local media. The efficiency and impartiality of the Public Information campaigns enable them to reach their goals; however, this also causes a bad effect over the local media institutions. The UN radio programming in particular tends to be the favorite media channel among local populations and therefore decreases the popularity and revenue of the local contenders. Since the mission is there to cause no harm to local institutions, and is not permanent in the area, the competition against local counterparts should be balanced. There should also be an exit strategy in order to ensure that there will be no deprivation in the media texture when the mission is shut down. Media outlets such as mission radio stations should therefore not be in a hurry to air an end-of-broadcast.

58Howard, An Operational Framework for Media and Peacebuilding, 9
IV. PUBLIC INFORMATION CAMPAIGNS IN KOSOVO, LIBERIA, AND ERITREA-ETHIOPIA

A. CASE BACKGROUND AND EXAMINATION OF THE UN APPLICATION OF INFORMATION OPERATIONS FOR INFORMATION DISSEMINATION IN IODP CASE STUDIES

Chapter IV discusses a number of challenges identified as needing consideration by the UN IODP. This chapter will report the key findings from efforts made to understand the informational needs within three case studies regarding information and influence operations in UN Public Information campaigns. This overview of the UN IODP, based largely on secondary sources, points to several fundamental, overlapping themes. First, inadequate information on the local population and culture, that is the lack of a proper analysis of the target audience, proved to be one of the greatest obstacles to effective influence operations efforts. This lack of sufficient information led to bland messages that did not resonate with specific target audiences and made it difficult to compete with adversaries more capable of exploiting the local information environment. Second, in addition to the obvious socio-political and cultural differences among the cases, there is a difference in the attitudes of the target populations. In Kosovo and Liberia, the local populations were considerably more favorable and open minded toward the UN IODP and thus more receptive to their messages than was the population in Ethiopia. Third, the goodwill of a population can easily dry up in the absence of tangible progress in such areas as reconstruction and security. The UN IODP had a smaller margin of error in Ethiopia than it did in Kosovo and Liberia, making the influence operations effort in Ethiopia considerably more challenging.

Current UN IO doctrine could be improved by underscoring the contribution that Information Operations provide in the building of trust and influence, the importance of integrating Information Operations within all levels of conventional operations, and in the influencing of a population’s belief for or against disinformation from the adversary. In short, this chapter highlights the important role that information operations played in the UN’s PI campaigns in Kosovo, Liberia, and Eritrea-Ethiopia.
UN IODP efforts during these three case studies significantly helped—and occasionally hurt—population support for the peace process. Information operations can have the same impact for today’s UN IODP if the lessons of the past are applied. As it was done in Cambodia and Liberia, the context sensitivity should be handled with care. The social and media context should be appraised in the planning phase in order to understand the audience and program an effective PI strategy.\(^5\)

The dilemma of media impartiality and peace reporting is a very important challenge in IODP. Ethically, media is supposed to be free, honest, and impartial, and therefore needs to report both sides of the story. However, it is almost impossible for UN media tools to criticize the UN or highlight the downsides of peacekeeping activities if there are any. Nor, is it realistic to expect a UN media tool to take the side of a spoiler party, even in the case that the party is right in that subject. In fact, these operations logically intend to stimulate a psychological effect within the population to jump start a positive belief in the population and improve it. In other words, the media is used as a tool and information as a tactic. As the belief in peace and trust in peacekeepers increases in the hearts and minds of the people, it will progressively increase the belief in the success of peace. Once a majority of the people believes that the peace process will succeed, it will have a snowball effect over the popular support towards peacekeeping which the UN certainly needs. However, the divide between impartiality and selective reporting should be balanced, and persuasiveness of the UN and its media tools should be maintained. If the IODP exaggerates praising UN activities, it may lose persuasiveness, and people may begin thinking that the broadcast is unrealistic. Therefore, the UN’s organizational sensitivity towards ethics, impartiality, democracy, equality, non-discrimination, and human rights and freedoms should be demonstrated in all aspects of the PI campaigns.

These case studies will examine the role of Information Operation campaigns in Kosovo, Liberia, and Ethiopia-Eritrea, and the tools they used to deploy their messages. Additionally, these case studies will focus on their public outreach strategies utilizing

\(^{59}\)Hunt, *Public Information as a Mission Critical Component of West African Peace Operations*, 29
radio and television outlets. This chapter will reflect on the strengths and weaknesses of the Public Information campaigns and Information Operations within the respective case studies, evaluate the communication tolls and strategies that were employed, and make recommendations for improvement.

An effective Public Information campaign can incorporate this knowledge about the population into actions and develop methods and tactics to appeal to or satisfy any number of the Hierarchy of Needs influencing individuals in order to succeed IODP. This is not easy by any stretch of the imagination. When looking at the potential target audience’s needs, IODP must consider and understand the environment and culture. Understanding human dimension goes far beyond cultural awareness and leads to understanding values and norms. The difficulties associated with using the Hierarchy of Needs within Information Operations are not insurmountable, and the Public Information campaign that recognizes and satisfies these needs is the one most likely to gain significant influence over the population.

B. HIERARCHY OF NEEDS REVISITED

This section will explore several factors that lead to the conclusion of the importance and relevance of the Hierarchy of Needs as an Information Operations tactic: the nature of Public Information campaigns in peacekeeping, social and media context in post-conflict zones, and the technology used to convey messages. People create theories and models about most everything—it helps individuals understand. For example, Maslow's Hierarchy of Needs helps to explain how a human being’s needs motivate him. Similar to Maslow’s Hierarchy of Needs the Information Operations’ pyramid highlighted in Figure shows that it is important to take IO into account when examining the needs, desires, and wants of a target audience. The number one rule in Information Operations is to engage with people; this is how one moves up the pyramid. It takes time and effort but can pay off in return.

Maslow's Hierarchy of Needs states that one must satisfy each need in turn starting with the first, which deals with the most obvious needs for survival itself. Only when the lower order needs of physical and emotional well-being are satisfied are we
concerned with the higher order needs of influence and personal development. Conversely, if the things that satisfy an individual’s lower order needs are swept away, they are no longer concerned about the maintenance of their higher order needs. All human beings have social needs, and to have a good, successful, happy life, one needs to socialize with others and feel part of a network. Because humans are by nature social beings, it is good for them to live in a society in which the social life is mostly based on a community or social network. For this reason Aristotle espouses that social life in a community is a necessity for an individual’s complete flourishing as a human being.60

One of the most difficult things for people to do is give up control and relinquish “power” to the masses unless they can see tangible gains. It is the single largest barrier to accepting and adopting a process that is different to one an individual has been conditioned to use. Such is the case for the following case studies: Kosovo, Liberia, and Eritrea-Ethiopia. All three missions faced problems and successes when applying the Hierarchy of Needs through an Information Operations application and analysis.

C. THE KOSOVO CONFLICT:

Tensions between the Serbian and Albanian communities in Kosovo simmered throughout the twentieth century and occasionally erupted into major violence, particularly during the First Balkan War, World War I, and World War II. During the winter of 1999, the ensuing war for Kosovo was telecast around the world, with millions of people watching the conflict in real time.

Information Operations played a key role in the Kosovo crisis, since, as a precondition, the entire Balkan region was plagued by religious and ethnic turmoil. The intense emotions that were systemic there created new challenges for the forces that were attempting to develop peace and stability. The key messages that emerged in the subsequent IO campaign suggested that the only way to a better future for the inhabitants of the region was through tolerance and cooperation and that the combined strength of the

---

community was greater than its parts. Information Operations themes aimed to reinforce the idea that tolerance and cooperation meant a better standard of living and a safer future for everyone.\textsuperscript{61}

If a state loses its ability to regulate an ethnic conflict, the problem becomes a structural security dilemma because it could invite external intervention. Thus ethnic conflict poses a security dilemma along two dimensions: States which act out with aggressive behavior as a consequence of internal cleavages and transnational ethnic affinities; and States in which internal weakness leads to efforts to avoid external involvement. The result is a de-legitimization of the State authority and an opening in the political process for opposing factions. This was the case in Kosovo, prior to United Nations intervention.

On September 23, 1998, acting under Chapter VII of the United Nations Charter, the UN Security Council adopted Resolution 1199 demanding that all parties in Kosovo and the Federal Republic of Yugoslavia (Serbia and Montenegro) cease hostilities and maintain a ceasefire. The UN Interim Mission in Kosovo (UNMIK) was faced with the absence of an effective, central government. Without State institutions, Kosovo’s two primary ethnic groups were Albanians and Serbs.\textsuperscript{62}

Extremist elements frequently used the friction created along such fault lines to instigate interethnic violence and to threaten Kosovo’s fragile peace. The irreconcilable differences between these two societies affected every aspect of UNMIK’s civilian missions. To influence the populace, the UNMIK had to influence Albanian and Serb organizations and the individuals and groups within them. This was accomplished through proper information dissemination, data integrity, improvement and protection of information systems, and proper resource allocation.

\textsuperscript{62}Siegel, 1997.
1. **Hierarchy of Needs**

The system of human needs from bottom to top—shelter, safety, leadership, community, competence and trust—are dependent on one’s ability to connect with others. Belonging to a community provides the sense of security and agency which fosters happiness and helps one feel safe; belonging is the driving force of human behavior. Sometimes the desire for safety outweighs the desire to easily satisfy physiological needs. For example, during the Kosovo War, many residents of Kosovo chose to inhabit a secure area instead of an insecure area, the latter having more definite access to food. For example, Maslow says:

Assured safety permits higher needs and impulses to emerge and to grow towards mastery. To endanger safety, means regression backward to the more basic foundation. What this means is that in the choice between giving up safety or giving up growth, safety will ordinarily win out. Safety needs are proponent over growth needs…In general, only a child who feels safe dares to grow forward healthily. His safety needs must be gratified. He can't be pushed ahead, because ungratified safety needs will remain forever underground, always calling for satisfaction…

2. **Operating Environment**

The mandate of the United Nations Interim Administration Mission in Kosovo (UNMIK) was established by the Security Council in its resolution 1244 (1999). The Mission is mandated to help ensure conditions for a peaceful and normal life for all inhabitants of Kosovo and advance regional stability in the western Balkans. The Mission is headed by the Special Representative of the Secretary-General, who enjoys civilian executive power as vested in him by the Security Council in resolution 1244 (1999). The Special Representative ensures a coordinated approach by the international civil presence operating under UNSC resolution 1244, including the Organization for Security and Cooperation in Europe (OSCE), which retains the status of UNMIK's pillar for institution building. The Special Representative also ensures coordination with the head of the European Union Rule of Law Mission in Kosovo (EULEX), which has operational

---

responsibility in the area of rule of law. EULEX is deployed under Security Council Resolution 1244 (1999) and operates under the overall authority of the United Nations.\textsuperscript{64}

State media played an important role in the Kosovo conflict. Earlier, throughout Yugoslavia media was a powerful tool in the hands of the regime to control the public opinion. Only in very few regions were there independent media operating. Therefore, their influence could not have been compared to the influence of state-owned media.\textsuperscript{65}

3. Information Dissemination

To understand Information Operations in a mission, it is useful to have a general grasp of the media situation in that country. Likewise in order to understand the role of UNMIK in the context of Kosovo, it is beneficial to understand what authority granted by the mission mandate to UNMIK in regard to the establishment of a free and independent local media, and to ensure a secure environment for all residents. Until the early 1990s there was no Albanian broadcaster in Kosovo’s media sector: the Serbian government strictly limited broadcast to the authorities in Belgrade and the broadcasts made from the Serbian government in Belgrade had little credibility with the Kosovo Albanian population. Therefore, satellite television proved to be an innovative way to translate messages to the Albanian population. In 1993, Albanian radio stations Koha and Radio 21 were permitted to broadcast. After the signing of UN Resolution 1244 media outlets were permitted to restart under the Resolution which established UNMIK and gave the mission legislative and executive authority in Kosovo.\textsuperscript{66} Under this resolution UNMIK was able to use Radio Television Priština (RTP), the largest State-run media outlet in Kosovo, for Information Operations campaigns.

Even in the early phases of the intervention, the need for information was undertaken in Kosovo. Media Action International, an international NGO, provided humanitarian information to the people of Kosovo, Albania, and Bosnia during the

\textsuperscript{64}Siegel, 1997.

NATO campaigns.\textsuperscript{67} In this media intervention, radio was used as the most practical and
cost effective media tool; wind-up radios were delivered to the people of the refugee
camps. This helped people stay connected to the information provided by humanitarian
actors even when they lacked electricity in the refugee camps and homes.

Led by the international team, daily television programming was also developed.
Programs were initially aired only two hours a day on satellite television. The BBC
provided staff training and equipment to the station RTP, and UNMIK’s television unit
contributed a five to seven minute news round-up broadcast twice a day in Albanian and
twice a week in Serbian. UNMIK’s daily news broadcasts continued for one and a half
years.\textsuperscript{68} As the second network of the RTP, Radio Blue Sky was established by
UNMIK.\textsuperscript{69} In order to address the urgent information needs of the local population,
Radio Blue Sky broadcasted in Albanian, Serbian, and Turkish enabling open dialogue
and democratic discussions within and between these local groups. By the end of 2001,
the management of Radio Television Priština had completely transitioned to the local
population.

The Kosovo crisis also presented a new challenge for Information Operations
campaigns. This was the first war broadcast on the Internet and preliminary judgments
were that the Serbs completely outwitted UN PI on this new communications technology.
They not only used e-mail containing macro-viruses to disrupt PI computers as part of
their information warfare, but they also used the Internet to refute UN Information
Operations campaigns to get their own arguments across when these were not being
covered by the Western media. For example, the UN IODP encountered several groups
that were resistant to PI campaigns, and therefore the leaders of UNMIK failed. These
spoilers wanted to undermine the security environment, and they largely used word of
mouth to achieve this aim. Specifically, they spread rumors about UN operations causing
civilian casualties and greatly exaggerated local conflicts in order to undercut the feeling

\textsuperscript{67}Howard, \textit{An Operational Framework for Media and Peacebuilding}, 18.
\textsuperscript{68}Loewenberg Shira, United Nations Media Strategy:Recommendations for Improvement in
\textsuperscript{69}Howard, \textit{An Operational Framework for Media and Peacebuilding}, 17.
of safety in the region. As Siegel states, “When someone talks to you for 24 hours about intolerance, about how Serbs and Albanians are different, and how they jeopardize each other...then at the end you start believing it.”

Accurate information on the local situation is vital to the success of both humanitarian and military missions. Charged with rebuilding and/or creating civil institutions ranging from the police to a working government, UNMIK oversaw activities by the European Union (EU) and the Organization for Security and Cooperation in Europe (OSCE). Although the intervention restored order, saved lives, and muddled through; poor coordination, overlapping jurisdiction, and gaps in authority created serious problems.

Modern technology, in this scenario, increased the range, effectiveness, productivity, and success of the UN IODP. Therefore, Kosovo serves as an example of lessons learned in policy and Information Operations coupled with the successes and shortfalls within the Balkan peacekeeping effort.

4. Two-Way Information Dissemination

Two-way information dissemination in Kosovo took place on several platforms, for example, print media, electronic media in the forms of radio and television, and the Internet. The UNMIK website worked as a form of two-way information dissemination. This is because the web is a highly cost effective medium of dissemination from the point of view of an organization. From the users’ perspective, access to the information UNMIK provided on their website produced quick information. This was important especially when quick interaction with UNMIK was necessary. Additionally, the UN IODP was able to access private newspapers and television channels, attend citizens’ hall meetings, and assist in the development and execution of cultural events—all forums in which they took the opportunity to communicate with the local population. However, the

70 Putkin, Katerina, Exploring the Serbian Implicit Culture Inrelation to Kosovo:Thoughts and Experiences of Young Adults from Kosovo and Serbia [Report]. Schelleingasse, Austria : European University Center for Peace Studies (EPU), 2005.

UN IODP was not always particularly effective in getting support from the local population. For example, public authorities, particularly at the local level, saw the UN IODP communication as a way to disseminate and diffuse information through a traditional media approach. There is much to do to transform communication from a one-way dissemination tool to an instrument for two-way interaction. For the UN IODP to be successful, more meaningful engagement had to take place among actors at all levels, both local and international. Establishing relationships based on trust was and still is essential. A key aspect of building trust was for the local population to break from the past and use communication to engage in a consultative dialogue. The UN IODP was able to partially combat State media propaganda by utilizing private and independent media outlets and the Internet in the larger areas in Kosovo. With the increased usage of e-mail and the Internet throughout the war, the UN IODP was able to utilize social media to spread their message. For example, the UN IODP was able to spread their message of enforcing and supporting democratic, fair and non-discriminating mandates, laws, and rules through embracing and enjoying all cultures, races, and individual styles. The Information Operations campaign’s primary contribution to mission accomplishment lay in the continued support for or neutrality toward UNMIK-led operations in the contributing nations. Throughout operations, international and national public opinions showed either support or neutrality toward the mission. No major political controversy emerged at the government level either between the executive and legislative bodies or the government and political activists during the accomplishment of UNMIK.

Internal coordination enabled the Command to send a unified message, made it less likely that different staffs would develop divergent plans, and facilitated the integration of the Information Operations campaign with other tools in the commander’s arsenal. UNMIK’s key task in northern Kosovo remains engaging with and mediating between these communities, as well as serving as a bridge between northern Kosovo and the Pristina authorities. In a peace support operation, where the outside force does not
conduct combat operations, the leader has to place a greater reliance on non-lethal weapons. While every unit has some capability in this realm, PI and PSYOP are two critical, non-lethal weapons.72

5. Resource Allocation

Information has played a critical role in the success of the operations in Kosovo. As in any military endeavor, public support is central to mission accomplishment and the Public Information campaign was tasked with gaining and maintaining broad understanding for the IODP mission. However, there were problems with how each coalition member viewed information dissemination. Even the three major contributors—the United States, the United Kingdom, and France—had different approaches to PI operations. One set of problems arose from different views on the amount of information that should be released to the media. At times the various organizations within the UN did not effectively understand their operational environment, which resulted in an inability to secure the population as the Public Information campaigns were unable to effectively influence change. A properly executed PI not only links one’s deeds and actions with words, but it also is a must for an entity to influence both its desired and unintended demographics. This should be done simultaneously or sometimes sequentially in order to effectively maximize the power of influence among the direct and indirect target audiences.

D. THE LIBERIA CONFLICT

The United Nations Mission in Liberia (UNMIL) was authorized on September 19, 2003. Tasked with a big mandate, including implementing a ceasefire, supporting humanitarian activities, observing human right issues, and reforming national security and police, UNMIL needed to have an effective PI campaign. The PI section of the mission found a degraded local media with untrained employees, inaccessible rural areas, and a climate of illiteracy and rumors.73 Therefore, the PI section ran capacity-building

---

activities including wide range training programs in order to develop a more informed, disciplined, and ethically sensitive media.

Because the sensitive political background of post-conflict zones requires a more sensitive and flexible approach, UNMIL was founded as a civilian-led mission which has been a new trend in contemporary UN missions\textsuperscript{74}. This understanding had positive effects on PI approaches too. The new developments also revealed the fact that intelligence and information-handling approaches in PI operations require more coordination and information-sharing approaches while lessening the need for secrecy and information security.

The mission was welcomed by the parties of the conflict as well as the people. However after suffering a long-term conflict and without knowing whom to trust, it was not easy for the community that was vulnerable to be affected by rumors and false information. Therefore one of the primary jobs of the PI campaign in Liberia was to protect the mission from these rumors and unjustified criticism and address the confusion in the minds of the population.\textsuperscript{75}UNMIL media monitoring units worked as an early warning system for all levels of humanitarian workers and kept them informed about the daily developments in the country. They monitored and analyzed the local and international media, provided outlined information about the external perception of the UN, and facilitated mission peace processes and regional security issues.\textsuperscript{76} Therefore, well informed about the propaganda of media spoilers and bad publicity, the decision-making mechanisms in Liberia earned time to rapidly respond in order to counter the potential bad effects within the population.

The media-monitoring unit also interpreted the feedback from the population on how they perceived and were affected by the mission activities such as elections and DDRR programs. This allowed the mission leaders to maintain and update their activities and strategies in accordance with requirements and security needs of the all the

---

\textsuperscript{74}Hunt, \textit{Public Information as a Mission Critical Component of West African Peace Operations}, 29.

\textsuperscript{75}Ibid., 35.

\textsuperscript{76}Ibid.
employees since the perceptions of the mission by the local population were also a security issue for mission personnel and assets.77

1. Hierarchy of Needs

As Maslow espoused in his Hierarchy of Needs theory, the instinctive need of humans to make the most of their unique abilities cannot come into play until their basic physiological needs are met. In Liberia, basic needs such as clean water, food, and proper living conditions were not being met. Unlike Kosovo, where it was possible to give up freedom for security and food, Liberians had neither option. Poverty is one of the most common problems in post-conflict countries, and economic deprivations impose a lot of limitations on the media industry as it does on almost every other aspect of daily life. The poverty of the people and the State decreases the main revenues of the media that derive from advertising and sales. Furthermore crooked politics also have had bad consequences on the media. In Liberia, local advertisers generally avoid nonpartisan media because of the fear from incumbent authorities.78 This undermines the ethos of the media and favors the big international actors who can easily transcend local economic problems while disregarding the potential repercussions from the government.

2. Operating Environment

In Liberia, literacy rates are very low, which keeps radio as still the most predominant source of PI campaigns. After a conflict, the Liberian illiteracy rates in adults reached its peak in 2006 with eighty percent.79 Another reason for radio to be the most popular form of media is that most Liberian people cannot afford to buy televisions and computers; the infrastructure for radio requires less time and funds, and the electricity grid is not developed enough to provide twenty-four hour electricity in the most rural parts. Television and Internet usage in Africa are confined to the people who are in the coverage range, which generally means the capitols and big cities, while the newspapers are confined to the literate people and their friends and families to whom

77Hunt, Public Information as a Mission Critical Component of West African Peace Operations, 36.
78Ibid., 18.
79Ibid., 6.
they read the newspapers aloud or summarize the news they read. In addition, the newspapers cannot reach large populations within the continent. Although radio is the most convenient media tool in African countries and there are numerous private and governmental radio stations throughout the region, the radio broadcasting has a lot of shortcomings. In most of the African countries, the local radio channels face a lack of proficiency in journalism and programming, successful transmission capabilities, and effective infrastructure, not to mention interference from the local governments.

In Liberia, people do not trust the local media. Due to problems such as a lack of proficiency, sensational reporting, bad image in public memory of media from the conflict years, and bad quality of local media work, the Liberian people present more trust towards international media. Therefore, in Liberia, international news authorities such as CNN, al Jazeera, and BBC are perceived to be more honest and trustworthy. This further increases the leverage of the international media and decreases the leverage of local Liberian media in the role of being a means of democratic checks and balances over the local governments.80

Rural community radio stations were an exception to this. Given the ability to run on small budgets and considering the low literacy rates in the country, Liberian rural community radio earned the trust of the communities they serve. Belonging to rural community groups, running for the benefits of these groups, operating on tiny budgets, and covering the issues that are discounted by commercial and State radios, these types of media outlets seemed to be worthy of support by UNMIL. As Myer states, even though this type of broadcast required fewer funds, they were still in need of support by international actors.81

Due to the abovementioned deficits in television and the press, these sectors are generally underdeveloped in Liberia. The newspapers and magazines are lacking quality content. Some of the publications can only be published when they can find enough

80Hunt, Public Information as a Mission Critical Component of West African Peace Operations, 20,
81Myers, Voices from Villages: Community Radio in the Developing World, 10.
advertising for each edition. Furthermore, the culture of sharing one newspaper among several people reduces the potential of income, albeit its increase in audience. As for local TV broadcasting, despite this tool having the potential to better influence the audience with its audio-visual presentation, the sector remains immature due to the limited coverage, audience, and lack of technology and competition.

Having less effect over government, less outreach in the population, and little hope and capacity to recover, the local media in a country has a tendency to go for soft journalism. The local government and other internal actors seem incapable to address these problems; thus UNMIL PI sections adopted a solid capacity-building strategy for the local media. This strategy included advertisement giving, training, editing, auditing, and direct logistical support.

Fortunately video clubs emerged in this country, and the PI section successfully utilized this opportunity in means of disseminating the message of the mission to the population as well as having feedback from the population. The peacekeepers watched movies, news programs, and even football matches with the local people; they drank tea with them and had friendly chats after the show. This let the locals think more about the peace and negotiations. After earning their trust and becoming familiar with them, the PI section brought their own short footage videos and sometimes merged these presentations with interactive discussions.

3. Information Dissemination

It was difficult for the local media to overcome the erosion in public trust after the conflict. Therefore, it was a necessity for UNMIL to start disseminating information by direct means such as UN radio broadcasts, posters, advertisements, and fliers. As the capacity-building activities continued, the PI section also began utilizing local media means.

---

83 Video clubs were not invented by UN officers; they were a local solution to the shortcomings of owning a TV and lacking TV infrastructure. Some local entrepreneurs run some shops mostly in shape of a tent and provide satellite TV broadcast, video and DVD shows and soft beverages to the customers.

The most effective needs were utilized in Liberia. For example, although mass communication is very crucial in Liberia, it was found that the most effective way to communicate was through face-to-face communication, as Hunt asserted citing the former UNMIL chief military PIO.\textsuperscript{85} Formal media channels such as press releases and media conferences were able to reach the journalists in the local and international media but sometimes failed to reach a large portion of the targeted local population who were beyond the coverage of specific forms of media. Therefore, this context required creative and innovative methods for message dissemination and peace propaganda.\textsuperscript{86}

A culture steeped in the oral tradition is another peculiar feature in Liberia where people of rural areas share the media information with family, friends, and neighbors. Due to the lack of a comprehensive media, only through oral dissemination can the information find the way through these informal networks throughout the rural areas.\textsuperscript{87} These channels also spread mistrust and manipulated information, thus jeopardizing the venerable peace processes. This makes the context more complicated in peacekeeping environments. However, in Liberia, the UNMIL PI section managed to utilize these channels in favor of peace and mission objectives. Friendly meetings with significant local groups increased the public support towards the mission. The peacekeepers also appreciated the importance of face-to-face communication in the local culture and utilized this in addressing the need for peace as well.

In order to optimize PI activities, it is important for a mission to understand the causes of its success and failure. Therefore, it is essential to ensure that its PI is positively affecting the peace process and is perceived positively by the target audience, even though it is difficult in peacekeeping to measure the success of the PI. In post-conflict environments like Liberia, even the most basic indicators are not available, such as listener and readership figures. It is equally difficult to infer qualitative or quantitative results from behavioral change within the audience or a measurement of the intended outcome. When there is no feedback from the audience, the UN PI carries on its

\textsuperscript{86}Ibid.
\textsuperscript{87}Ibid., 17.
activities, supposing that its strategies and tactics work and that the audience is receiving the message. Although the PI have some beneficial effects which yield quantitative inference through the mission activities, the numbers of ex-combatants disarmed during Demobilization Disarmament Reintegration and Resettlement (DDRR) campaigns, and the voter participation in presidential elections, it is still almost impossible to distinguish the PI effect from other independent variables. Therefore, UNMIL’s Media and External Relations Unit provided up to date information to the media, arranged meetings of the mission leaders with the media representatives within both the mission office blocks and media structures, and provided access to the media of the mission personnel in rural areas including transportation and security.

As mentioned above, the Liberia mission was the first mission to have a PI section as an integrated part of the mission from the planning phase on. The PI personnel were sent to the mission area ahead of the mission and planned an optimum PI strategy after evaluating the social and media background of the country. They managed a very effective PI campaign from the first day of the mission and launched UNMIL Radio’s broadcast immediately. This media savvy approach made a revolutionary change in peacekeeping and in PI.88 They changed the primary target of the PI campaigns from the international community and media to the local populations as well as the PI method from one-way information dissemination to two-way interactive communications.

UNMIL’s radio broadcasting has been perhaps the most effective tool in PI in Liberia. As described earlier, given the high illiteracy and poverty rates, lack of access to other media types, and radio’s technical advantage for infrastructure and coverage, radio became the principal medium to disseminate information over a large geographical space in Liberia like most of the African countries.89 The radio broadcast started in the inception of the mission and surpassed the coverage of the local radios that were confined to FM. Beyond the dissemination of propaganda, radio also provided reliable and realistic information for the refugees and IDPs about the security situation and other conditions

---

89Ibid., 37.
back in their home regions and thus helped them decide when to return.\footnote{Hunt, \textit{Public Information as a Mission Critical Component of West African Peace Operations}, 40.} This was a significant development in means of helping the activities of the United Nations High Commissioner for Refugees (UNHCR).

The Publications and Print Unit used published posters, stickers, fliers, brochures, newsletters, and newspapers and helped local newspapers with editing and other activities in order to disseminate the mission’s communication to the local population. Although these activities seemed to be limited to literate people and some of the territories were not reachable because of non-UN friendly control by belligerent groups, the sharing culture, and reading out loud to those illiterate, the discussion of news among family, friends, and neighbors increased the coverage of information disseminated.\footnote{Ibid., 46.} These products were also important as means of providing ostensible evidences of the existence of the mission as well as its activities. The unit also launched the UNMIL website in order the reach Internet users inside and out of Liberia. Furthermore, UNMIL produced region specific publications.

UNMIL’s efforts were also supported by some NGOs. Search for Common Grounds, an international NGO ran a media campaign named Talking Drum Studio Liberia for local newspapers and radio stations. These programs included not only serious news and informational programs but also entertaining programs such as radio dramas, social discussion programs, and children’s programming.\footnote{Howard, \textit{An Operational Framework for Media and Peacebuilding}, 18.} All of these programs aimed at reducing conflict and violence and increasing awareness towards reconciliation, peace, and democratization.

4. **Two-Way Information Dissemination**

The UNMIL Radio was able to address the demand in the market for information in an effective interactive way that the people of Liberia straightforwardly noticed as working. UNMIL Radio led the audience to call the live radio programs and enabled them to ask questions, make recommendations, and request songs. This enabled the locals
to have more fun, get more involved in UN activities, and it increased the communication between the peacekeepers and the local audience. Besides this direct feedback, the officers in the field also made surveys during the meetings and conversations with locals. All this direct and indirect feedback was collected, evaluated, and used in order to update and modify the broadcast strategies. This appropriation coupled with the integration of all mission proponents, provided a platform to various actors to disseminate their message. The radio used several local languages as well as official dialects to increase coverage and the rapport between broadcaster and audience.

The UNMIL PI section has not only been the voice of the UN mission and other UN agencies but also has enabled these actors to better understand the local population as well as their perception of peace operations. The PI and most particularly UNMIL Radio have been delivering all of the messages for the whole UN community in line with the mission objectives, and they have helped the mission maintain currency, coherency, and credibility.93 The PI section also has been effective addressing the challenges of cooperation between UN civil, military, and police sections and has made sure none of these components deviate from the main path. The PI sections of military, police and civil sections of the mission managed to collaborate and overcome the adaptation of the military information sections from secrecy and opacity to transparency and information sharing.94 The vertical administration lines and the lateral, mostly horizontal, lines of PI activities were arranged and also somehow integrated. Signals managed to reach almost all the rural populations and approximately ninety-five percent of the Liberian territory.95 These signals somehow exceeded the territories in Liberia, and the UNMIL PI section maintained the UN’s key share as the main advertiser in the media.

In order to reach the community levels that the transitional media could not reach effectively, the Community Outreach (CO) unit ran awareness-raising activities in theatres, music shows, concerts, dance shows, quiz competitions, high school competitions, as well as peace and reconciliation football tournaments which worked to

94Ibid.
95Ibid., 39.
bring different groups, such as ex-combatants, together peacefully. The advertisement of these activities was done with posters, key rings, t-shirts, and text messages to mobile phones. In 2006, the Community Outreach Unit organized a mobile phone texting campaign in order to increase awareness of gender-based violence, and according to Hunt, it reached 500,000 people out of a population of three million Liberians.\footnote{Hunt, \textit{Public Information as a Mission Critical Component of West African Peace Operations}, 43.}

The Media Monitoring Unit also kept an eye on the developments in the field and on the rapid development team in order to respond to the specific developments in particular regions. Wherever a kind of crime or conflict relapsed or other issues arose, the CO Unit was sent there to increase awareness about that particular problem.\footnote{Ibid.} These activities of the CO unit put a human face to the activities of the PI, developed very good relationships with local groups and their leaders, and ultimately built a network of trust comprising of peacekeepers, NGOs, and civil society.\footnote{Ibid.} This was very beneficial, particularly in the areas where the mission wanted the civil society to get involved in order to avoid being perceived as prescribing things from outside.

The aforementioned informal networks that used the word-of-mouth communication in Liberian communities were utilized, and the information desired was rapidly disseminated throughout the targeted population. Also, these activities utilized the face-to-face communicating culture of Liberia. These interactions ultimately helped the civil society increase its bonds inside the informal lines and networks of the society. These communications with the civil society did not only involve two-way communication but also provided a real feedback from the forums of societal groups at the grass roots level. Overall these good relationships with the society contributed to the general mission’s success, putting the PI section in the frontline to steer the political process, which is the core of the mission.\footnote{Ibid., 44.}

Misunderstandings were avoided by the PI campaigns in sensitive areas such as presidential elections. For example, in order to project impartiality during the elections,
all football and text messaging activities were postponed because one of the candidates was a formal football player while the other one tried to come forward by using text messages. Use of these messages could be misunderstood or manipulated as if there was an affiliation with one of the candidates.\textsuperscript{100} The CO unit also helped the television and video unit to produce and deliver video programs for video clubs and stimulated discussion after these video shows. Some of the CO Officers watched Nigerian movies and football matches with local people and stimulated some discussions, finally driving the conversation toward the peace processes.\textsuperscript{101}

5. Resource Allocation

The local media in post-conflict countries are generally dependent on external funds. Since assistance from outsiders is generally motivated by political gains or self-interests, they spoil the moral structure of the media. Most of the media workers in these countries are novices since a number of professional media members leave the country during the conflict, which increases the need for training. These problems compromise the integrity and credibility of media in the eyes of people.

To overcome these kinds of shortcomings in Liberia, the UNMIL PI section always supported the local media. The PI section continued to be the biggest source of income for Liberian local media with six-month terms of contracts for advertising. In a time that is very critical for the media institutions to survive, this has been a temporary but vital solution for the struggling media in Liberia.

In order to avoid misperceptions, UNMIL decided to give advertisements to the local media institutions with no discrimination against political orientation or level of professionalism, but this was criticized for providing help to wrong and undeserving parties. The UN assisted the Liberian government in their information campaigns that focused on investment in land development by providing jobs to former child soldiers, reconstruction, and aid assistance. For example, former child soldiers were trained while on the job in order to assist in building schools, farming, land cultivation, and carpentry.

\textsuperscript{101}Ibid., 46
E. THE ERITREA-ETHIOPIA CONFLICT

The UN IODP campaign in Ethiopia suffered setbacks because the State hindered the UN’s operations including Information Operations campaigns. UN operations lasted from 2000 until 2008. The UN eventually had to pull out because the State made delivery of aid products almost impossible and endangered the lives of UN personnel. Although UN operations in this country were moderately successful, it is still considered a failure in case studies of the implementation of good standards of the UN IODP. For example, the Ethiopian government accused the UN Mission in Ethiopia and Eritrea (UNMEE) of “leaking stories” to the media, saying this could undermine confidence in the peacekeeping process. The Ethiopian government accused UNMEE of giving details of a serious confrontation between armed Ethiopian militia and Indian peacekeepers. UNMEE lodged an official protest after armed Ethiopian militia illegally entered the Temporary Security Zone (TSZ) and threatened peacekeepers:

[An] Ethiopian foreign ministry statement said that details of the incidents earlier this month provided by UNMEE to journalists had been ‘distorted, selective half-truths’. ‘One would have thought that UNMEE, as the custodian of peace between Ethiopia and Eritrea, for now would be discreet in its behavior and that it would, as much as possible, shun controversy with the parties, in public,’ the statement said. It said by ‘cozying up’ to journalists, UNMEE had undermined its peacekeeping role and was acting like ‘politicians running for office.’

IODP were hindered in Ethiopia, but they were able to run some campaigns on State radio and television with State permission through outreach centers. These centers, which were established in 2002 as an official outlet for print, radio, and video materials about UNMEE and the United Nations, helped to keep local populations informed of UNMEE’s work to facilitate peace between Ethiopia and Eritrea. Outreach Centers in Asmara and Barentu, Eritrea, were closed in 2003, at the request of the government. Additionally, the State of Eritrea hindered all aspects of the UN IODP.

---

The peacekeeping mission in Ethiopia (UNMEE) was a UN mission operated to solve the issues between the two nations after two years of fighting in a border dispute. The mission was mandated to maintain a liaison with the parties and establish a mechanism for verifying the ceasefire. During the operation, the peacekeepers maintained commonplace IODP activities to support peacekeeping operations. However, in July 30, 2008, the mission was terminated by the Security Council as a response to “crippling limitations” levied by the Eritrean Government.\textsuperscript{104} The Public Information section was a main component of the mission besides political, military, mine action, and administrative components, and included an apparatus for harmonization with the humanitarian community.\textsuperscript{105} The Eritrean government effectively stymied UNMEE from broadcasting over the airwaves for a period of approximately six months. Radio programs were made available on the UNMEE website, but these were accessible to only a very small minority of the Eritrean public. Additional problems regarding government screening of the UN-produced magazine, too, arose with Eritrea in 2004, causing magazine publication to cease for a number of months until the situation was resolved through negotiations.\textsuperscript{106}

1. Hierarchy of Needs

Ethiopia is one of the poorest countries in the world with its per capita income of only $110 per year. Agriculture accounts for half of the country’s GDP, accounting for ninety percent of all exports and eighty percent of total employment. The agriculture sector often suffers from drought and poor cultivation practices leaving over five million people in need of food assistance each year. Given the low life-expectancy rates and literacy rates, the lower costs of broadcast and infrastructure, radio makes it the most significant tool for IODP in Ethiopia. Therefore, the UN should have aimed for radio programs wherever the local government allows and should run local radio stations in

different local languages. Wind-up radios should have been delivered to the people in rural areas who may have difficulty in acquiring electricity or buying batteries. Printed media tools such as posters and newspapers would also have worked to reach the literate people of Ethiopia. The potential of the Ethiopian society could have improved educational programs that increased growth literacy rates and the delivery of media tools such as radios so that media outreach can be enlarged. As was done with the video clubs in Liberia, any opportunity to engage with the social texture should have been utilized.

2. Operational Environment

The Ethiopian State owns and strictly controls the primary media of television and radio. Not only is there no independent TV and radio in Ethiopia, but access to information is also tightly controlled. At a United Nation's peacekeeping mission in Eritrea, Ethiopia, and Addis Ababa in the summer of 2001, Joseph Legwaila, Special Representative to Secretary General of the UN (SRSG), said he feels “sorry for the repression of journalists in Eritrea and Ethiopia, but protecting free press is not part of the mission's mandate.”

The focus in the Information Operations campaign in Ethiopia was centered on increasing operational effectiveness against internal and external threats, influencing public opinion to support United Nations peacekeeping activities, and ensuring the stability during crises. However, the Public Information campaign was slow moving and plagued with problems with the Ethiopian and Eritrean governments. In Ethiopia, the media had been deeply polarized, reflecting some divisions of trust in UN Information Operation Campaigns. The UNIODP was difficult in Ethiopia because the government had such a tight control over the media. The governments of Ethiopia and Eritrea run, monitor, and regulate every aspect of the media. UNIODP relied heavily on private local media outlets, Western media, and word of mouth to convey their messages.

Throughout the war, “reporters on both sides peddled hate propaganda and serious insults in newspapers, radio, and television, calling each other puppets of their respective governments,” says Nita Bhalla, the BBC correspondent in Ethiopia's capital, Addis

Ababa. He notes that private newspapers won respect by sending reporters out to the front lines to bring back stories that “were supportive of the war effort.”\textsuperscript{108} For the two rival governments, the press was a vital tool in garnering support during the border dispute.

3. Two-Way Communication

Considering the conditions under which the UN IODP conducts their tasks in contemporary peacekeeping missions, it must be admitted that communication is much more challenging than it is under standard circumstances. The UN IODP must conduct their Information Operations campaigns with the effort to target various organizations and individuals who belong to different cultural backgrounds and such conditions demand specialized communication tools that enforce two-way communications. However, in these countries and particularly in Eritrea, UNMEE was not able to bring these tools into being due to the hindrance from local governments.

The UNIODP established a precedent that Information Operations campaigns were to be structured around issues of development and aid, rather than political questions such as the constitution or land borders. For example, the Public Information Office established Outreach Centers in Ethiopia and Eritrea in 2002 to inform local populations about UNMEE’s role in the peace process. The Outreach Centers in Ethiopia were based in Addis Ababa, Mekelle, and Adigrat. Outreach Centers in Eritrea were established in Asmara and Barentu but were closed in 2003 at the request of the government. By September 2005, the three Outreach Centers in Ethiopia had welcomed 150,000 visitors. Between July, 2006, and June, 2007, more than 40,000 people visited the centers.

Outreach Center staff visited schools, universities, and local organizations to answer questions about UNMEE and distribute copies of the bi-monthly UNMEE news magazine and other UN publications. Staffs at the Mekelle and Adigrat Outreach Centers continue to provide information services for the northern Tigray region, traveling

hundreds of miles to distribute magazines and screen videos from a mobile van. The centers distribute print, radio, and video materials about UNMEE and the United Nations. They also have computers with internet access that students can use to research peacekeeping and other UN-related school and university assignments.

4. One-Way Communication

Because positive media coverage can significantly support the UN IODP, media constitutes an important element of the IODP information campaigns. Communication with the media and the way they report about UN IODP operations considerably influences host nations. Using resources like TV, newspapers, and radio allows the local population knowledge about the positive things happening with UN peacekeeping in their country and what the mandate and the main objectives of the UNMEE are. Local interaction with the population through meetings with local authorities, tribal leaders and individuals, and quick-impact, country-development projects conducted by UNMEE usually attracted media attention. On such occasions, it was able to dramatically improve the image of the UN IODP, thus contributed to major improvements in the whole peacekeeping effort.

In Ethiopia, the UN IODP’s overall strategy for managing information flow was to control the message from the center of gravity to the periphery. Because government regulations were difficult to penetrate, and there was no UN mandate that included free speech for the press, the UN IODP had to adopt different approaches to disseminate their message. Word of mouth, for example, became a major tool for centralizing UN Information Operation campaigns and ensuring that the local populations received the message. This communication, though employing an interactive mechanism, was largely one-way. The UN IODP disseminated messages through local officials who were “trained” in Information Operations. Overall, the UN IODP information strategy targeted the poor. This received a greater push in the aftermath of the 2005 elections. There are parallels; for example, the UN IODP focused on rural communities, as they were more receptive to receiving messages based on economic development as compared to party

ideals. These people are then organized into small groups that receive training and serve as a source of information, but most importantly, as conduits for developmental messages.

UNMEE radio first broadcasted from Eritrea in January 2001 with a one-hour program twice a week. Eritrea suspended broadcasts in October 2001, and permitted resumption of the one-hour shows in June 2002. Ethiopia did not cede control of its airwaves, and refused to give UNMEE free airtime. To help circumvent these local difficulties, UNMEE began shortwave broadcasts from the United Arab Emirates, with one-hour shows on Tuesdays and Fridays. Considerably reducing the effective length of its shows, UNMEE divided each hour into English and anywhere between three to five local languages.\textsuperscript{110}

5. Information Dissemination

The dissemination of information products through various mediums—television, Internet, radio, face-to-face contact—in order to influence decision making, still poses challenges to the United Nations PI in countries like Eritrea and Ethiopia. The channels mentioned of course make it easier to ensure the information is delivered to the population; however, with so much information being delivered to the public, it can be hard for them to decide what is truly time-sensitive as compared to what is trivial and unimportant. Face-to-face interaction with the population will always be the most effective means of influence. The focus of the UN IODP must be on the center of gravity in any conflict: the country’s people and their belief in and support of the UN’s Public Information campaign. Winning their hearts and minds must be the objective of the UN IODP efforts. Information that appears as propaganda or PSYOPs, may not only be rejected but can also be counterproductive to an ongoing Public Information Campaign. Under new Information Age conditions, an information campaign that involves the IODP must take appropriate actions to influence the population to assume a positive, participative, and supportive attitude towards UN peacekeeping operations.

\textsuperscript{110} Lindley, Untapped Power? The Status of UN Information Operations16.
In this context, Information Operations campaigns represent useful techniques through which the UN IODP can attain their PI objectives. For programming and implementations, innovative and creative adaptations of popular cultures can be used almost as a form of entertainment. As Hunt states, entertainment programs, street theaters, leaflets, brochures, competitions, or posters can be more effective to give out the message indirectly in the form of an entertainment program as opposed to direct indoctrination. Additionally, he believes the message can be better understood if it is represented through someone or something that is championed and easily identifiable to the local population. Given the low literacy rates of some host countries, there is even more need for this indirect approach, particularly in African countries such as Ethiopia and Eritrea. Today, Ethiopian and Eritrean leaders say they are working hard on new press laws that would curb foreign or “terrorist” funding of the local press.

---

V. RECOMMENDATIONS AND CONCLUSION

In the years ahead, United Nations Information Operations during Peacekeeping (IODP) will become an area of increasing importance, and possible strategic challenges. The net result of a changing peace operations combined with the enduring interests of the United Nations will result in a notable growth in UN IODP. However, the UN on its own may not be sufficient. They need to involve other organizations, NGOs, and possibly military support to accomplish their mission. For example, their work in Kosovo should be used as an example on how to accomplish and achieve a successful UN IO mission. This worked because they were operating in a region where their mission was primarily understood. They should utilize elements from this mission and try to apply it to areas where the UN mission is not clearly defined.

An examination of the current UN IODP must not just examine lessons learned, and professional opinions: it must consider how IODP challenges with the population in current peacekeeping operations necessitate adjustments and adaptations. The UN IODP was successful in Kosovo and mildly successful in Liberia because the UN IODP was able to tie their approach and message of change and improvement to the local populations’ everyday lives. If a person is persuaded to go along with another’s purposes without any explicit threat or exchange taking place, influence is at work; this is how the UNIODP was able to maintain success in Kosovo and Liberia and become a leading force among NGOs and other outreach organizations in the areas where they were involved.

Moreover, the most important element in the UN IODP’s success in Kosovo and Liberia was its support from the population. Information Operations are thus a critical aspect of any peace operations. The media reach not only the homes of citizens, but also their minds. The ability to control the message being presented may result in the ability to influence the thoughts but possibly even the behavior of the recipient of the message.

UN peacekeeping operations are not likely to succeed without gaining the support of the host nations and Information Operations are essential for this support. Although the UN does not acknowledge that it uses IO to affect the host populations, our case
studies show that the media and communication tools are used by the UN with an aim of social change in host nations towards peace and development goals. Case studies also show that the effectiveness of this Information Operations (IODP) can be increased by an interactive, communicative, informing, and entertaining approach. With this approach, direct and indirect feedback from the audience is attained through call-ins, emails, text messages and face-to-face friendly meetings. This feedback is then evaluated with care and used for increasing the effectiveness through corrections and updates. Although news and awareness programs are the frontline of the IODP, sometimes these operations need to go beyond these serious tasks.

The entertaining features of the media should also be used in IODP such as talk shows, cartoons, TV and radio dramas, comedy shows, quiz shows, soap operas, comic books, theatre presentations and even songs. As a result, the PI should not be confined to the direct methods of news and information dissemination, but on the contrary include the beneficial indirect methods of the above-mentioned media tools.\(^\text{112}\)

As mentioned in the previous chapter, there are a lot of complications in the post-conflict countries lowering the trust of the people towards local media. As Hunt stated, most journalists in these countries are beginners since many of the previous journalists were killed or displaced during the conflict.\(^\text{113}\) Generally, the local government and internal mechanisms of the media are incapable and/or unenthusiastic about increasing the capacity of the media. Therefore capacity-building activities such as training of media members, advertisement giving and editing assistance should also be provided for the local media.

The UN’s mission should cause no harm to the local media. Although it is a requirement to hire some local media members in the PI section, and in the UN media outlets, the local media force should not be undermined. For example, all of the famous reporters and editors should not be hired. Likewise the footprint of the IODP should be balanced and a soft exit strategy must be planned in advance. In some instances media

\(^{112}\text{Howard, An Operational Framework for Media and Peacebuilding, 4.}\)

\(^{113}\text{Hunt, Public Information as a Mission Critical Component of West African Peace Operations, 12.}\)
outlets like UNMIL radio become very prominent for the local population and when the mission is aborted, it may cause a feeling of deprivation. A substitute for this kind of media outlet should be created and supported in the local media and time must be allowed for people to get adapted. Likewise all the directorial and field tasks should not be assumed by internationals. Trained local members should be given roles and prepare for maintaining these tasks after the end of mission.

There is still a need for the HQ-level leaders to further appreciate the importance of the PI. In order to solve this problem, the leaders of the HQ should take the feedback from the field into account both from the local population and mission members. Cultural awareness and sensitivity, and understanding the background in which they operate are very important. Even in the initial phase of the mission the case specific features must be evaluated and be taken into account. They should be updated throughout the operation with the help of the daily information and feedback from the media audience.

During interactions with local media, the PI officers should not expect a quick stride. It should always be kept in mind that development of a free and honest media in emerging democracies requires time. The local media should be supported with training on professional norms, even small accomplishments on Universal media norms and ethics should be encouraged and rewarded.

Information sharing and collaboration problems should be solved within the humanitarian community and there must be strong links between PI sections and executive mechanisms of the mission. Since the PI section makes the advertisement of the active sections, it needs to be aware of the challenges active sections face and the requirements of those duties, and vice versa. In order to enable harmony and information sharing within the mission, IODP must be in the UN mission mandate. Otherwise it will be unlikely to be addressed as a coherent, unified program by the leaders on the ground.
