Mathematical Analyses of Landside Seepage Berms

Reginald A. Barron

62 Horseshoe Road
Guilford, Connecticut 06437

Approved for public release; distribution unlimited.

This report describes a study that extends solutions for mathematical analyses of seepage berms presented in "Investigation of Underseepage and Its Control, Lower Mississippi River Levees," Technical Memorandum 3-424, Vol 1, October 1956, US Army Engineer Waterways Experiment Station.

A plot of the required seepage berm width, $B$, versus the ratio of the permeability of the berm to the top blanket, $K$, for various safety factors indicates $B$ is very sensitive to $K$ for $K \leq 1$. When the (Continued)
20. ABSTRACT (Continued)

uplift safety factor varies from 1.5 at the landside levee toe to 1.0 at the landside seepage berm toe, the berm width is only slightly greater than that for a uniform safety factor of 1.0. If the uplift safety factor is greater than 1.0 at the berm toe, then as the top blanket becomes thinner, the berm width becomes longer. Thus, other methods of underseepage control should be investigated to determine whether they may be more economical.

When the seepage berm is impervious, the berm width is a maximum. When the seepage berm is infinitely pervious, the berm width is a minimum. Therefore, seepage berms should be constructed of the most pervious soils available (with adequate provisions for control of surface erosion and internal piping) in the interest of economy.

Because of the great difficulty in determining the permeability of the foundation, top blanket, and seepage berm, the mathematical solutions presented in this report should be used only as a guide to good engineering judgement. A range of permeability values should be used rather than average values.

Supplements 1, 2, and 3 have been added to this corrected version to present solutions for seepage berms with constant slope of upper surface, riverside seepage berms, and general cases and short berms, respectively.
Preface

The first draft of this report was prepared by Mr. Reginald A. Barron (now deceased), Consulting Engineer, as part of the work being performed by the US Army Engineer Waterways Experiment Station (WES) on revision of Engineer Manual 1110-2-1901, "Seepage Control." Funds for this work were provided by Headquarters, US Army Corps of Engineers (HQUSACE), under CWIS Work Unit 31836. Mr. Barron was subsequently funded by WES via Purchase Orders DACW39-79-M-4486, dated 26 July 1979, DACW39-81-M-1323, and DACW39-81-M-3076. The report was completed and published at WES under the auspices of the Repair, Evaluation, Maintenance, and Rehabilitation (REMR) Research Program.

This report supersedes WES Miscellaneous Paper GL-80-15. The main text of that report has been corrected and three supplements have been added to produce this version.

The contracts under which the first draft was prepared were managed by Dr. Edward B. Perry, Soil Mechanics Division (SMD), Geotechnical Laboratory (GL), under the general supervision of Mr. Clifford L. McAnear, Chief, SMD, and Dr. William F. Marcuson III, Chief, GL.

Special acknowledgement is made to the earlier work done on the seepage berm theory by Messrs. P. T. Bennett (retired), Missouri River Division, and R. I. Kaufman, Lower Mississippi Valley Division (LMVD). Valuable assistance was given by Mr. C. K. Smith (retired), HQUSACE, who reviewed the first draft of the report and suggested that the boundary conditions at the seepage berm toe and levee toe be considered in a more exact manner for the finite difference solutions than the approximate manner in the first draft. Technical assistance was provided by the geotechnical staffs of Rock Island District, North Central Division, and LMVD.

Commanders and Directors of WES during the preparation and publication of this report were COL Nelson P. Conover, CE, COL Tilford C. Creel, CE, and COL Robert C. Lee, CE. Mr. F. R. Brown was Technical Director.

1. This report is a compilation of studies done by the author in the early 1950's and late 1970's. In the 1950's, work was also done by Mr. P. T. Bennett, Missouri River Division, and by Mr. R. I. Kaufman, US Army Engineer Waterways Experiment Station, now at the Lower Mississippi Valley Division. The results of these early studies are presented in TM 3-424.* These early studies were mainly concerned with seepage berms that had a coefficient of permeability equal to that of the landside top blanket. Studies by the author in 1979 have extended the solutions to include cases where the berm permeability is not that of the top blanket. In one case, the solution of the differential equation has not been obtained and an approximation has been developed using finite differences. Supplements No. 1, 2, and 3 to this report present solutions for seepage berms with constant slope of upper surface, riverside seepage berms, and general cases and short berms, respectively.

Assumptions

2. The foundation conditions for dams and levees are so complex that it is necessary to make simplifying assumptions so that mathematical solutions may be obtained to determine the influence of downstream seepage berms on seepage and seepage uplift heads. Because of these assumptions, any solution obtained is an approximation of the real conditions. The solutions should be regarded as aids to engineering judgement. The assumptions are:

a. Two-dimensional seepage is in a vertical plane.

b. The top blanket and the pervious foundation extend in a landward direction to infinity.

* US Army Engineer Waterways Experiment Station. 1956. "Investigation of Underseepage and Its Control, Lower Mississippi River Levees," Technical Memorandum 3-424, Vol 1, Vicksburg, MS.
c. The top blanket is at least ten times less pervious than the lower pervious foundation.

d. The top blanket is pervious only in a vertical direction. Thus, the permeability in the horizontal direction is zero.

e. Except where specifically noted, the permeability of the seepage berm conforms to d above. The permeability of the berm may be different from that of the top blanket.

f. The pervious foundation is pervious only in the vertical direction, and the permeability in the horizontal direction is zero.

g. The pervious foundation rests upon an impervious foundation.

h. The seepage berm, the semipervious top blanket, and the pervious foundation are homogeneous.

i. The central part of the levee and the underlying top blanket are impervious.

j. The landside water table is at, or above, the top of the top blanket.

k. Except where specifically stated otherwise, the seepage flows upward through the seepage berm to emerge on its upper surface. Thus, the upper surface of the seepage berm is not an equipotential surface.

l. The seepage through the foundation, top blanket, and seepage berm is not time-dependent.

Case I - Impervious Berm

3. The permeability of the seepage berm is zero for this case. However, there may be cases where the berm thickness is so great, and because it is assumed that the berm horizontal permeability is zero, that there will be no upward seepage in the berm. The latter case will have the same foundation seepage and uplift at the base of the top blanket as that for the case where the berm is impervious. The uplift head at the downstream (or landward) toe of the seepage berm is \( h_a \).

The seepage uplift safety factor, \( F \), at this location is expressed as

\[
F = \frac{Z_L Y_b}{h_a Y_w} \tag{1}
\]
where

\[ Z_b = \text{thickness of the semipervious top blanket} \]

\[ \gamma'_b = \text{buoyant weight of the semipervious top blanket} \]

\[ h_a = \text{allowable seepage head at the landside seepage berm toe} \]

\[ \gamma_w = \text{unit weight of water} \]

Rearranging Equation 1 results in

\[ h_a = \frac{Z_b \gamma'_b}{\gamma_w F} \]  \hspace{1cm} (2)

h. A schematic hydraulic potential profile is shown below (no upward seepage under or through the seepage berm).

where

\[ H = \text{net hydraulic head} \]

\[ h_t = \text{uplift under the semipervious top blanket at the landward or downstream toe of the impervious levee or dam} \]

\[ h_a = \text{uplift under the semipervious top blanket at the landward or downstream toe of the seepage berm} \]

\[ B = \text{downstream width of the seepage berm} \]

\[ L_2 = \text{base width of the impervious levee or dam} \]

\[ L_{LS} = \text{effective landside length of the semipervious top blanket} \]

\[ X = \text{effective riverside or upstream length of the semipervious top blanket} \]

\[ x = \text{horizontal distance measured landward from downstream toe of the levee or dam} \]

H and \( h_a \) are related as
Thus, the seepage berm length, $B$, becomes

$$B = \frac{HL_{LS}}{h} - \left( \frac{X + L_2 + L_{LS}}{h} \right)$$

Substituting the value of $h$ from Equation 2 into Equation 4 results in

$$B = \frac{HL_{LS} y'_w}{Z_b y_b} - \left( \frac{X + L_2 + L_{LS}}{h} \right)$$

The seepage uplift under the seepage berm varies in a linear manner from $h_t$ at $x = 0$ at the landward levee toe to $h_a$ at $x = B$ at the landward toe of the seepage berm. This condition is a result of the berm being impervious with no upward seepage through the top blanket under the berm. The uplift, $h_x$ at point x, where $0 < x < B$, is expressed as

$$h_x = h_t - \left( h_t - h_a \right) \frac{X}{B}$$

5. The permeability of the seepage berm is assumed to be zero (or nearly so), but sufficient seepage upward is assumed to render it buoyant. The uplift safety factor for the seepage berm and the semi-pervious top blanket at $0 < x < B$ is

$$F_x = \frac{t_x y'_w}{(h_x - t_x) y'_w}$$

The berm thickness, $t_x$ at point x, is written as
\[ t_x = \frac{h_x \gamma W X}{\gamma_X + \gamma W X} \]  

(8)

where \( F_x \) is the safety factor at point \( x \) that may be a constant or a variable with \( x \).

Example: (to be used throughout this report)

\[ H = 30 \text{ ft}, \quad Z_b = 5 \text{ ft}, \quad D = 50 \text{ ft}, \quad k_f/k_b = 200, \]

\[ L_2 = 200 \text{ ft}, \quad \gamma_w = \gamma_b' = \gamma_t', \quad \text{and} \quad L_1 = 500 \text{ ft} \]

where

- \( D \) = thickness of the pervious foundation
- \( k_f \) = horizontal permeability coefficient of the pervious foundation
- \( k_b \) = vertical permeability coefficient of the top blanket
- \( \gamma_t' \) = buoyant unit weight of the seepage berm
- \( L_1 \) = length of the riverside top blanket

The length of the landside top blanket is infinite. A generalized cross section of the geologic strata, levee, and seepage berm is shown in Figure 1.

6. The effective riverside length of the semipervious top blanket is expressed as

\[ \bar{X} = \frac{\tanh (cL_1)}{c} \]

* A table of factors for converting non-SI units of measurement to SI (metric) units is presented on page 3.
Figure 1. Generalized cross section of geologic strata, levee, and seepage berm.
where
\[ c = \left( \frac{k_b}{k_{DZ_b}} \right)^{1/2} \]
\[ = \frac{1}{\sqrt{200 \times 50 \times 5}} \]
\[ = \frac{1}{223.6 \text{ ft}} \]

\[ \bar{X} = 223.6 \tanh \left( \frac{500}{223.6} \right) = 218.5 \text{ ft} \]

The effective landside length of the semipervious top blanket is then

\[ L_{LS} = \frac{1}{c} = 223.6 \text{ ft} \]

By substituting the values above in Equation 5, the width of the seepage berm becomes

\[ B = \frac{30 \times 223.6 \times 1 \times 1}{5 \times 1} \left( 218.5 + 200 + 223.6 \right) \]
\[ = 1341.6 \text{ ft} - 642.1 \]

For a safety factor that is uniform for \( 0 < x < B \), the required berm length, \( B \), is given in the following tabulation. It should be noted that the value of \( B \) is a maximum for a given safety factor because of the imperviousness of the berm. Also, \( B \) will be less for other cases where the berm permeability is greater than zero.

7. The uplift at the landside levee toe (\( x = 0 \)) is expressed as

\[ h_t = \frac{H (B + L_{LS})}{\bar{X} + L_2 + B + L_{LS}} = \frac{30 (B + 223.6)}{B + 642.1} \]

8. For a constant safety factor, the berm thickness varies in a
linear manner from a maximum value at the landside toe of the levee to a minimum at \( x = B \). The berm thickness at \( x = 0 \) is \( t \); by using Equation 8, the values of \( t \) are obtained as given in the following tabulation.

<table>

</tr>
</tbody>
</table>

9. The tabulation given above, and those which follow, are for illustrative purposes. The safety factor at the landside levee toe and the landside berm toe for design use are items that depend on judgement and will not be discussed in this report. The uplift safety factor at the landside levee toe should be such as to prevent slope failure under maximum riverside pool. Note that the safety factor is uniform throughout the width of the berm. However, variable safety factors may be used. For example, assume that \( F = 1.5 \) at the levee toe and 1.0 at the berm toe with \( B = 700 \text{ ft} \) and \( h_t = 20.65 \text{ ft} \). Then by substituting in Equation 8

\[
t = \frac{20.65 \times 1 \times 1.5}{1 + (1 \times 1.5)} = 12.4 \text{ ft}
\]

**Case II - Infinitely Pervious Berm**

10. This case can be approached in theory but not realized in design; however, it is closely approached when the top blanket permeability is very much smaller than that of the berm (an order of 1 to 500). The berm is assumed to be made of such pervious soil that no head loss occurs in the vertical or horizontal seepage at the base of the
berm. The equations describing the flow conditions in the top blanket were presented by Bennett.* The origin of the \( x \) coordinate is at the landside levee toe and is positive landward. The assumption of infinite horizontal permeability for the berm negates assumption \( e \) (see paragraph 2) for this case.

11. The uplift head at the base of the top blanket under the landside levee toe, \( h_t \), is expressed as

\[
h_t = \frac{HL_{LS}}{X + L_2 + L_{LS}} \tag{9}
\]

12. The uplift head under the semipervious top blanket at the berm landside toe, \( h_a \), is controlled by the uplift safety factor. The uplift head at the base of the top blanket, \( h_x \) at point \( x \), landward of the landside levee toe is written as

\[
h_x = h_t e^{-cx} \tag{10}
\]

At \( x = B \) (landside berm toe), \( h = h_a \); by using Equation 2

\[
h_a = \frac{Z_b y_b'}{\gamma_w F}
\]

then

\[
-cB = \ln \left( \frac{Z_b y_b'}{\gamma_w F h_t} \right) \tag{11}
\]

By rearranging Equation 11, the berm width, \( B \), becomes

---

\[ B = \frac{1}{c} \ln \left( \frac{\gamma_w F h_t}{Z_b \gamma_b t} \right) \]  \hspace{1cm} (12)

Assuming that the landside tailwater is just at the top of the semi-pervious top blanket, the safety factor against uplift, \( F_x \), at point \( x \), is expressed as

\[ F_x = \frac{Z_b \gamma_b + t_x \gamma_m}{h_x \gamma_w} \]  \hspace{1cm} (13)

Then, the berm thickness, \( t_x \) at point \( x \), can be written as

\[ t_x = \frac{h_x \gamma_m F - Z_b \gamma_b}{\gamma'_m} \]  \hspace{1cm} (14)

where \( \gamma'_m \) is the moist unit weight of the berm and \( h_x \) is obtained from Equation 10. If part of the berm is submerged, then that part requires the use of a buoyant weight in computing the berm thickness.

13. Using the data for the example given in Case I (see paragraph 5), a uniform safety factor and a moist unit weight, \( \gamma'_m \), that is twice as large as the buoyant unit weight of the top blanket, \( \gamma'_b \), and the unit weight of water, \( \gamma_w \), the uplift under the landside levee toe, \( h_t \), is determined by substituting in Equation 9.

\[ h_t = \frac{30 \times 223.6}{218.5 + 200 + 223.6} = 10.45 \text{ ft} \]

Also,

\[ h_a = \frac{5 \times 1}{1 \times F} \]

\[ B = 223.6 \ln \left( \frac{1 \times F \times 10.45}{5 \times 1} \right) \]

\[ \gamma'_m = 2 \gamma'_b = 2 \gamma_w \]

\[ t = \frac{10.45 \times 1 \times F - (5 \times 1)}{2} \]
The berm thickness, \( t \) at \( x = 0 \), is given in the following tabulation.

<table>
<thead>
<tr>
<th>Safety Factor ( F )</th>
<th>Berm Length ( B, \text{ ft} )</th>
<th>Uplift at ( x = B ) ( h_a, \text{ ft} )</th>
<th>Berm Thickness ( t ) at ( x = 0 ) ( \text{ft} )</th>

</tbody>
</table>

14. The berm thickness for the case where the uplift safety factor is 1.5 is determined by substituting in Equations 10 and 14.

\[
h_x = 10.45e^{-x/223.6}
\]

\[
t_x = \frac{(h_x \times 1 \times 1.5) - (5 \times 1)}{2}
\]

The following tabulation is obtained for \( h_x \) and \( t_x \).

</table>

Case III - Infinitely Pervious Berm in Vertical Direction

15. In this case, the horizontal permeability equals zero, and the safety factor is constant. The differential equation for seepage

14
upward through the top blanket and berm is written as

\[
\frac{k_b D_d^2 h}{dx^2} = \frac{k_b (h_x - t_x)}{z_b} \tag{15}
\]

It should be noted that only the semipervious top blanket has seepage resistance since the vertical permeability of the berm is infinite.

16. Equation 15 can be expressed as

\[
\frac{d^2 h}{dx^2} = \frac{k_b}{k_e D_{zb}} (h_x - t_x) = c^2 (h_x - t_x) \tag{16}
\]

where \( t_x \) is the variable thickness of the berm. The seepage flows vertically in the berm (the horizontal permeability assumed to be zero). The berm has a buoyant unit weight, \( \gamma'_b \).

17. The uplift safety factor of the combined seepage berm and top blanket is then

\[
F = \frac{Z_b \gamma'_b + t_x \gamma'_t}{(h_x - t_x) \gamma_w} \tag{17}
\]

and

\[
h_x - t_x = \frac{Z_b \gamma'_b + t_x \gamma'_t}{\gamma_w F}
= \frac{Z_b \gamma'_b}{\gamma_w F} + \frac{t_x \gamma'_t}{\gamma_w F}
\]

so that

\[
h_x - \frac{Z_b \gamma'_b}{\gamma_w F} = t_x \left(1 + \frac{\gamma'_t}{\gamma'_w F}\right) = t_x \left(\frac{\gamma'_w F + \gamma'_t}{\gamma'_w F}\right)
\]

and
where the berm thickness, $t_x$, at point $x$, is expressed in terms of the uplift, $h_x$, at the base of the semipervious top blanket, the safety factor, unit weights, and top blanket thickness.

18. Set

$$\frac{\gamma_w F}{\gamma_w F + \gamma_t} = A$$

$$\frac{Z_b \gamma'_b}{\gamma_w F + \gamma'_t} = B$$

$$\frac{k_b}{k_{fD} Z_b} = c^2$$

Then Equation 16 can be expressed as

$$\frac{d^2h}{dx^2} = c^2 (h_x - t_x) = c^2 (h_x - h_x A + B)$$

$$= h_x c^2 (1 - A) + c^2 B$$

$$= h_x \theta + \xi \quad (19)$$

where

$$c^2 (1 - A) = \theta$$

and

$$c^2 B = \xi$$
Now set

\[ h_x \theta + \xi = y \]

\[ \theta \frac{dh}{dx} = \frac{dy}{dx} \]

\[ \frac{d^2h}{dx^2} = \frac{1}{\theta} \left( \frac{dy^2}{dx^2} \right) = y \] \hspace{1cm} (20)

so that

\[ \frac{d^2y}{dx^2} = \theta y \] \hspace{1cm} (21)

A solution to Equation 21 is

\[ y = C_1 e^{x\sqrt{\theta}} + C_2 e^{-x\sqrt{\theta}} = \theta h_x + \xi \] \hspace{1cm} (22)

or

\[ h_x = \frac{C_1}{\theta} e^{x\sqrt{\theta}} + \frac{C_2}{\theta} e^{-x\sqrt{\theta}} - \frac{\xi}{\theta} \] \hspace{1cm} (23)

The coordinate system is zero at the landward berm toe, and \( x \) is positive in the landward direction. At \( x = 0 \) (berm landward toe), \( h = h_a \); thus

\[ h_a = \frac{C_1}{\theta} + \frac{C_2}{\theta} - \frac{\xi}{\theta} \] \hspace{1cm} (24)

Now

\[ \frac{\xi}{\theta} = \frac{c^2 \beta}{c^2 (1 - A)} = \left( \frac{Z_0 y'_b}{y'_w + \gamma'_t} \right) \left( \frac{\gamma'_w + \gamma'_t}{\gamma'_t} \right) \] \hspace{1cm} (25)
and so Equation 24 may be expressed as

$$\left( h_a + \frac{Z_b' \gamma_b'}{\gamma_t'} \right) \theta = C_1 + C_2$$

(26)

but

$$\theta = c^2 (1 - A) = c^2 \left( \frac{\gamma_t'}{\gamma_w' F + \gamma_t'} \right)$$

and Equation 26 becomes

$$\left( h_a + \frac{Z_b' \gamma_b'}{\gamma_t'} \right) \left( \frac{c^2 \gamma_t'}{\gamma_w' F + \gamma_t'} \right)$$

(27)

At $x = 0$

$$\frac{dh}{dx} = -\frac{h_a}{L_{LS}} = \frac{C_1 \sqrt{\theta}}{\theta} - \frac{C_2 \sqrt{\theta}}{\theta}$$

(28)

Thus, the two simultaneous equations that result are

$$C_1 - C_2 = -\frac{h_a \sqrt{\theta}}{L_{LS}}$$

(29)

$$C_1 + C_2 = \left( h_a + \frac{Z_b' \gamma_b'}{\gamma_t'} \right) \theta$$

(30)

Then

$$C_1 = \left( h_a + \frac{Z_b' \gamma_b'}{\gamma_t'} \right) \frac{\theta}{2} - \frac{h_a \sqrt{\theta}}{2L_{LS}}$$

(31)

and

$$C_2 = \left( h_a + \frac{Z_b' \gamma_b'}{\gamma_t'} \right) \frac{\theta}{2} + \frac{h_a \sqrt{\theta}}{2L_{LS}}$$

(32)

so that Equation 23 becomes

18
\[ h_x + \frac{Z_b y'_b}{\gamma'_t} = \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \frac{e^{x\sqrt{\theta}}}{2} - h_a \frac{\sqrt{\theta}}{2L_{LS} \theta} e^{x\sqrt{\theta}} \]

\[ + \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \frac{e^{-x\sqrt{\theta}}}{2} + h_a \frac{\sqrt{\theta}}{2L_{LS} \theta} e^{-x\sqrt{\theta}} \]

\[ = \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \frac{e^{x\sqrt{\theta}} + e^{-x\sqrt{\theta}}}{2} - h_a \frac{e^{x\sqrt{\theta}} - e^{-x\sqrt{\theta}}}{2L_{LS} \sqrt{\theta}} \]

\[ = \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \cosh (x\sqrt{\theta}) - h_a \frac{1}{L_{LS} \sqrt{\theta}} \sinh (x\sqrt{\theta}) \quad (33) \]

At \( x = -B \) (lands side levee toe), \( h = h_t \); thus

\[ h_t + \frac{Z_b y'_b}{\gamma'_t} = \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \cosh (B\sqrt{\theta}) + h_a \frac{1}{L_{LS} \sqrt{\theta}} \sinh (B\sqrt{\theta}) \quad (34) \]

Also, at \( x = -B \)

\[ \frac{dh}{dx} = - \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \sqrt{\theta} \sinh (B\sqrt{\theta}) - h_a \frac{1}{L_{LS}} \cosh (B\sqrt{\theta}) \]

\[ = \frac{H - h_t}{\overline{x} + L_2} \quad (35) \]

\[ H - h_t = \left( \overline{x} + L_2 \right) \sqrt{\theta} \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \sinh (B\sqrt{\theta}) \]

\[ + \left( \overline{x} + L_2 \right) \frac{h_a}{L_{LS}} \cosh (B\sqrt{\theta}) \quad (36) \]
Now, substitute in Equation 34 to obtain

\[ H - h_t = \left( H + \frac{Z_b y'_b}{\gamma'_t} \right) - \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \cosh (By) \]

\[ - \frac{h_a}{L_{LS} \sqrt{\theta}} \sinh (B \sqrt{\theta}) \]  

(37)

Then equate Equations 36 and 37 to obtain

\[ H + \frac{Z_b y'_b}{\gamma'_t} = \cosh (B \sqrt{\theta}) \left[ (X + L_2) \frac{h_a}{L_{LS}} + \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \right] \]

\[ + \sinh (B \sqrt{\theta}) \left[ \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) (X + L_2) \sqrt{\theta} \right] \]

\[ + \frac{h_a}{L_{LS} \sqrt{\theta}} \]  

(38)

Now

\[ h_a = \frac{Z_b y'_b}{\gamma'_w F} \]

and

\[ \sqrt{\theta} = c \sqrt{\frac{\gamma'_t}{\gamma'_t + \gamma'_w F}} \]

so that

\[ H + \frac{Z_b y'_b}{\gamma'_t} = \bar{a} \cosh (B \sqrt{\theta}) + \bar{b} \sinh (B \sqrt{\theta}) \]  

(39)

where

\[ \bar{a} = \frac{Z_b y'_b}{\gamma'_t} + h_a \left( \frac{X + L_2 + L_{LS}}{L_{LS}} \right) \]
\[ B = \left( h_a + \frac{Z_b}{y_t} \right) (x + L_2) \sqrt{\theta} + \frac{h_a}{l_{LS} V_0} \]

and so

\[
\left( H + \frac{Z_b y_t}{y_t} \right) - \bar{A} \cosh (B \sqrt{\theta}) - \bar{B} \sinh (B \sqrt{\theta})
\]

\[
= \left( H + \frac{Z_b y_t}{y_t} \right) - \frac{\bar{A}}{2} (e^{B \sqrt{\theta}} + e^{-B \sqrt{\theta}}) - \frac{\bar{B}}{2} (e^{B \sqrt{\theta}} - e^{-B \sqrt{\theta}})
\]

\[
= \left( H + \frac{Z_b y_t}{y_t} \right) - \left( \frac{\bar{A} + \bar{B}}{2} \right) e^{B \sqrt{\theta}} - \left( \frac{\bar{A} - \bar{B}}{2} \right) e^{-B \sqrt{\theta}} = \delta \quad (40)
\]

For any given set of conditions various values of berm length, \( B \), are tried until \( \delta \) is equal to zero.

Example: (same as for Case I)

\[
\sqrt{\theta} = \frac{1}{\sqrt{200 \times 50 \times 5}} \times \frac{1}{\sqrt{1 + F}}
\]

\[
= \frac{1}{\sqrt{50,000}} \times \frac{1}{\sqrt{1 + F}}
\]

\[
= \frac{1}{223.6} \times \frac{1}{\sqrt{1 + F}}
\]

The following tabulations illustrate Case III, for the infinitely pervious berm in the vertical direction.

<table>
<thead>
<tr>
<th>Safety Factor</th>
<th>( h_a ), ft</th>
<th>( 10^3 (\sqrt{\theta}) )</th>
<th>( \frac{h_a}{L_{LS} V_0} )</th>
<th>( h_a + Z_b \sqrt{\theta} )</th>
<th>( (h_a + Z_b) \times (x + L_2) \sqrt{\theta} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0</td>
<td>5.0000</td>
<td>3.162</td>

<td>2.828</td>
<td>5.2705</td>
<td>8.333</td>
<td>9.8623</td>
</tr>
</tbody>
</table>
\[
\frac{\bar{A} - \bar{B}}{2} e^{-B \sqrt{6}}
\]

is rather small. If it is neglected and \( \delta = 0 \), then

\[
\left( H + \frac{Z_b Y'_b}{Y'_t} \right) \frac{2}{\bar{A} + \bar{B}} = e^{B \sqrt{6}} \tag{41}
\]

and so an approximation of the berm length is

\[
B = \frac{1}{\sqrt{6}} \ln \left[ \left( H + \frac{Z_b Y'_b}{Y'_t} \right) \frac{2}{\bar{A} + \bar{B}} \right] \tag{42}
\]

as shown in the following tabulation.

<table>

</table>

19. The uplift, \( h_x \), at the base of the top, semipervious blanket can be obtained from Equation 33. (Note that \( x \) is negative and that \( x = 0 \) is at the landside berm toe.)

\[
h_x = \left( h_a + \frac{Z_b Y'_b}{Y'_t} \right) \cosh (x \sqrt{6}) - \frac{h_a}{L_{LS} \sqrt{6}} \sinh (x \sqrt{6}) - \frac{Z_b Y'_b}{Y'_t} \tag{43}
\]
The berm thickness at point \(-x\) can be obtained from Equation 17 so that

\[
 t_x = \frac{h_x F - Z_b \gamma'_b}{\gamma_w F + \gamma'_t} \tag{44}
\]

For a safety factor equal to 1.5 and noting that \(x\) is negative, the following tabulation for \(t_x\) represents the data from the example above.

<table>
<thead>
<tr>
<th>(x), ft</th>

</table>

**Case IV - Permeability of Seepage Berm**

**Equal to That of Top Blanket**

20. The origin of the \(x\) coordinate is taken at the landside seepage berm toe with a positive direction towards the river. The factor of safety against seepage uplift is assumed to be a constant \(F\) (Equation 17). The seepage gradient, \(i\), is expressed as

\[
i = \frac{h_x - t_x}{t_x + Z_b} \tag{45}
\]

The differential equation relating the flow up through the combined top blanket and seepage berm to that flowing horizontally through the pervious foundation (note that \(k_b = k_t\)) is

\[
k_b D \frac{d^2h}{dx^2} = k_b \left( \frac{h_x - t_x}{t_x + Z_b} \right) = k_b i \tag{46}
\]

If the buoyant unit weight of the top blanket, \(\gamma'_b\), is equal to that of
the seepage berm, $\gamma'_t$, then the safety factor of the combined berm and top blanket is written as

$$F = \frac{\gamma'_b (t_x + \beta_b)}{\gamma_w (h_x - t_x)}$$  \hfill (47)

Thus, Equation 46 can be rewritten as

$$\frac{d^2 h}{dx^2} = \frac{k_b \gamma'_b}{D_w} = \theta_1$$  \hfill (48)

If the buoyant weight of the berm is less than that of the top blanket ($\gamma'_t < \gamma'_b$), then with a constant seepage gradient upward through the top blanket and berm ($k_b = k_t$), the uplift safety factor for the berm only is

$$F = \left( \frac{Z_b + t_x}{h_x - t_x} \right) \frac{\gamma'_t}{\gamma'_w}$$  \hfill (49)

and

$$\frac{h_x - t_x}{Z_b + t_x} = \frac{\gamma'_t}{\gamma'_w}$$  \hfill (50)

so that

$$\frac{d^2 h}{dx^2} = \frac{k_b \gamma'_t}{k_f D_w} = \theta_2$$  \hfill (51)

where $\theta_1$ and $\theta_2$ are constants such that

$$\theta_2 = \theta_1 \frac{\gamma'_t}{\gamma'_b}$$

The solution of Equation 48 is

$$\frac{dh}{dx} = \theta_1 x + C_1$$  \hfill (52)

At $x = 0$
\[ \frac{dh}{dx} = C_1 = \frac{h_a}{L_{LS}} \]

where \( L_{LS} \) is the effective length of the top blanket landward of the seepage berm landside toe. Thus

\[ \frac{dh}{dx} = \theta_1 x + \frac{h_a}{L_{LS}} \] (53)

Integrating again

\[ h_x = \theta_1 \frac{x^2}{2} + \frac{h a}{L_{LS}} + C_2 \] (54)

At \( x = 0 \), \( h = h_a = C_2 \) so that

\[ h_x = \theta_1 \frac{x^2}{2} + \frac{h a}{L_{LS}} + h_a \] (55)

and by inserting the values of \( \theta_1 \) and \( h_a \) in Equation 55

\[ h_x = \frac{k_b y_b' x^2}{2k_f D_y F} + \frac{Z_b y_b' x}{\gamma_w F L_{LS}} + \frac{Z_b y_b'}{\gamma_w F} \] (56)

At \( x = B \), \( h = h_t \) so that

\[ h_t = \frac{k_b y_b' B^2}{2k_f D_y F} + \frac{Z_b y_b' B}{\gamma_w F L_{LS}} + \frac{Z_b y_b'}{\gamma_w F} \] (57)

Now at \( x = B \), the slope of the piezometric profile is

\[ \frac{dh}{dx} = \frac{k_b y_b' B}{k_f D_y F} + \frac{Z_b y_b'}{\gamma_w F L_{LS}} = \frac{H - h_t}{x + L_2} \] (58)

so that the uplift head, \( h_t \), is

\[ h_t = H - \frac{k_b y_b' B (x + L_2)}{k_f D_y F} - \frac{Z_b y_b' (x + L_2)}{\gamma_w F L_{LS}} \] (59)
By equating the expression above and the Equation 57 the value of $B$ may be written as

$$B = \left( \bar{x} + L_2 + L_{LS} \right) \left[ -1 + \sqrt{1 + \frac{2H_{wFL_{LS}}^2}{\gamma_b'Z_b}\left( \frac{x + L_2 + L_{LS}}{\bar{x} + L_2 + L_{LS}} \right)^2} - \frac{2L_{LS}}{\bar{x} + L_2 + L_{LS}} \right]$$  \hspace{1cm} (60)

If the buoyant weight of the seepage berm is less than that of the top blanket, the expression $\theta_2$ should be used rather than $\theta_1$. This requires the use of $\gamma'_t$ in Equation 60 rather than $\gamma'_b$. Use the data from the Case I example (see paragraph 5) to obtain

$$B = 642.1 \left( -1 + \sqrt{1.45518934F + 0.3035352749} \right)$$

as shown in the following tabulation.

<table>
<thead>
<tr>
<th>Safety Berm Factor $F$</th>
<th>Berm Length $B$, ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0</td>
<td>209</td>
</tr>
<tr>
<td>1.1</td>
<td>244</td>
</tr>
<tr>
<td>1.2</td>
<td>277</td>
</tr>
<tr>
<td>1.3</td>
<td>309</td>
</tr>
<tr>
<td>1.4</td>
<td>340</td>
</tr>
<tr>
<td>1.5</td>
<td>370</td>
</tr>
</tbody>
</table>

21. The uplift at the base of the top semipervious blanket, $h_x$, referred to the upper surface of the blanket may be obtained using Equation 56. The thickness of the seepage berm, $t_x$ at point $x$, may be computed as indicated below. The uplift safety factor, $F$, is given by Equation 17 so that

$$t_x = \frac{h_x - \frac{Z_b'\gamma'_b}{\gamma'_w F}}{1 + \frac{\gamma_b'}{\gamma'_w F}}$$  \hspace{1cm} (61)
22. Use the data from the Case I example with the safety \( F = 1.2 \) and \( B = 277 \) ft. Then Equation 56 becomes

\[
\frac{h_x}{l} = \frac{1 \times x^2}{2 \times 1 \times 1.2 \times 200 \times 50} + \frac{5 \times 1 \times x}{1 \times 1.2 \times 223.6} + \frac{5 \times 1}{1 \times 1.2}
\]

and Equation 61 is

\[
t_x = \frac{h_x - \frac{5 \times 1}{1 \times 1.2}}{\frac{1}{1.2} + 1} = \frac{1.2h_x - 5}{1.2 + 1} = \frac{6h_x - 25}{11}
\]

as shown in the following tabulation.

<table>
<thead>
<tr>

</tbody>
</table>

Case V - Semipervious Seepage Berm

23. It is assumed for this case that the vertical permeability of the seepage berm, \( k_t \), is equal to or less than that of the semipervious top blanket and that the horizontal permeabilities of both the seepage berm and semipervious top blanket are zero. The \( x \) coordinate system is zero at the landside toe of the seepage berm, and the positive direction is riverward.

24. When seepage flows perpendicular to soil layers 1 and 2, it is helpful to express the thickness of one layer so that it has a thickness-permeability relationship such that a common permeability coefficient may be used. Thus, if layer 1 has \( k_1 \) and \( z_1 \) and layer 2
has $k_2$ and $z_2$, then the equivalent thickness of $z_2$, using $k_1$ in lieu of $k_2$, is

$$z_2' = \frac{z_2 k_1}{k_2}$$

or the equivalent thickness of layer 1, using $k_2$ for both layers, is

$$z_1' = \frac{z_1 k_2}{k_1}$$

The thickness of the top blanket, $z_b'$, can be expressed as $z_b'$, to permit the use of the seepage berm permeability.

$$z_b' = \frac{z_b k_t}{k_b} \quad (62)$$

The differential equation for this case is

$$k_f D \frac{d^2 h}{dx^2} = \frac{k_t (h_x - t_x)}{z_b' + t_x} \quad (63)$$

Rewrite Equation 63 so that

$$\frac{d^2 h}{dx^2} = \frac{k_t}{k_f D} \left( \frac{h_x - t_x}{z_b' + t_x} \right) \quad (64)$$

The seepage gradient up through the berm and the equivalent top blanket is

$$i = \frac{h_x - t_x}{t_x + \frac{z_b' k_t}{k_b}} \quad (65)$$

The uplift safety factor in the seepage berm only is a constant $F$.

Then

$$F = \frac{\gamma_b'}{\gamma_w} \quad (66)$$
where

\[ i = \frac{\gamma'_t}{\gamma'_w} \]

so that

\[ \frac{d^2 h}{dx^2} = \frac{k_t}{k_f} i = \frac{k_t \gamma'_t}{k_f \gamma'_w} = 0 \]  \hspace{1cm} (67)

Integrating

\[ \frac{dh}{dx} = 6x + C_1 \]  \hspace{1cm} (68)

\[ h_x = \frac{6x^2}{2} + C_1 x + C_2 \]  \hspace{1cm} (69)

At \( x = 0 \), \( h = h_a = C_2 \) where \( h_a \) is the uplift head just under the semipervious top blanket. At \( x = 0 \) (using Equations 1 and 2)

\[ F = \frac{\gamma'_b Y_b}{\gamma'_w a} \]

\[ h_a = C_2 = \frac{\gamma'_b Y_b}{\gamma'_w} \]

Also at \( x = 0 \), the landside seepage gradient is

\[ \frac{dh}{dx} = \frac{h_a}{L_{LS}} \]  \hspace{1cm} (70)

where \( L_{LS} \) is the effective landside length of the top blanket measured landward from \( x = 0 \). Then at \( x = 0 \)

\[ \frac{dh}{dx} = 0 \times 0 + C_1 = \frac{h_a}{L_{LS}} = \frac{Z_b \gamma'_b}{\gamma'_w F_{LS}} \]  \hspace{1cm} (71)

so that the uplift head at point \( x \) at the base of the top blanket is

\[ h_x = \frac{k_t \gamma'_t x^2}{2k_f \gamma'_w F} + \frac{Z_b \gamma'_b x}{\gamma'_w F_{LS}} + \frac{Z_b \gamma'_b}{\gamma'_w} \]  \hspace{1cm} (72)
At \( x = B \) (landside levee toe), the seepage uplift at the base of the top blanket is

\[
h_t = \frac{k_t y'_t B^2}{2k_f D y'_w} + \frac{Z_b y'_b}{\gamma_w F L_S} + \frac{Z_b y'_b}{\gamma_w F}
\]  

(73)

Also at \( x = B \), the seepage gradient in the pervious foundation is

\[
\frac{H - h_t}{X + L_2} = \frac{k_t y'_t B}{k_f D y'_w} + \frac{Z_b y'_b}{\gamma_w F L_S}
\]  

(74)

and so

\[
h_t = H - \frac{Z_b y'_b (X + L_2)}{\gamma_w F L_S} - \frac{k_t y'_t B (X + L_2)}{\gamma_w D P k_f}
\]  

(75)

Equate Equations 73 and 75 to obtain

\[
B = \left( \frac{k_b y'_b L S}{k_t y'_t} + \frac{X + L_2}{X + L_2} \right) \left[ -1 + \sqrt{1 + (\ldots)} \right]
\]  

(76)

where

\[
(\ldots) = \left[ \frac{2 H y'_w k_b}{y'_t k_t} - \frac{y'_b k_b}{y'_t k_t} \left( \frac{X + L_2 + L_{LS}}{L_{LS}} \right) \right]
\]

(77)

If \( y'_b = y'_t \) and \( k_b = k_t \), Equation 76 becomes Equation 60.

25. Use data from the Case I example (see paragraph 5) to obtain the following tabulation with

\[
\bar{K} = \frac{k_t}{k_b}
\]

where \( \bar{K} \) equals the ratio of the seepage berm permeability to that of the top blanket.

26. For the small values of K, the values of B from the tabulation above are equal to those in the tabulation on page 11; when K is unity, the values of B equals those in the tabulation on page 26. Using a concept introduced by Polubarinova-Kochina, write

\[
\tan \left( \frac{\pi \epsilon}{2} \right) = \sqrt{\frac{k_B}{k_t}} = \frac{1}{\sqrt{K}}
\]  

so that

\[
\epsilon = \frac{1}{\pi} \arctan \left( \frac{1}{\sqrt{K}} \right)
\]

as shown in the following tabulation.

<table>

27. Having selected an uplift safety factor, $F$, for the seepage berm and having determined the berm length, $B$, the uplift head, $h_x$, at the base of the semipervious top blanket, (referenced to the upper surface of the blanket) can be determined using Equation 72. The seepage head at the base of the seepage berm, $h'_x$, (or the top of the semipervious top blanket) is found as follows:

$$\frac{h_x - t_x}{t_x + \frac{Z_b K}{t}} = \frac{h'_x - t_x}{t_x}$$

so that

$$h'_x - t_x = \frac{h_x - t_x}{1 + \frac{Z_b K}{t_x}}$$

The uplift safety factor for the seepage berm is a constant $F$. Then

$$F = \frac{t_x y'_t}{(h'_x - t_x) y_w}$$

so that

$$h'_x - t_x = \frac{t_x y'_t}{y_w F}$$

28. Equate Equations 81 and 83 to obtain the following expression for the berm thickness at point $x$

$$h_x = \frac{Z_b y'_t K}{y_w F}$$

$$t_x = \frac{y'_t}{1 + \frac{y'_t}{y_w F}}$$

Using the data from the example presented in Case I with $F = 1.2$, $K = 1.0$, and $B = 277$ ft, Equation 72 is
\[ h_x = \left( \frac{1}{200 \times 50 \times 1 \times 1.2 \times 2} \right) x^2 + \left( \frac{1 \times 5}{1 \times 1.2 \times 223.6} \right) x + \frac{1 \times 5}{1 \times 1.2} \]

and

\[ t_x = \frac{h_x - \frac{5 \times 1 \times 1}{1 \times 1.2}}{1 + \frac{1}{1 \times 1.2}} = \frac{1.2h_x - 5}{2.2} \]

\[ = \frac{6h_x}{11} - \frac{25}{11} \]

as given in the following tabulation, which agrees with values in the tabulation on page 27.

<table>
<thead>
<tr>

<td>4.6</td>
</tr>
</tbody>
</table>

29. As another example, assume that \( F = 1.2 \), \( K = 0.00001 \), and \( B = 968 \) ft. Then

\[ h_x = \left( \frac{1}{100,000 \times 200 \times 50 \times 1 \times 1.2 \times 2} \right) x^2 + \left( \frac{1 \times 5}{1 \times 1.2 \times 223.6} \right) x + \frac{1 \times 5}{1 \times 1.2} \]
\[ t_x = \frac{ h_x - \frac{5 \times 1 \times 1}{1 \times 100,000 \times 1.2}}{1 + \frac{1}{1 \times 1.2}} \]

\[ = \frac{1.2h_x}{2.2} - \frac{5}{2.2 \times 100,000} \]

\[ = \frac{6h_x}{11} - \frac{25}{1,100,000} \approx \frac{6h_x}{11} \]

The following tabulation is obtained for \( h_x \) and \( t_x \) (see tabulation on page 11).

</table>

30. The results of the examples given in the two previous tabulations (see page 31 (bottom) and the one above) represent the extremes for \( K = 1 \) and \( \bar{K} \) equal to a very small value. A third case is given where \( F = 1.2, \bar{K} = 0.1, \) and \( B = 718 \) ft. Then

\[ h_x = \left( \frac{1}{10 \times 200 \times 50 \times 1 \times 1.2 \times 2} \right) x^2 + \left( \frac{1 \times 5}{1 \times 1.2 \times 223.6} \right) x + \frac{1 \times 5}{1 \times 1.2} \]

\[ t_x = \frac{h_x - \frac{5 \times 1 \times 1}{1 \times 10 \times 1.2}}{1 + \frac{1}{1 \times 1.2}} = \frac{1.2h_x}{2.2} - \frac{5}{2.2 \times 10} = \frac{6h_x}{11} - \frac{2.5}{11} \]
with $h_x$ and $t_x$ given in the following tabulation.

</tbody>
</table>

31. The development above is for the case where the uplift safety factor of the seepage berm only is considered. If the uplift safety factor of the combined seepage berm and semipervious top blanket is developed, then the basic differential equation is that given by Equation 119 which can be solved using Equation 121, the finite difference method. Setting $\overline{K} = k_t/k_b$, the uplift safety factor of the seepage berm, $F_t$, and that for the combined seepage berm and the semipervious top blanket, $F_{t+b}$, then becomes

$$\frac{F_t}{F_{t+b}} = \frac{t_x + Z_b \overline{K}}{t_x + \frac{Z_b \gamma_b}{\gamma_t}}$$

If

$$\overline{K} \geq \frac{\gamma_b}{\gamma_t}$$

then

$$F_t \geq F_{t+b}$$
Case VI - Variable Uplift Safety Factor

32. For this case, it is assumed that the uplift factor is $F_0$ at the landside levee toe and varies in a linear manner to a lower value $F_B$ at the landside berm toe. The $x$ coordinate system has its origin at the levee toe and is positive landward. The berm width is $B$. The uplift safety factor at point $x$ is as follows: If $k_t < k_b$, then the basic differential equation (Equation 64) is

$$\frac{d^2 h}{dx^2} = \frac{k_t (h_x - t_x)}{k_b (Z_b k_t + t_x)}$$

The upward seepage through the top semipervious blanket and seepage berm has a gradient (Equation 65) in the berm of

$$i = \frac{h_x - t_x}{t_x + \frac{Z_b k_b}{k_b}}$$

The seepage uplift safety factor for the berm only is

$$F = \frac{\gamma'_t}{\gamma'_w} = F_0 - \frac{(F_0 - F_B)}{B} \frac{X}{B}$$

(Equation 85)

Combining Equations 65 and 85

$$\frac{h_x - t_x}{t_x + \frac{Z_b k_b}{k_b}} = \frac{\gamma'_t}{\gamma'_w} \left[ \frac{1}{F_0 - \frac{(F_0 - F_B)}{B} \frac{X}{B}} \right]$$

(Equation 86)

and Equation 64 becomes

$$\frac{d^2 h}{dx^2} = \frac{k_t \gamma'_t}{k_b \gamma'_w} \left[ F_0 - \frac{(F_0 - F_B)}{B} \frac{X}{B} \right]$$

(Equation 87)

Set

$$\phi = F_0 - \frac{(F_0 - F_B)}{B} \frac{X}{B}$$
then

\[ d\phi = - (F_o - F_B) \frac{dx}{B} \]

and

\[ dx = \frac{-Bd\phi}{F_o - F_B} \]

so that

\[ (dx)^2 = \frac{B^2(d\phi)^2}{(F_o - F_B)^2} \]

Equation 87 rewritten is

\[ \frac{d^2h}{dx^2} = \frac{k_tY_t'}{k_fD_fY_w'} = \frac{d^2h (F_o - F_B)^2}{B^2d\phi^2} \]

(88)

and so

\[ \frac{d^2h}{d\phi^2} = \left[ \frac{k_tY_t'B^2}{k_fD_fY_w'(F_o - F_B)^2} \right] \frac{1}{\phi} = \frac{\theta}{\phi} \]

(89)

where

\[ \theta = \left[ \frac{k_tY_t'B^2}{k_fD_fY_w'(F_o - F_B)^2} \right] \]

(90)

Equation 89 can be integrated

\[ \frac{dh}{d\phi} = \theta \ln \phi + C_1 \]

(91)

so that

\[ \frac{dh}{d\phi} = - \frac{Bdh}{(F_o - F_B)} \frac{dx}{dx} = \theta \ln \left[ F_o - (F_o - F_B) \frac{X}{B} \right] + C_1 \]

(92)
and

\[ \frac{dh}{dx} = - \left( F_o - F_B \right) \frac{\theta}{B} \ln \left[ \frac{F_o - (F_o - F_B) x}{B} \right] - C_1 \frac{(F_o - F_B)}{B} \]  \hspace{1cm} (93)

at \( x = B \), \( \phi = F_B \) and \( \frac{dh}{dx} = - \frac{h_B}{L_{LS}} \), then

\[ C_1 = \frac{h_B}{L_{LS} (F_o - F_B)} - \theta \ln F_B \] \hspace{1cm} (94)

Equation 91 can be reexpressed as

\[ \frac{dh}{d\phi} = \theta \ln \phi + \frac{h_B}{L_{LS} (F_o - F_B)} - \theta \ln F_B \] \hspace{1cm} (95)

which, upon integration, is

\[ h_x = \theta \left[ \phi \ln \phi - \phi - \phi \ln (F_B) \right] + \frac{h_B \phi}{L_{LS} (F_o - F_B)} + C_2 \] \hspace{1cm} (96)

At \( x = B \), \( \phi = F_B \) and \( h = h_a \), then

\[ h_a = \theta \left[ F_B \ln (F_B) - F_B - F_B \ln (F_B) \right] + \frac{h_B F_B}{L_{LS} (F_o - F_B)} + C_2 \] \hspace{1cm} (97)

so that

\[ C_2 = h_a + F_B \theta - \frac{h_B F_B}{L_{LS} (F_o - F_B)} \] \hspace{1cm} (98)

Thus, Equation 96 becomes

\[ h_X = \theta \left[ F_o \ln \left( \frac{F_o}{F_B} \right) - F_o + F_B \right] + \frac{h_B (\phi - F_B)}{L_{LS} (F_o - F_B)} + h_a \] \hspace{1cm} (99)

At \( x = 0 \), \( \phi = F_o \) and \( h = h_t \), then

\[ h_t = \theta \left[ F_o \ln \left( \frac{F_o}{F_B} \right) - F_o + F_B \right] + h_a \left( \frac{B + L_{LS}}{L_{LS}} \right) \] \hspace{1cm} (100)
Also at \( x = 0 \)

\[
\frac{dh}{dx} = - \frac{H - h_t}{X + L_2}
\]

Now, substitute Equation 94 into Equation 93 to obtain

\[
\frac{dh}{dx} = - \frac{(F_o - F_B) \frac{\theta}{B} \ln \left( \frac{F_o}{F_B} \right) - \frac{1}{F_B} \frac{h_a}{L_{LS}}}{X + L_2}
\]  

(101)

At \( x = 0 \), \( F_o - (F_o - F_B) \frac{X}{B} = F_o \) and \( h_x = h_t \), then

\[
\frac{dh}{dx} = - \frac{H - h_t}{X + L_2} = - \left[ (F_o - F_B) \frac{\theta}{B} \ln \left( \frac{F_o}{F_B} \right) \right] - \frac{h_a}{L_{LS}}
\]

(102)

and \( h_t \) may be expressed as

\[
h_t = H - (X + L_2) (F_o - F_B) \frac{\theta}{B} \ln \left( \frac{F_o}{F_B} \right) - (X + L_2) \frac{h_a}{L_{LS}}
\]

(103)

Equating Equations 100 and 103 results in

\[
\frac{k_t \gamma^t y}{k_t \rho y} \left[ F_o \ln \left( \frac{F_o}{F_B} \right) - F_o + F_B \right] + \frac{h_a}{L_{LS}} (E + L_2) \frac{h_a}{L_{LS}}
\]

\[
= H - (X + L_2) \left[ \frac{k_t \gamma^t}{k_t \rho y} \left( \frac{F_o}{F_B} \right) \ln \left( \frac{F_o}{F_B} \right) \right]
\]

\[
- (X + L_2) \frac{h_a}{L_{LS}}
\]

(104)

At \( x = B \)

\[
F_B = \frac{Z_b \gamma^t}{h_a \gamma_w} \text{ and } h_a = \frac{Z_b \gamma^t}{\gamma_w F_B}
\]

Equation 104 may be expressed as
\[ B^2 \left( \frac{F_0}{(F_0 - F_B)^2} \ln \left( \frac{F_0}{F_B} \right) - \frac{1}{F_0 - F_B} \right) + B \left( \frac{X + L_2}{F_0} - \frac{1}{F_0 - F_B} \ln \left( \frac{F_0}{F_B} \right) \right) + \frac{L_{LS} \gamma_b L_b}{F_B \gamma_t^2} + \left( \frac{\gamma_b L_b}{F_B \gamma_t^2} \right) (X + L_2 + L_{LS}) - \frac{H L^2_{LS} \gamma_b \gamma_k t}{Z_b \gamma_t^2} = 0 \] (105)

33. Set

\[ \overline{A} = \left[ \frac{F_0}{(F_0 - F_B)^2} \ln \left( \frac{F_0}{F_B} \right) - \frac{1}{F_0 - F_B} \right] \]

\[ \overline{C} = \left[ \frac{X + L_2}{F_0} \ln \left( \frac{F_0}{F_B} \right) + \frac{\gamma_b L_b}{F_B \gamma_t^2} \right] \]

\[ \overline{D} = \left[ \frac{\gamma_b L_b}{F_B \gamma_t^2} (X + L_2 + L_{LS}) - \frac{H L^2_{LS} \gamma_b \gamma_k t}{Z_b \gamma_t^2} \right] \]

Then Equation 105 can be expressed as

\[ B^2 \overline{A} + BC + \overline{D} = 0 \] (106)

The solution for the berm width, \( B \), is

\[ B = \frac{\overline{C}}{2\overline{A}} \left( -1 + \sqrt{1 - \frac{4\overline{AD}}{\overline{C}^2}} \right) \] (107)

Using data previously presented in Case I example (see paragraph 5) with \( F_B = 1 \) and \( K = k_t/k_b \), the berm lengths for various \( K \) and the safety factors at the levee toe are as shown in the following tabulation.

<table>
<thead>
<tr>
<th>Safety Factor</th>
<th>Berm Length, ( B ), ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>( F_0 )</td>
<td>( K = 1 )</td>
</tr>

</tr>
<tr>
<td>1.1</td>
<td>215.2</td>
</tr>
</tbody>
</table>

(Continued)
From Equation 86 the expression for the variation in the thickness, $t_x$, of the seepage berm is written as

$$h_x - t_x = \frac{\gamma'_t}{\gamma_w} \left[ \frac{t_x + Z_b \bar{K}}{F_o - (F_o - F_B) \frac{X}{B}} \right]$$

$$= \frac{\gamma'_t t_x}{\gamma_w \left[ F_o - (F_o - F_B) \frac{X}{B} \right]} + \frac{\gamma'_t Z_b \bar{K}}{\gamma_w \left[ F_o - (F_o - F_B) \frac{X}{B} \right]} \quad (108)$$

$$h_x - \frac{\gamma'_t Z_b \bar{K}}{\gamma_w \left[ F_o - (F_o - F_B) \frac{X}{B} \right]} = t_x \left\{ 1 - \frac{\gamma'_t}{\gamma_w \left[ F_o - (F_o - F_B) \frac{X}{B} \right]} \right\} \quad (109)$$

$$t_x = \frac{h_x - \frac{\gamma'_t Z_b \bar{K}}{\gamma_w \left[ F_o - (F_o - F_B) \frac{X}{B} \right]}}{\left( 1 + \frac{\gamma'_t}{\gamma_w} \right) \left[ \frac{1}{F_o - (F_o - F_B) \frac{X}{B}} \right]} \quad (110)$$

The value of $h_x$ at point $x$ is obtained from Equation 95. Then
Using the same data as given in Case I example: \( F = 1.5 , \ F_B = 1.0 \), \( B = 235.3 \), and \( K = k_t/k_b = 1.0 \), Equation 110 becomes

\[
h_x = \frac{K Y_B^2 k_b}{k_t D Y_w (F_o - F_B)^2} \left\{ \frac{F_o - (F_o - F_B) X}{B} \frac{X}{B} \right\}
\times \ln \frac{F_o - (F_o - F_B) X}{B_B} - \frac{F_o - (F_o - F_B) X}{B_B} + F_B
\]

\[
+ \frac{Z_b Y_b'}{Y_w F_B} \left( 1 + \frac{B}{L_{LS} (F_o - F_B)} \right) (111)
\]

With values of \( h_x \) and \( t_x \) given in the following tabulation.
### Case VII - Pervious Seepage Berm

34. For this case, the vertical permeability of the berm is equal to or larger than that of the top, semipervious blanket. As with most of the other cases, the horizontal permeability of the seepage blanket is assumed to be zero. The origin of the x coordinate system is at the landside toe of the seepage berm and is positive towards the river. The basic differential equation is

\[
k_z D \frac{d^2 h}{dx^2} = \frac{k_b (h_x - t_x)}{Z_b + \frac{t_x}{K}}
\]

where the effective thickness of the seepage berm in regards to seepage is

\[
t_x = \frac{k_b}{k_t} = \frac{t_x}{K}
\]

Therefore,

\[
\frac{d^2 h}{dx^2} = \frac{k_b}{k_b DZ_b} \left( \frac{h_x - t_x}{t_x \left( 1 + \frac{t_x}{Z_b K} \right)} \right)
\]

35. It is assumed that the uplift safety factor for the top blanket and the seepage berm combined is a constant $F$. Then
\[ F = \frac{Z_b y'_b + t x y'_t}{(h_x - t_x) \gamma_w} \]  \hspace{1cm} (115)

and

\[ h_x - t_x = \frac{Z_b y'_b + t x y'_t}{\gamma_w F} \]  \hspace{1cm} (116)

\[ h_x - \frac{Z_b y'_b}{\gamma_w F} = t_x \left(1 + \frac{\gamma'_t}{\gamma'_w F}\right) \]  \hspace{1cm} (117)

\[ t_x = \frac{h_x - \frac{Z_b y'_b}{\gamma'_w F}}{1 + \frac{\gamma'_t}{\gamma'_w F}} \]  \hspace{1cm} (118)

Equation 114 can be rewritten as

\[ \frac{d^2 h}{dx^2} = \frac{c^2 \left( h_x + \frac{Z_b y'_b}{\gamma'_t} \right)}{\gamma'_w F h_x + \gamma'_t F + 1 - \frac{\gamma'_b}{\gamma'_t K}} \]  \hspace{1cm} (119)

The author was not able to solve Equation 119, and so he resorted to a numerical method (finite difference) to solve it.

36. If \( K \) approaches infinity, then Equation 119 becomes Equation 19. If \( K = 1 \) and \( \gamma'_b/\gamma'_t = 1.0 \), then Equation 119 becomes Equation 52. If \( K = 1.0 \) and \( \gamma'_b/\gamma'_t \neq 1.0 \), then Equation 119 becomes Equation 67.

37. To convert Equation 119 for the numerical method, approximate

\[ \frac{d^2 h}{dx^2} \approx \frac{h_3 - 2h_2 + h_1}{\Delta x^2} \]  \hspace{1cm} (120)
where

\[ h_1 = \text{uplift head at the base of the semipervious top blanket at } x = (n - 1)\Delta x \text{ (Figure 2)} \]

\[ h_2 = \text{uplift head at the base of the semipervious top blanket at } x = n\Delta x \]

\[ h_3 = \text{uplift head at the base of the semipervious top blanket at } x = (n + 1)\Delta x \]

\[ \Delta x = \text{increment of horizontal distance} \]

38. In general, \( h_1 \) and \( h_2 \) are known for a given safety factor, etc. Then \( h_3 \) can be solved by using the following expression

\[
h_3 = 2h_2 - h_1 + \left[ \frac{c^2\Delta x^2}{2} \left( h_2 + \frac{\gamma_b \gamma'_b}{\gamma'_t} \right) \right]
\]

(121)

39. From Equation 2, the uplift head at the base of the top blanket at the landside seepage berm toe is

\[ h_a = \frac{\gamma'_b \gamma_b}{\gamma'_w} \]

The gradient landward at this location is \( h_a / L_L S \). These are boundary conditions that must be considered in applying the numerical method of solution. As shown in Figure 3, the initial value of \( h_1 \) is \( h_a \).

The initial value of \( h_2 \) is

\[
h_2 = \frac{Z_b \gamma'_b}{\gamma'_w} \left( \frac{\Delta x}{L_L S} + 1 \right) + \frac{c^2\Delta x^2Z_b \gamma'_b}{2\gamma'_w} \]

(122)

The initial value of \( h_3 \) may then be computed using \( h_a \) and \( h_2 \) and Equation 121. This procedure is used to obtain the next value of \( h_3 \) with \( h_2 \) becoming \( h_1 \) and \( h_3 \) becoming \( h_2 \). The procedure is repeated across the base of the seepage berm for each increment, \( \Delta x \).

At the landside levee toe, another boundary condition must be met. This condition, the seepage gradient in the pervious foundation, is expressed as
Figure 2. Derivation of uplift head at the base of the semipervious top blanket at \( x = (n + 1)\Delta x \)

\[
Q_1 - Q_2 - Q_3 = 0
\]

\[
Q_1 = \frac{k_B D (h_3 - h_2)}{\Delta x}, \quad Q_2 = \frac{k_B D (h_2 - h_1)}{\Delta x}
\]

\[
Q_3 = \frac{k_B Z_B \left( h_2 + \frac{Z_B \gamma_b'}{\gamma_1'} \right) \Delta x}{\gamma_w F h_2 + \gamma_w F + 1 - \frac{\gamma_b}{\gamma_1' K}}
\]

\[
h_3 = 2h_2 - h_1 + \frac{c^2 \Delta x^2 \left( h_2 + \frac{Z_B \gamma_b'}{\gamma_1'} \right)}{\gamma_w F h_2 + \gamma_w F + 1 - \frac{\gamma_b}{\gamma_1' K}}
\]
Figure 3. Derivation of initial value of uplift head at the base of the semipervious top blanket near berm toe
where

\[ i = \frac{H - h_t}{\bar{X} + L_2} \]  

(123)

\[ H = \text{head on the system} \]

\[ h_t = \text{uplift head at the base of the top blanket at the landside levee toe} \]

\[ \bar{X} = \text{effective length of the riverside blanket} \]

\[ L_2 = \text{levee base width} \]

40. The value of \( H \) is computed as shown in Figure 4 for each new value of \( h_3 \) using the following expression

\[ H = h_3 \left( 1 + \frac{\bar{X} + L_2}{\Delta x} \right) - h_2 \left( \frac{\bar{X} + L_2}{\Delta x} \right) + \frac{c^2 \Delta x}{2} \left( \frac{h_3 + \frac{z_b \gamma'_b}{\gamma'_t}}{\gamma'_w^F \gamma'_w + \gamma'_t} + \frac{\bar{X} + L_2}{\gamma'_t K} \right) \]  

(124)

A calculated value of \( H \) that is generally less than the given value of \( H \) indicates that the number of increments, \( n \Delta x \), used is not equal to \( B \), the seepage berm width. After a number of steps, a calculated value of \( H \) that exceeds the given value of \( H \) indicates that the sum of \( n \Delta x \) is larger than \( B \). The values of \( B \) and \( h_t \) are then found by interpolation.

41. The thickness of the seepage berm, \( t_x \), is calculated for \( \Delta x \) using \( h_3 \).

\[ t_x = \frac{h_3 \gamma'_w^F - z_b \gamma'_b}{\gamma'_w^F + \gamma'_t} \]  

(125)

Using the data as given in the examples presented in Case I (see paragraph 5) with \( K = 1.0 \), \( F = 1.0 \), and \( \Delta x = 10 \text{ ft} \), then

\[ h_n = \frac{1 \times 5}{1} = 5 = h_{11} \]
\[ Q_1 - Q_2 - Q_3 = 0 \]

\[ Q_1 = \frac{k_p D (H - h_1)}{(X + L_2)} , \quad Q_2 = \frac{k_p D (h_t - h_2)}{\Delta x} \]

\[ Q_3 = \frac{\Delta x k_b}{2} \frac{Z_b \gamma'_b}{Z_b K} + \frac{Z_b \gamma'_b}{\gamma'_t K} \]

\[ H = h_t \left( 1 + \frac{X + L_2}{\Delta x} \right) - h_2 \left( \frac{X + L_2}{\Delta x} \right) \]

\[ + \left( \frac{X + L_2}{\Delta x} \right) \frac{\Delta x^2 c^2}{2} \frac{Z_b \gamma'_b}{\gamma'_t K} \]

\[ + \frac{\gamma_w F h_t}{\gamma'_t K} + \frac{\gamma_w F}{\gamma'_t K} + 1 - \frac{Z_b \gamma'_b}{\gamma'_t K} \]

Figure 4. Derivation of head on system for semipervious berm
\[
h_{2i} = 5 \left( \frac{10}{223.6} + 1 \right) + \frac{100 \times 5}{2 \times 50,000} = 5.22862396
\]

\[
h_3 = 2h_2 - h_1 + \frac{100}{50,000} \frac{h_2 + 5}{h_2 + 1} = 2h_2 - h_1 + 0.01
\]

\[
H = h_3 \left( 1 + \frac{218.5 + 200}{10} \right) - h_2 \left( \frac{218.5 + 200}{10} \right)
\]
\[+ \frac{218.5 + 200}{10} \times \frac{10}{2 \times 50,000} \frac{h_3 + 5}{h_3 + 1} = 42.85h_3 - 11.85 + 0.20925
\]
\[+ \frac{1 \times 1 \times h_3}{5 \times 1} + (1 \times 1) + 1 - (1 \times 1)
\]

Values of \( t_x, H, \) and \( B_x \) are given in the following tabulation.

</tbody>
</table>

* 5 = h_{1i}

** 5.229 = h_{2i}
42. The last increment in the tabulation above is too large; the corrected increment, $\delta$, is \( \frac{30 - 29.20}{30.05 - 29.20} \times 10 = 9.4 \text{ ft} \). The berm width, $B$, is \( 200 + 9.4 = 209.4 \text{ ft} \). The seepage berm thickness, $t$, at the landside levee toe for $B$ is

\[
\frac{9.4}{10} = \frac{x - 3.24}{3.45 - 3.24}
\]

\( 0.94 \times 0.21 + 3.24 = 3.44 \text{ ft} \)

It should be noted that $B_x$ is 20 ft for the initial $h_3$, and

\[
t_x = \frac{h_3 - 5}{1 + 1} = \frac{h_3}{2} - 2.5
\]

43. Also, note that for $K$ equal to or larger than one, the theoretical berm thickness at the landside berm toe is zero. For $K$ less than one, then the berm thickness at the landside toe is finite.

44. For $K$ equal to 10 or larger, the berm length is nearly equal to that for $K$ equal to infinity. The need to solve Equation 121 is academic and is not required for practical design.

45. The factor of safety, $F$, in Equation 105 has been assumed to be a constant. However, a safety factor can be used that is a function of $x$. A simple linear variation of the safety factor is

\[
F = F_B + (F_0 - F_B) \frac{X}{B}
\]

(126)

where

$F_0$ = uplift safety factor at the landside seepage berm toe ($x = 0$)

$F_B$ = uplift safety factor at the landside levee toe ($x = B$)

$B$ = length of the seepage berm

The difference in Equations 126 and 85 is caused by the different location of the $x$ origin.

46. Equation 126 can be inserted into Equation 121. The procedure is to estimate $B$ and then to proceed in a step-by-step manner.
using $Ax$ as selected. At $x$ equal to $B$, a determination of $H$, the net head acting upon the system, is made. If the computed $H$ is not equal to the actual $H$, then a new estimate of $B$ is made and a new value of $H$ determined. In general, this new value of $H$ will not be equal to the actual value of $H$, so a new estimate of $B$ is made and the procedure reiterated. Usually, two computed values of $H$ will permit a close estimation of $H$ and, thus, the needed value of $B$. If required, a plot of $B$ versus $H$ can be made, and the value of $B$ for the actual value of $H$ can be determined. Results of such a study are shown in Figure 5, where $F_0 = 1.0$ and $F_B = 1.5$ for the condition that the permeabilities of the seepage berm are equal to or larger than that of the top blanket, i.e. $K > 1$.

**Case VIII - General Case**

47. The previously presented cases have either a constant uplift safety factor or one that varies in a linear manner. For this case, it is assumed that the berm thickness is a function of $x$. The uplift safety factor is dependent upon the assumed berm thickness and, in general, it will not be a constant. The basic differential equation is based upon Equation 114.

$$\frac{d^2 h}{dx^2} = \frac{k_b}{k_l D Z_b} \left( \frac{h - t}{t_k k_b} \right) = \frac{k_b}{k_l D Z_b} \left[ \frac{h - f(x)}{1 + \frac{f(x)}{Z_b K}} \right] \quad (127)$$

48. No attempt has been made to solve Equation 125 in a formal manner; rather, the numerical method, as presented in Case VII, is used. The uplift head, $h_x$, at the base of the semipervious top blanket is computed in steps. The uplift safety factor is also computed for each step. If $k_t$ is less than $k_b$, the value of $F$ is found using the following expression, which applies only to the seepage berm. The seepage gradient up through the effective top blanket is (using Equation 65)
Figure 5. Relationship between seepage berm width and ratio of permeability of seepage berm to top blanket for various safety factors.
\[ i = \frac{h_x - t_x}{t_x + \frac{Z_b k_t}{k_b}} = \frac{h_x - t_x}{t_x + \frac{Z_b K}{k_b}} \]

The safety factor against seepage uplift is

\[ F = \frac{\gamma_t'}{\gamma_w} = \frac{\gamma_t'}{\gamma_w} \left( \frac{\frac{t_x + Z_b K}{h_x - t_x}}{1} \right) \]

(128)

If \( k_t \) is greater than \( k_b \), then

\[ F = \frac{\gamma_t'}{\gamma_w} \left( \frac{\frac{t_x + z_b y_b'}{h_x - t_x}}{1} \right) \]

(129)

If the uplift head at the base of the top blanket extends just to the upper surface of the seepage berm, then the safety factor is infinite. For cases in which the uplift head is below the upper surface of the seepage berm, the uplift safety factor is infinite and the basic differential Equation 127 is no longer valid. The seepage berm then becomes uneconomical; its thickness is excessive. In fact, to obtain economy, the uplift head at the base of the top blanket should always be above the upper surface of the seepage berm except for the exceptional case when the berm is constructed of very pervious soil.

Conclusions

49. A plot of the variation of the seepage berm width, \( B \), various values of the berm top blanket seepage ratio, \( \bar{K} \), and safety factors, \( F \), is presented in Figure 5. It should be noted that \( B \) is very sensitive to \( \bar{K} \) for values of \( \bar{K} \) less than 1.0 but not sensitive to \( \bar{K} \) for values of \( \bar{K} \) greater than 1.0. The curves in Figure 5 show the condition that the uplift safety factor varies in a uniform manner. For instance, if the uplift safety factor varies from 1.5 at the landside levee toe to 1.0 at the landside seepage berm toe, then the berm width is only slightly greater than that for a uniform safety factor.
of 1.0. Of course, near the levee the berm thickness is greater for the case where the uplift safety factor varies than that for a uniform condition of the uplift safety factor. Also shown is a curve where the uplift safety factor is infinite under the seepage berm but 1.0 at the landside berm toe. This condition exists when the piezometric profile for the head at the base of the top blanket coincides with the upper surface of the seepage berm. The berm width is the same as that for an impervious berm.

50. It should be noted that if the uplift safety factor is greater than 1.0 at the berm toe, then as the top blanket becomes less thick, the berm width becomes longer and for thin top blankets the berm width becomes extremely long. Thus, for thin top blankets, other means of seepage control should be investigated.

51. The uplift safety factor near the landside levee toe should be such that the horizontal stresses in the levee (earth pressures and seepage forces) can be transferred into the landside foundation. This condition may require the uplift safety factor to vary from a higher value at the levee toe to a lesser value at the berm toe. No criteria can be given for this condition, but they will be dependent upon stability studies.

52. When the seepage berm is impervious, the berm width is a maximum. When the seepage berm is infinitely pervious, then the berm width is a minimum. Thus, the more seepage permitted up through the seepage berm, the shorter the berm may be. Hence, seepage berms should be made of the most pervious soils available in the interest of economy.

53. Most of the cases studied in this report have a seepage berm that is concaved upward. It may appear that such a berm could be more difficult to construct, so a berm having a uniform slope from the levee to the berm toe should be used. If both berms have common points at the levee and berm toe, then the uniform sloping berm will contain more material than the concave berm. Thus, the seepage up through the uniform sloping berm will be less than that for the concave berm. Also, the uplift under the berm and the top blanket will be greater and the safety factors will be less than those for the concave berm; hence,
a concave berm is the most effective and economical.

54. Because of the great difficulty in determining the permeability of the foundation, the semipervious top blanket, and the seepage berm, the equations presented should be used only as a guide to good judgement. In all studies, a range of permeability values should be used and not average values. In all cases, the uplift safety factor at the landside levee toe should be greater than 1.0. However, the uplift safety factor at the landside seepage berm toe may be 1.0 or greater.

55. The design of a seepage berm using the criteria of the seepage safety factor greater than 1.0 can result in berms of excessive lengths. For practical cases, it may be better to use a berm with a proper uplift safety factor at the landside levee toe and a length, $B$, such that the uplift safety factor at the landside berm toe is 1.0 or less. This could result in landside seepage boils, but the possibility of these boils endangering the levee would be minimal provided the berm length is a reasonable value. The design of the berm should consider the pipeability of the foundation and top blanket soils. Furthermore, the berm design is probably more dependent upon sound engineering judgement than upon mathematical theory.

56. A summary of the cases and the applicable permeability coefficients are given in Figure 6.

SEEPAGE BERM WITH CONSTANT SLOPE OF UPPPER SURFACE

Introduction

1. This report is Supplement No. 1 to Technical Report REMR-GT-1. The mathematical solution for the case of a landside seepage berm with a constant slope of its upper surface is presented. Examples are included in this supplement to illustrate the procedure.

Assumptions

2. The assumptions are those of the main report.

Case IX - Berm with Constant Outer Slope

General solution A

3. This is a special case of Case VIII - General Case presented in Technical Report REMR-GT-1, "Mathematical Analyses of Landside Seepage Berms," hereafter referred to as the main report. The coordinate origin is located at the landside berm toe and the horizontal distance measured landward from the downstream toe of the levee or dam \( x^* \) is positive to riverward. A typical section of the geotechnical conditions is given in Figure 1 of this supplement. The riverside and landside semipervious top blankets are transformed to effective lengths, \( \bar{x} \) and \( L_{LS} \), respectively. The top blankets of the transformed section are assumed to be impervious. The length of top blanket beneath the berm is not transformed. The landside effective length, \( L_{LS} \), is

\[
L_{LS} = \left( \frac{k_L Z_D}{k_b} \right)^{1/2} = \frac{1}{c} \tag{1}
\]

and the riverside effective length, \( \bar{x} \), is

\[
\bar{x} = \frac{\tanh (cL_1)}{c} \tag{2}
\]

* Symbols are listed and defined in the Notation (Appendix A).
Figure 1. Generalized cross section of geologic strata, leved seepage berm
where

\[ c = \left( \frac{k_f}{k_f Z_b D} \right)^{1/2} \]  \hspace{1cm} (3)

and

\[ k_f = \text{the horizontal coefficient of permeability of the pervious foundation} \]
\[ Z_b = \text{the semipervious top blanket's thickness} \]
\[ D = \text{the pervious foundation thickness} \]
\[ k_b = \text{the vertical coefficient of permeability of the semipervious top blanket} \]
\[ L_1 = \text{the distance from the riverside levee toe to the riverbank} \]

The cross section of the transformed conditions is shown in Figure 2.

4. The thickness of the seepage berm \( t_x \) at a distance \( x \) from the landside berm toe is

\[ t_x = \frac{x(t - b)}{B} + b \]  \hspace{1cm} (4)

where

\[ t = \text{the thickness of the berm at the landside levee toe (} x = B \text{)} \]
\[ b = \text{the thickness of the berm at the landside toe (} x = 0 \text{)} \]
\[ B = \text{the width of the seepage berm (the distance from the landside berm toe to the landside levee toe)} \]

5. The seepage uplift safety factor (hereafter referred to as the safety factor) will vary from \( F_0 \) at the berm toe to \( F_B \) at the landside levee toe. The variation of the safety factor will be dependent upon the geotechnical conditions and net head at the site. The safety factor \( F_0 \) for the top blanket (at \( x = 0 \)) is

\[ F_0 = \frac{Z_b \gamma'_b}{h_a \gamma_w} \]  \hspace{1cm} (5)

where

\[ \gamma'_b = \text{the buoyant unit weight of the top blanket} \]
\[ h_a = \text{the allowable seepage uplift head at the base of the top blanket, at the berm toe, measured upward from the top of the landside tailwater considered to be the upper surface of the top blanket} \]
\[ \gamma_w = \text{the unit weight of water} \]
Figure 2. Transformed cross section
Rearranging Equation 5 gives

\[ h_a = \frac{z'_b k_t}{b + Z' b K} \]          (6)

The need for a landside berm toe of thickness \( b \) results from the assumption that the horizontal permeabilities of both the berm and the top blanket are zero. As noted in paragraph 24 (pp 27-28) of the main report, the top blanket thickness \( Z_b \) may be transformed to an effective thickness \( Z'_b \) so that seepage up through the top blanket will have the same permeability as the berm \( k_t \):

\[ Z'_b = \frac{Z_b k_t}{k_b} = Z_b K \]          (7)

where the permeability ratio is

\[ \frac{k_t}{k_b} \]          (8)

The upward seepage gradient \( i \) in the berm toe is

\[ i = \frac{h_a - b}{b + Z'_b} = \frac{h_a - b}{b + Z_b K} \]          (9)

The seepage uplift safety factor \( F_o \) at the berm toe for the berm is

\[ F_o = \frac{(b + Z_b K) \gamma'_t}{(h_a - b) \gamma_w} \]          (10)

where \( \gamma'_t \) equals the buoyant unit weight of berm. Rearranging Equation 10 gives

\[ b = \frac{Z_b \left( \frac{\gamma'_b}{\gamma'_t} - K \right)}{1 + \frac{\gamma'_t}{\gamma'_w}} \]          (11)
When the ratio of unit weight \( \gamma'_b/\gamma'_t \) is equal to or less than \( \bar{K} \), then the berm toe thickness \( b \) is zero.

6. The second order differential equation relating the change in the pervious foundation seepage with the upward seepage through the top blanket and the berm is

\[
k_fD \frac{d^2h}{dx^2} = \frac{k_t(h - t_x)}{(Z_b\bar{K} + t_x)} \tag{12}
\]

where \( h \) equals the seepage uplift head (at point \( x \)) at the base of the top blanket but measured upward from the upper surface of the top blanket. Dividing both sides of Equation 12 by \( k_fD \) gives

\[
\frac{d^2h}{dx^2} = \frac{k_t(h - t_x)}{k_fD(Z_b\bar{K} + t_x)} \tag{13}
\]

Now set

\[
h - t_x = h - (t - b) \frac{x}{B} - b = y \tag{14}
\]

and differentiate \( y \) in respect to \( x \):

\[
\frac{dh}{dx} - \frac{t - b}{B} = \frac{dy}{dx} \tag{15}
\]

and again:

\[
\frac{d^2h}{dx^2} = \frac{d^2y}{dx^2} \tag{16}
\]

Also set

\[
\frac{\bar{K}}{Z_b} + \frac{t_x}{Z_b} = \frac{\bar{K}}{Z_b} + \frac{(t - b)x}{BZ_b} + \frac{b}{Z_b} = \zeta \tag{17}
\]

where \( \zeta \) equals a variable. Differentiate \( \zeta \) with respect to \( x \), which gives
Substituting Equations 14, 16, and 19 into Equation 13 produces

\[
\frac{d^2 y}{d\zeta^2} = \left(\frac{Z_b}{t - b}\right)^2 \frac{d^2 \psi}{d\zeta^2} = \psi \frac{d \psi}{d\zeta} \tag{20}
\]

where

\[
\psi = \left(\frac{Z_b}{t - b}\right)^2 \frac{d}{d\zeta} \tag{21}
\]

7. The solution of Equation 20 is

\[
y = h - t_x = 2\sqrt{\psi \zeta} \left[ C_1 I_1(2\sqrt{\psi \zeta}) + C_2 K_1(2\sqrt{\psi \zeta}) \right] \tag{22}
\]

and

\[
\frac{dy}{d\zeta} = 2\psi \left[ C_1 I_0(2\sqrt{\psi \zeta}) - C_2 K_0(2\sqrt{\psi \zeta}) \right] \tag{23}
\]

The functions \( I_0(\cdot), I_1(\cdot), K_0(\cdot), \) and \( K_1(\cdot) \) are modified Bessel functions of the first and second kinds of order zero and one, respectively. Tabulations of these functions are included in H. B. Dwight.\(^*\) The coefficients \( C_1 \) and \( C_2 \) are determined using the boundary conditions at the berm toe \((x = 0)\):

\[
h = h_a = \frac{Z_b}{\sqrt{b}}, \quad \frac{dh}{dx} = h_c = \frac{h_a}{L_{LS}}, \quad y = h_a - b
\]

---

\[
\frac{dy}{dx} = \frac{dh}{dx} - \left( \frac{t - b}{B} \right) = h_a c - \left( \frac{t - b}{B} \right), \quad \zeta_o = \bar{K} + \frac{b}{Z_b}
\]

Now
\[
\frac{dy}{dx} \frac{dx}{d\zeta} = \left( \frac{h_a c - \frac{t - b}{B}}{B} \right) \frac{Z_b B}{t - b} = \left( \frac{h_a Z_b c}{t - b} - Z_b \right)
\]

Set
\[
2\sqrt{\psi \zeta} = \omega_x \tag{25}
\]

and
\[
2\sqrt{\psi \zeta} = \omega_o \tag{26}
\]

and also
\[
2\sqrt{\psi \zeta} = \omega_B \tag{27}
\]

where
\[
\omega_x = \text{a variable}
\]
\[
\omega_B = \text{a constant}
\]
\[
\omega_o = \text{a constant}
\]

Then at the berm toe (\(x = 0\)), Equations 22 and 23 may be written as
\[
y = h_a - b = \omega_o \left[ C_1 I_1 (\omega_o) + C_2 K_1 (\omega_o) \right] \tag{28}
\]

\[
\frac{dy}{d\zeta} = Z_b \left( \frac{h_a B c}{t - b} - 1 \right) = 2\psi \left[ C_1 I_o (\omega_o) - C_2 K_o (\omega_o) \right] \tag{29}
\]

Solving the simultaneous Equations 28 and 29 and noting that
\[
I_o (x) K_1 (x) + I_1 (x) K_o (x) = \frac{1}{x} \tag{30}
\]

1-10
gives

\[ C_1 = (h_a - b) K_0(\omega_o) + \left[ (h_a - \frac{t - b}{Bc}) \sqrt{1 + \frac{b}{Z_b K}} \right] K_1(\omega_o) \] (31)

\[ C_2 = (h_a - b) I_0(\omega_o) - \left[ (h_a - \frac{t - b}{Bc}) \sqrt{1 + \frac{b}{Z_b K}} \right] I_1(\omega_o) \] (32)

8. At the landside levee toe, \( x = B \), \( h = h_t \), \( y = h_t - t \),

\[ \frac{dy}{d\zeta} = \frac{dy}{dx} \frac{dx}{d\zeta} = \frac{d(\frac{h - (-t - b)}{B})}{dx} \frac{Z_b B}{t - b} \]

and

\[ \omega_B = \frac{2Z_b BcK}{t - b} \sqrt{1 + \frac{t}{Z_b K}} \] (33)

At the landside levee toe \((x = B)\)

\[ \frac{dh}{dx} = \frac{H - h_t}{X + L_2} \] (34)

Equations 22 and 23 become \((x = B)\)

\[ h_t = t + \omega \left[ C_1 I_B(\omega_B) + C_2 K_B(\omega_B) \right] \] (35)

and

\[ \frac{dy}{d\zeta} = \left( \frac{H - h_t}{X + L_2} - \frac{t - b}{B} \right) \frac{Z_b B}{t - b} = 2\psi \left[ C_1 I_B(\omega_B) - C_2 K_B(\omega_B) \right] \] (36)

After an algebraic operation, Equation 36 becomes

\[ H = h_t + (X + L_2) \left\{ \frac{t - b}{B} \frac{2Z_b Bc^2 K}{t - b} \left[ C_1 I_B(\omega_B) - C_2 K_B(\omega_B) \right] \right\} \] (37)
The value of \( \psi \) is given by Equation 21.

9. One must assume values of the berm width \( B \) and thickness \( t \) at the landside levee toe. Using Equation 35 and 37 values of \( H \), the net head in the system is calculated. This calculated value of \( H \) will generally not agree with the design value. In addition the calculated safety factor \( F_B \) at the landside levee toe will generally not be equal to the design assumption. A systematic method is to assume a value of \( B \) and various values of \( t \). Then calculate \( H \) and \( F_B \). A curve is then drawn on a plot of \( H \) versus \( F_B \) for the selected \( B \) value and the value of \( F_B \) is found for \( H \) calculated equal to the design \( H \). A curve of \( H \) versus \( t \) is also drawn and the value of \( t \) picked off for the design head \( H \). The value of \( F_B \) will not be equal to the design value, so other values of \( B \) and \( t \) are selected and the procedure repeated. Then the values of \( F_B \) and \( t \) for the design head \( H \) are plotted against \( B \) and the values of \( B \) and \( t \) for the design value of \( H \) and \( F_B \) found. In some cases simple interpolation may be sufficient.

10. The safety factor at point \( x \), \( F_x \), is dependent upon the geotechnical and geometrical properties of the berm and foundation. The expression for the safety factor for the combined berm and top blanket is

\[
F_x (\text{combined}) = \frac{Z_b \gamma_b^I + t \gamma_t^I}{(h - t) \gamma_w^I} \quad (38)
\]

The safety factor for the berm only is

\[
F_x (\text{berm}) = \frac{(Z_b \bar{K} + t \gamma_t^I)}{(h - t_x \gamma_w^I)} \quad (39)
\]

The lower safety factor should govern. As noted on page 35 of the main report, if

\[
\bar{K} > \frac{\gamma_b^I}{\gamma_t^I}
\]

then

1-12
Equations 35 and 37 may be used to obtain the solutions for the limiting cases when $\bar{K} = 0$ and $\bar{K}$ approaches infinity. A more direct approach will be used and the basic differential equation (Equation 13) will be modified for these two limits.

Solution B, $\bar{K} = 0$

11. Equation 13 becomes

$$\frac{d^2 h}{dx^2} = 0$$

(40)

The solution is

$$h = C_3 x + C_4$$

(41)

At the berm toe, $x = 0$, $h = h_a = C_4$, and $dh/dx = h_a c = C_3$ so that

$$h = h_a (xc + 1)$$

(42)

At the landside levee toe, $x = B$, $h = h_t$ and $dh/dx = (H - h_t)/(\bar{x} + L_2)$. Using Equation 42

$$h_t = h_a (Bc + 1)$$

(43)

$$\frac{dh}{dx} = h_a c = \frac{H - h_t}{\bar{x} + L_2} = \frac{H - h_a (Bc + 1)}{\bar{x} + L_2}$$

(44)

and so

$$B = \frac{H}{h_a c} - \frac{1}{c} - \bar{x} - L_2 = \frac{HL_{LS} Y_b F}{Z_b Y_b} - (\bar{x} + L_2 + L_{LS})$$

(45)

which is also Equation 5 of the main report. No further discussion of this case will be given.
Solution C, $K$ approaches infinity

12. It is considered that the horizontal permeability of the berm is zero. Thus the berm produces a head equal to $t_x$, which is a back pressure which reduces the upward seepage through the top blanket.

Equation 13 becomes

$$\frac{d^2 h}{dx^2} = \frac{k_b (h - t_x)}{k_f D Z_b} = c^2 (h - t_x)$$

(46)

Because the berm thickness $b$ at the land toe of the berm is zero,

Equation 4 becomes

$$t_x = \frac{xt}{B}$$

(47)

Set

$$h - t_x = h - \frac{xt}{B} = y$$

(48)

so that Equation 46 becomes

$$\frac{d^2 y}{dx^2} = c^2 y$$

(49)

The solution is

$$y = h - t_x = h - \frac{xt}{B} = C_5 e^{cx} + C_6 e^{-cx}$$

(50)

At $x = 0$ (berm toe), $h = h_a$ and $dh/dx = h_a c$. Therefore,

$$h_a = C_5 + C_6$$

(51)

and

$$\frac{dh}{dx} - \frac{t}{B} = \frac{dy}{dx} = c C_5 - c C_6$$

(52)

so that

1-14
\[ h_a - \frac{t}{B_c} = C_5 - C_6 \]  

Solving for \( C_5 \) and \( C_6 \) results in

\[ C_5 = h_a - \frac{t}{2Bc} \]  

\[ C_6 = \frac{t}{2Bc} \]

Thus, Equation 50 may be written as

\[ h = \frac{x}{B} + h_a e^{cx} - \frac{t}{2Bc} e^{cx} + \frac{t}{2Bc} e^{-cx} = \frac{x}{B} + h_a e^{cx} - \frac{t}{Bc} \sinh (cx) \]  

\[ h_t = t + h_a e^{Bc} - \frac{t}{Bc} \sinh (Bc) \]

At the landside levee toe, \( x = B \) and

\[ \frac{dh}{dx} = \frac{H - h_t}{\bar{X} + L_2} = \frac{t}{B} + h_a e^{Bc} - \frac{t}{B} \cosh (Bc) \]  

and thus

\[ H = h_t + (\bar{X} + L_2) \left[ \frac{t}{B} + h_a e^{Bc} - \frac{t}{B} \cosh (Bc) \right] \]

The uplift safety factor for the combined berm and top blanket at point \( x \) is given by Equation 38. At the landside levee toe (\( x = B \))

\[ F_B = \frac{Z_b \gamma'_b + t \gamma'_t}{(h_t - t)\gamma_w} \]  

Setting \( h_t - t = 0 \), \( F_B \) approaches infinity and the maximum required value of \( t \) is

\[ t(\text{maximum}) = \frac{h_a B_c e^{Bc}}{\sinh (Bc)} \]
If \( t \) is larger than that given by Equation 61, the piezometric profile will lie partly below the upper surface of the berm and the solution developed above will not apply.

**Examples**

13. Two cases are presented below--the first for \( \bar{K} = \infty \) and the second for \( \bar{K} = 0.5 \). The same data are used as given in the main report and are repeated below:

\[
H = 30 \text{ ft}, \quad Z_b = 5 \text{ ft}, \quad D = 50 \text{ ft}
\]
\[
k_f/k_b = 200, \quad L_2 = 200 \text{ ft}
\]
\[
L_1 = 500 \text{ ft}, \quad \gamma'_b = \gamma'_t = \gamma_w, \quad F_B = F_o = 1.5, \quad F_x \neq 1.5
\]
\[
c = \frac{1}{\sqrt{200 \times 5 \times 50}} = \frac{1}{223.6} \text{ ft}
\]
\[
L_{LS} = \frac{1}{c} = 223.6 \text{ ft}
\]
\[
\bar{K} = 223.6 \text{ ft} \tanh \left( \frac{500}{223.6} \right) = 218.5 \text{ ft}
\]
\[
h_a = \frac{Z_b \gamma'_b}{F_o \gamma_w} = \frac{5 \times 62.4}{1.5 \times 62.4} = \frac{10}{3} \text{ ft}
\]

**Condition A, \( \bar{K} \) approaches infinity**

14. Use Equations 57, 59, and 60. The uplift safety factor at the landside levee toe is

\[
F_B = \frac{Z_b \gamma'_b + t \gamma'_t}{(h_t - t) \gamma_w} = \frac{5 + t}{h_t - t}
\]
\[
h_t = t + \frac{10}{3} e^{Bc} - \frac{t}{Bc} \sinh (Bc)
\]
\[
H = h_t + 418.5 \left[ \frac{10}{3} \times \frac{1}{223.6} e^{Bc} - \frac{t}{B} \cosh (Bc) \right]
\]
Use a hand-held programmable calculator. The following tabulation is for B set at 320 ft:

<table>
<thead>
<tr>
<th>t, ft</th>
<th>H, ft, cal.</th>
<th>F_B</th>
<th>h_t, ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.00</td>
<td>30.238</td>
<td>1.418</td>
<td>12.054</td>

<td>--</td>
</tr>
<tr>
<td>5.31</td>
<td>30.289</td>
<td>1.500</td>
<td>12.183</td>
</tr>
</tbody>
</table>

By linear interpolation,

\[
\frac{B - 320}{325 - 320} = \frac{30.000 - 29.865}{30.289 - 29.865}
\]

\[
B = 321.6 \text{ ft} , \text{ say 322 ft}
\]

\[
\frac{t - 5.19}{5.31 - 5.19} = \frac{321.6 - 320.0}{325.0 - 320.0}
\]

\[
t = 5.23 \text{ ft}
\]

Check for B = 321.6 ft , t = 5.23 ft , H = 30.0 ft , F_3 = 1.501 , and h_t = 12.046 ft. The variation of uplift safety factor F_x and uplift h_x , using the data derived above and using Equations 38 and 56 are as tabulated on the following page:
<table>
<thead>
<tr>
<th>x, ft</th>
<th>$F_x$(combined)</th>
<th>t, ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1.50</td>

<td>4.88</td>
</tr>
<tr>
<td>321.6</td>
<td>1.50</td>
<td>5.23</td>
</tr>
</tbody>
</table>

15. The main report presents an analytical method for determining the dimensions and uplift safety factors for a berm having an infinite vertical permeability coefficient and a horizontal permeability coefficient equal to zero. The equations are given on pages 14 to 23 of the main report for $F_o = F_x = F_B = 1.50$. The berm width is 304 ft and $t$ is 5.03 ft. The volume of the berm per station is 2347 cu yd. The volume of the berm having a constant outer slope with $B = 321.6$ ft and $t = 5.23$ ft, $b = 0$ is 3115 cu yd per station. Thus, the volume of the latter berm is 32.7 percent larger than that for the former berm.

Condition $B, K = 0.5$

16. Using Equation 11

$$b = \frac{5(1 - 0.5)}{1 + 1.5} = 1.0 \text{ ft}$$

Using Equations 31 and 32

$$C_1 = \left(\frac{10}{3} - 1\right) K_o(\omega_o) + \left[\left(\frac{10}{3} - \frac{t - 1}{B} \times 223.6\right) \times 1 + \frac{1}{5 \times 0.5}\right] K_1(\omega_o)$$

$$C_2 = \left(\frac{10}{3} - 1\right) I_o(\omega_o) - \left[\left(\frac{10}{3} - \frac{(t - 1) \times 223.6}{B}\right) \times 1 + \frac{1}{5 \times 0.5}\right] I_1(\omega_o)$$

The value of $\omega_o$ is obtained using Equations 17, 21 and 26.
\[ \omega_w = \frac{2Z_b BcK}{t - b} \sqrt{1 + \frac{b}{Z_b K}} = \frac{2 \times 5 \times B \times 0.5}{(t - 1) \sqrt{50,000}} \sqrt{1 + \frac{1}{5 \times 0.5}} = \frac{B \sqrt{3.5}}{(t - 1) \sqrt{5,000}} \]

\( \omega_w \) is found using Equation 33:

\[ \omega_B = \frac{2Z_b BcK}{t - b} \sqrt{1 + \frac{t}{Z_b K}} = \frac{B \sqrt{2.5 + t}}{(t - 1) \sqrt{5000}} \]

Equations 35 and 37 are used to calculate \( h_t \) and \( H \). With \( B \) set at 575 ft, the following results are tabulated:

<table>
<thead>
<tr>
<th>Item</th>
<th>( t = 8.0 \text{ ft} )</th>
<th>( t = 8.5 \text{ ft} )</th>
<th>( t = 9.0 \text{ ft} )</th>

<td>1.346</td>
<td>1.566</td>
</tr>
</tbody>
</table>

Find \( F_B \) and \( t \) for \( H = 30.0 \) by interpolation as follows:

\[ \frac{F_B - 1.346}{1.566 - 1.346} = \frac{30.140 - 30.000}{30.140 - 29.132} \quad \Rightarrow \quad F_B = 1.38 \]

\[ \frac{t - 8.5}{9.5 - 8.5} = \frac{30.140 - 30.000}{30.140 - 29.132} \]

\[ t = 8.57 \text{ ft} \]

At \( B = 650 \text{ ft} \), for \( H = 30.0 \) ft, the results were \( F_B = 2.067 \) and
t = 11.24 ft. At B = 590 ft for H = 30.0 ft the results were
$F_B = 1.500$ and $t = 9.13$ ft. Using Equation 39, find the uplift safety
factor for the berm only at selected values of $x$ when $B = 590$ ft and
t = 9.13 ft. To find $\omega_x$ use Equations 17 and 21 as follows:

$$\omega_x = 2\sqrt{\psi_c x} = \frac{2Z_b BcK}{t - b}\sqrt{1 + \frac{(t - b)x + b}{Z_b BK}}$$

$$= \frac{10 \times 590 \times 0.5}{(9.13 - 1)\sqrt{50,000}} \sqrt{1 + \frac{(9.13 - 1)x}{5 \times 590 \times 0.5} + \frac{1}{5 \times 0.5}}$$

$$= 1.62273 \psi 1.4 + 0.005512x$$

Use Equation 22 to find $h$ as follows:

$$h = \frac{t - b}{B} x + b + \omega_x[C_1 I_1(\omega_x) + C_2 K_1(\omega_x)]$$

$$= \frac{(9.13 - 1)}{590} x + 1 + \omega_x[C_1 I_1(\omega_x) + C_2 K_1(\omega_x)]$$

Use Equation 26 to find $\omega_o$ at $x = 0$:

$$\omega_o = \frac{2Z_b BcK}{t - b} \sqrt{1 + \frac{b}{Z_b BK}} = \frac{2 \times 5 \times 590 \times 0.5}{(9.13 - 1)\sqrt{50,000}} \sqrt{1 + \frac{1}{5 \times 0.5}} = 1.9200$$

Use Equations 31 and 32 to find $C_1$ and $C_2$ as shown below:

$$C_1 = \left(\frac{10}{3} - 1\right) K_o(1.92) + \left[\left(\frac{10}{3} - \frac{8.13\sqrt{50,000}}{590}\right) \sqrt{1 + \frac{1}{5 \times 0.5}}\right] K_1(1.92)$$

$$= \frac{7}{3} \times 0.1257 + 0.298408 \times 0.1555 = 0.3397$$

1-20
\[ c_2 = \left( \frac{10}{3} - 1 \right) \pi_0(1.92) - \left[ \left( \frac{10}{3} - \frac{8.13\sqrt{50,000}}{590} \right) \sqrt{1 + \frac{1}{5 \times 0.5}} \right] \pi_1(1.92) \]

\[ = \frac{7}{3} \times 2.157 - 0.298408 \times 1.476 = 4.5925 \]

Use Equation 39 to find the uplift safety factor for the berm only at \( x \) as follows:

\[ F_x = \left( \frac{Z_b K + t_x}{(h - t_x) \gamma_w} \right) \pi + \frac{5 \times \frac{1}{2} + t_x}{h - t_x} = \frac{2.5 + t_x}{h - t_x} \]

Using the above equation, the following values may be derived:

**Discussion**

17. A mathematical solution for the seepage up through a landside berm is presented for a berm having a constant outer slope. The equations are explicit for the determination of the uplift head at the base of the top blanket, the calculated head \( H \) on the system, and the safety factor against uplift. It is desired to determine the berm width \( B \) and the berm thickness \( t \) at the landside levee toe. The equations are implicit for \( B \) and \( t \) and the solution must be obtained by trial.

18. The required dimensions of the berm are sensitive to the permeability rates as indicated by the curve of Figure 3 for conditions 1-21
Figure 3. Volume of berm per station versus $\bar{K}$.
where $K$ is less than one. This sensitivity is rather minor when $K$ is greater than one. As shown on Figure 3, the constant slope berm requires more fill for the same uplift safety factor at the berm toe and landside levee toe than a berm having a constant safety factor. The uplift safety factors at points between the landside levee toe and the berm toe for the constant slope berm are larger than those at the berm toe and levee toe. This is a result of the extra material required for this type of berm as compared to one with a constant safety factor. Thus, the constant slope berm is more costly than the berm with a constant safety factor. The variation of the volume of fill per station of a berm having a constant outer slope as compared with a berm having a constant uplift safety factor is shown in Figure 4. The variation of the berm width and thickness at the landside levee toe is also shown in Figure 4. Two examples are given--one where $K$ is infinite and the other with $K$ equal to 0.5.

**Conclusions**

19. The following conclusions are made:

a. This analysis demonstrates that a berm having a constant outer slope requires more fill and therefore is more expensive than a berm having a constant uplift safety factor equal in value to the design value of the constant slope berm.

b. The analysis also indicates, as shown in Figure 3, that the volume of a seepage berm is very sensitive to the permeability ratio $K$ when the ratio is less than one. Thus the most pervious fill available should be used for the berm.

c. The conclusions of the main report remain unchanged.

MATHEMATICAL ANALYSES OF LANDSIDE SEEPAGE BERMS

RIVERSIDE SEEPAGE BERMS

Introduction

1. This report is Supplement No. 2 to Technical Report REMR-GT-1 (referred to as the main report). This report is concerned with riverside seepage berms. While the main report is concerned with landside berms, this report supplements the main report so that information on mathematical analyses of seepage berms may be combined under one cover, and is a condensation of a report completed under Purchase Order DACW39-75-M-4085, US Army Engineer Waterways Experiment Station, dated June 1975.

Assumptions

2. The assumptions are those of the main report.

Case X, natural riverside blanket

3. A sketch of the case is shown in Figure 1. The far riverside top blanket is assumed to be impervious. This is a result of a transformation of conditions riverside of \( x = L_1 \). If there are complex conditions, each zone is transformed and an effective length \( R_0 \) found. For each step, a new \( R_0 \) is determined and that shown in Figure 1 is the last step prior to finding \( X_1 \).

4. The head loss through the riverside top blanket \( S \) is related to seepage through the pervious foundation:

\[
\frac{k_f D}{k_b} \frac{d^2 S}{dx^2} = \frac{k_b}{Z_b} S
\]

(1)

Dividing both sides of Equation 1 by \( k_f D \) gives

\[
\frac{d^2 S}{dx^2} = \frac{k_b}{k_f D Z_b} S = c^2 S
\]

(2)
where
\[ c^2 = \frac{k_b}{k_b D Z_b} \]

The solution of Equation 2 is
\[ S = C_1 e^{cx} + C_2 e^{-cx} \tag{3} \]

At \( x = L_1 \) the boundary conditions are
\[ S = S_o = C_1 e^{cL_1} + C_2 e^{-cL_1} \tag{4} \]

Also
\[ \frac{dS}{dx} = -\frac{S_o}{R_o} = c \left( C_1 e^{cL_1} - C_2 e^{-cL_1} \right) \tag{5} \]

at \( x = 0 \), \( S = S_t \); thus,
\[ S_t = C_1 + C_2 \tag{6} \]

\[ C_1 = \frac{S_o}{2} \left( 1 - \frac{1}{cR_o} \right) e^{-cL_1} \tag{7} \]

\[ C_2 = \frac{S_o}{2} \left( 1 + \frac{1}{cR_o} \right) e^{cL_1} \tag{8} \]

and by algebraic manipulation,
\[ S = S_o \left\{ \cosh \left[ c(L - x) \right] + \frac{1}{cR_o} \sinh \left[ c(L - x) \right] \right\} \tag{9} \]

and
\[ 2-4 \]
\[
\frac{dS}{dx} = -cS_o \left\{ \sinh [c(L - x)] + \frac{1}{cR_o} \cosh [c(L - x)] \right\} \quad (10)
\]

at \( x = 0 \), \( S = S_t \), \( \frac{dS}{dx} = -S_t/x_1 \). The effective length of the entire riverside system is

\[
x_1 = \frac{-S_t}{\frac{dS}{dx}} = -S_o \left[ \frac{\cosh (cL_1) + \frac{1}{cR_o} \sinh (cL_1)}{\sinh (cL_1) + \frac{1}{cR_o} \cosh (cL_1)} \right] = \frac{1}{c} \left[ \frac{cR_o + \tanh (cL_1)}{1 + cR_o \tanh (cL_1)} \right] \quad (11a)
\]

If \( R_o = 0 \)

\[
x_1 = \frac{\tanh (cL_1)}{c} \quad (11b)
\]

If \( R_o \to \infty \)

\[
x_1 = \frac{1}{c \tanh (cL_1)} \quad (11c)
\]

If \( R_o = 1/c \)

\[
x_1 = \frac{1}{c} \quad (11d)
\]

For example:

\[
\frac{k_f}{k_b} = 200, \quad z_b = 5 \text{ ft}, \quad D = 50 \text{ ft}, \quad L_1 = 500 \text{ ft},
\]

\[
R_o = 223.6 \text{ ft}, \quad c = \frac{1}{223.6} \text{ ft}
\]

\[
X_1 = 223.6 \left( \frac{223.6 + \tanh \frac{500}{223.6}}{1 + \frac{223.6 \tanh \frac{500}{223.6}}{223.6}} \right) = 223.6 \text{ ft}
\]

Case XI, constructed
berm of uniform thickness

5. This berm is constructed over a natural blanket, as shown in Figure 2. The conditions riverside of \( L_1 \) have been reduced to an
effective length of impervious blanket of length \( R_0 \). The thickness of the natural top blanket \( Z_b \) is converted to \( Z_b' \) so that the constructed berm permeability \( k_b \) may be used for both the berm and the transformed top blanket thickness:

\[
Z_b' = Z_b \frac{k_t}{k_b} = Z_b \frac{1}{k_b} \tag{12}
\]

Equation 2 for this case is

\[
\frac{d^2 S}{dx^2} = \frac{k_t S}{k_f D(Z_b' + Z_b \overline{K})} = \frac{k_t S}{k_f D(Z_b' + \overline{K})} \frac{k_b}{Z_b} \frac{c^2 S}{Z_b Z_b' + \overline{K}} = \frac{c^2 S}{Z_b' + \overline{K}} \tag{13}
\]

where

\[
\theta^2 = \frac{c^2}{Z_b' + \overline{K}} \tag{14}
\]

The solution for Equation 13 using the results of the previous case, is

\[
S = S_0 \left\{ \cosh \left[ \theta (L_1 - x) \right] + \frac{1}{\theta R_0} \sinh \left[ \theta (L_1 - x) \right] \right\} \tag{15}
\]

\[
X_1 = \frac{1}{\theta} \left[ \frac{\theta R_0 + \tanh \theta L_1}{1 + \theta R_0 \tanh \theta L_1} \right] \tag{16a}
\]

If \( k_t = 0 \), \( \overline{K} = 0 \), \( \theta = 0 \)

\[
\frac{\tanh (\theta L_1)}{\theta} \rightarrow \theta L_1 \rightarrow L_1 \tag{16b}
\]

\[
X_1 \rightarrow R_0 + L_1 \tag{16c}
\]

If \( Z_b = 0 \), \( \theta = c \) and Equation 16a becomes Equation 11a. For example:

- \( \frac{k_f}{k_b} = 200 \), \( \frac{k_t}{k_b} = \overline{K} = \frac{1}{10} \), \( Z_b = 5 \text{ ft} \), \( D = 50 \text{ ft} \),
- \( L_1 = 500 \text{ ft} \), \( R_0 = 223.6 \text{ ft} \), \( \frac{1}{c} = 223.6 \text{ ft} \), \( Z_b = 5.5 \text{ ft} \),
\[ \theta = \frac{c}{\sqrt{\frac{223.6}{1 + \frac{Z_b}{Z_b K}}} \cdot \frac{1}{\sqrt{1 + \frac{5.5 \times 10}{5}}} = \frac{1}{774.6 \text{ ft}} } \]

\[ x_1 = 774.6 \left( \frac{774.6 + \tanh \frac{500}{774.6}}{1 + 223.6 \tanh \frac{500}{774.6}} \right) = 570.4 \text{ ft} \]

**Case XII, constructed trapezoidal berm**

6. This berm is constructed over a natural top blanket, as shown in Figure 3. The natural top blanket riverside of \( x = L_1 \) has been reduced to an effective length \( R_o \) of an impervious top blanket. The thickness \( t_x \) of the trapezoidal blanket at point \( x \) is

\[ t_x = t - [t - b] \frac{x}{L_1} \quad (17) \]

The basic second-order differential equation for this case is

\[ \frac{d^2 S}{dx^2} = \frac{k_t}{k_f D} \left( \frac{S}{(t + Z_b K)} \right) = \frac{k_t}{k_f D} \left[ \frac{S}{t - (t - b) \frac{x}{L_1} + Z_b K} \right] \frac{k_b}{k_b} \]

\[ = \frac{k_b S}{k_f D Z_b} \left[ \frac{t}{Z_b} - \frac{(t - b)x}{Z_b L_1} + \frac{1}{K} \right] \frac{k_t}{k_b} = \frac{2s}{y} \quad (18) \]

where

\[ \frac{t}{Z_b} - \frac{(t - b)x}{Z_b L_1} + \frac{1}{K} = y \quad (19) \]

\( t = \) the berm thickness at \( x = 0 \) (riverside levee toe)

\( b = \) the berm thickness at \( x = L_1 \) (riverside berm toe)

Differentiate Equation 19 to obtain

\[ 2-7 \]
\[ dx = \frac{-Z_b L_1}{t - b} \ dy \]

so that Equation 18 becomes

\[ \frac{d^2 S}{dy^2} = \left( \frac{Z_b L_1 c}{t - b} \right)^2 \frac{S}{y} = \frac{\zeta S}{y} \quad (20a) \]

where

\[ \zeta = \frac{Z_b L_1 c}{t - b} \quad (20b) \]

The solution of Equation 20a is

\[ S = \omega x \left[ C_1 I_1 (\omega x) + C_2 K_1 (\omega x) \right] \quad (21) \]

where \( I_1(\cdot) \) and \( K_1(\cdot) \) are modified Bessel functions of the first and second kind of order one and

\[ \omega_x = \frac{2Z_b L_1 cK}{t - b} \sqrt{\frac{t}{Z_b K} - \frac{(t - b)x}{Z_b L_1 K} + 1} \quad (22) \]

\[ \frac{dS}{dy} = \frac{\omega_x^2}{2y} \left[ C_1 I_0 (\omega_x) - C_2 K_0 (\omega_x) \right] \quad (23) \]

where \( I_0(\cdot) \) and \( K_0(\cdot) \) are modified Bessel functions of the first and second kind of zero order. The values of \( C_1 \) and \( C_2 \) are determined by the boundary conditions at \( x = L_1 \), where \( S = S_o \) and \( dS/dx = -S_o / R_o \):

\[ \frac{C_1}{S_o} = K_o (\omega_o) + \sqrt{\frac{1 + \frac{b}{Z_b K}}{R_o c}} K_1 (\omega_o) \quad (24) \]
The effective length $x_1$ of the entire riverside top blanket, constructed blanket, and pervious foundation is

$$x_1 = \frac{1}{c} \sqrt{1 + \frac{t}{Z_b K}} \left[ I_1(\omega_t) + \frac{C_2}{C_1} K_1(\omega_t) \right]$$

where

$$\omega_t = \frac{2Z_b L_1 c K}{t - b} \sqrt{1 + \frac{t}{Z_b K}}$$

Example:

$k_t = 10$, $k_b = 200$, $Z_b = 5$ ft, $D = 50$ ft

$b = 1$ ft, $t = 10$ ft, $L_1 = 500$ ft, $R_o = 223.6$ ft $\frac{1}{c}$

Find $x_1$ the effective length of the riverside system:
\[
\omega_o = \frac{2z_b L_cK}{t - b} \sqrt{1 + \frac{b}{z_bK}} = \frac{2 \times 5 \times 500}{(10 - 1)223.6 \times 10} \sqrt{1 + \frac{10}{5}} = 0.430344
\]

\[
\omega_t = \frac{2z_b L_cK}{t - b} \sqrt{1 + \frac{t}{z_bK}} = \frac{2 \times 5 \times 500}{(10 - 1)223.6 \times 10} \sqrt{1 + \frac{100}{5}} = 1.138585
\]

The required modified Bessel functions are:

\[
\begin{align*}
I_0(\omega_o) &= 1.0469 & I_0(\omega_t) &= 1.3514 \\
I_1(\omega_o) &= 0.2202 & I_1(\omega_t) &= 0.6666 \\
K_0(\omega_o) &= 1.0511 & K_0(\omega_t) &= 0.3466 \\
K_1(\omega_o) &= 1.9528 & K_1(\omega_t) &= 0.4790
\end{align*}
\]

\[
\frac{C_2}{C_1} = \frac{I_0(\omega_o) - \sqrt{3} I_1(\omega_o)}{K_0(\omega_o) + \sqrt{3} K_1(\omega_o)} = 0.150109
\]

\[
R_o = 1/c, \text{ therefore } R_o c = 1
\]

\[
X_1 = \frac{1}{c} \sqrt{1 + \frac{t}{z_bK}} \left[ \frac{I_1(\omega_t) + \frac{C_2}{C_1} K_1(\omega_t)}{I_0(\omega_t) + \frac{C_2}{C_1} K_0(\omega_t)} \right]
\]

\[
= 223.6 \sqrt{1 + \frac{10 \times 10}{5}} \left[ \frac{0.6666 + 0.1501 \times 0.4790}{1.3514 - 0.1501 \times 0.3466} \right] = 582.4 \text{ ft}
\]

Case XIII, constructed
berm having a constant gradient
7. A sketch for this case is shown in Figure 4. The basic second order differential equation is

2-10
\[
\frac{d^2 S}{dx^2} = \frac{k_t S}{k_f D(t_x + Z_b K)} = \frac{ik_t}{k_f D} \tag{30}
\]

where \( i \), the constant seepage gradient in the combined top blanket and berm, is

\[
i = \frac{S}{t_x + Z_b K} \tag{31}
\]

The solution of Equation 30 is

\[
S = \frac{ik_t x^2}{k_f D} + C_1 x + C_2 \tag{32}
\]

At \( x = L_1 \) the boundary conditions are

\[
S = S_o, \quad \frac{dS}{dx} = -\frac{S_o}{R_o}
\]

The values of \( C_1 \) and \( C_2 \) are based upon these conditions:

\[
C_1 = -\left(\frac{S_o}{R_o} + \frac{ik_t L_1}{k_f D}\right) \tag{33}
\]

\[
C_2 = S_o + \frac{S_o L_1}{R_o} + \frac{ik_t L_1^2}{2k_f D} \tag{34}
\]

\[
S = \frac{ik_t}{2k_f D} (L_1 - x)^2 + \frac{S_o}{R_o} (L_1 - x + R_o) \tag{35}
\]

At \( x = 0 \), the boundary conditions are:

\[
S = S_t, \quad \frac{dS}{dx} = -\frac{S_t}{X_1}
\]

so that

2-11
\[ X_1 = \frac{-S_t}{dS/dx} = - \left[ \frac{ikL^2_t}{2kD} + \frac{S_o}{R_o} (L_1 + R_o) \right] \]

At \( x = L_1 \) the gradient \( i \) through the berm and blanket is
\[ i = \frac{S_o}{b + Z_bK} \]  

Inserting Equation 37 into Equation 36 results in
\[ X_1 = \frac{L_1}{2} + \frac{b + Z_bK}{c^2Z_bL_1} \left( \frac{L_1}{R_o} + 1 \right) \]
\[ 1 + \frac{b + Z_bK}{c^2Z_bL_1KR_o} \]

If \( R_o = 0 \) then it can be shown that the effective length is
\[ X_1 = \frac{L_1}{2} \]  

As an example:

\[ \frac{k_b}{k_f} = \frac{1}{200}, \quad \frac{k_t}{k_b} = \bar{K} = \frac{1}{10}, \quad Z_b = 5 \text{ ft}, \quad D = 50 \text{ ft}, \quad L_1 = 500 \text{ ft} \]
\[ R_o \frac{1}{c} = 223.6 \text{ ft} \]

Set the cross-sectional area of the berm to \( 500[(1 + 10)/2] = 2750 \text{ ft}^2 \).
\[ t_x = \frac{c^2KZ_b}{2} (L_1 - x)^2 + (b + Z_bK) \frac{(L_1 - x)}{R_o} + b \]
\[
t = \frac{c^2 KZ_b}{2} L_1^2 + (b + \frac{Z_b K}{R_o}) \frac{L_1}{R_o} + b
\]

\[
b = \frac{2AR_o}{L_1 (L_1 + 2R_o)} - \frac{Z_b K L_1}{L_1 + 2R_o} - \frac{c^2 KZ_b L_1^2 R_o}{3(L_1 + 2R_o)}
\]

\[
t = \frac{1}{50,000} \times \frac{1}{10} \times 5 \times 500^2 + \left( b + \frac{5}{500} \right) \frac{500}{223.6} + b = 3.236b + 2.36807
\]

\[
b = 2.29 \text{ ft}, \ t = 9.79 \text{ ft}
\]

\[
x_1 = \left[ \frac{500}{2} + \frac{(2.29 + 5 \times 0.1) 50,000}{5 \times 500 \times \frac{1}{10}} \left( \frac{500}{223.6} + 1 \right) \right]
\]

\[
1 + \frac{(2.29 \times 5 \times 0.1) 50,000}{5 \times 500 \times \frac{1}{10} \times 223.6}
\]

\[
x_1 = 588.1 \text{ ft}
\]

**Case XIV, step approximation**

8. The sketch for this case is shown in Figure 5, where the constructed berm has a complex cross-section. The cross-section is approximated by steps and risers which may or may not be equal in length or in riser increments. A solution is obtained for the effective length \( x_1 \) for the first step on the far riverside using \( R_o \) and Equation 16a. The procedure is repeated for the next step using \( x_1 \) found for \( R_o \) and a new value of \( x_1 \) is obtained. This procedure is repeated until \( x_1 \) for the entire system is found.

9. As an example, use the same data given for the trapezoidal berm example. The term "M" indicates the number of steps used and \( L_1/M \) indicates the length of each individual step. When \( M \) is 1, then the approximated step is that of a berm of uniform thickness:
<table>
<thead>
<tr>
<th>M</th>
<th>L₁/M, ft</th>
<th>X₁, ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>500</td>
<td>570.426</td>

<tr>
<td>100</td>
<td>5</td>
<td>581.192</td>
</tr>
</tbody>
</table>

The decrease in the effective length $X₁$ after $M = 10$ may be the result of truncation of figures in the hand calculator used in the computation. The results for $M = 10$ are very close to that developed in the example for the trapezoidal berm where $X₁ = 582.4$ ft.

**Discussion**

10. Mathematical solutions have been presented for various types of upstream berms and natural blankets. The solution given for a natural blanket permits the calculation for the effective length of the upstream system when the thickness and permeability of the top blanket are not uniform. The solutions of the trapezoidal berm and the berm with a constant seepage gradient are presented for cases where the berms have a finite thickness $b$ at the upstream end. An approximate method is presented which is very powerful in that it permits the solution for berms having a complex cross section. It may be used for the trapezoidal and constant gradient berms if desired. In the examples given the berm width $L₁$ and cross-sectional areas are equal. The effective lengths $X₁$ are:

- Berm, uniform thickness: 570.4 ft
- Berm, trapezoid: 582.4 ft
- Berm, constant gradient: 588.1 ft

Thus, a berm designed for a constant gradient is the most effective, but not excessively so.

11. No attempt has been made to find the optimum berm length for a given cross section. Limited studies made by the author indicated
that optimal lengths occur when the upstream berm toe thickness $b$ is zero.

12. It was also found that the effective length $X_1$ is not very sensitive to variation in berm length. For practical cases the determination of the optimum berm length should include costs of clearing and foundation preparation of the berm area. Further it may not be desirable to build a berm with the thickness too small just to obtain an optimal berm width because of possible damage to the berm from erosion by runoff and riverflows.

**Conclusion**

13. In conclusion, it should be noted that the riverside berm should be constructed with the least pervious soils that are economically available, while landside berms should be constructed with the most pervious soils.

Supplement No. 3

SOLUTIONS FOR GENERAL CASES AND SHORT BERMS
SOLUTIONS FOR GENERAL CASES AND SHORT BERMS

Introduction

1. This supplement is a continuation of the work presented in Technical Report REMR-GT-1 (referred to as the main report) and extended in Supplement No. 1. In addition, analyses for short berms are also presented. The allowable uplift load \( h_a \) at the base of the top blanket just under the berm toe is

\[
h_a = \frac{Z_b \gamma_b'}{F\gamma_w}
\]

where
- \( Z_b \) = the top semipervious blanket thickness
- \( \gamma_b' \) = the buoyant unit weight of the top blanket
- \( F \) = the uplift safety factor
- \( \gamma_w \) = the unit weight of water

To generalize the solution, the uplift safety factor will be \( F_{LS} \) which is applied only to the top blanket at the berm toe and which may be different from the safety factor at the berm toe for the berm only or that for the combined berm and top blanket. Equation 1 becomes

\[
h_a = \frac{Z_b \gamma_b'}{F_{LS}\gamma_w}
\]

The origin of the coordinate systems for solutions presented in this report will be at the landside levee toe and will be positive in the levee landward direction.

Assumptions

2. The assumptions of the main report and Supplements No. 1 and No. 2 apply to this report. In some instances it may be desirable to
design berm widths (landward dimension) that are less than those given in the main report and Supplement No. 1. For these cases the computed uplift safety factors for the top blanket at the berm toe \((x = B)\) will be less than unity. This indicates the need for additional assumptions which are:

a. The minimum uplift safety factor \(F_{LS}\) at the berm toe for the top blanket is unity.

b. A crack develops in the top blanket at and parallel to the berm toe.

3. These assumptions are justified as follows. As the uplift head \(h_a\) increases, a condition will develop where the transmissibility of the foundation is insufficient to conduct away the foundation seepage. The excess seepage will collect under the top blanket to form a seepage blister. The uplift safety factor for the top blanket will remain at unity. If the distortion of the top blanket becomes excessive, it will fail by cracking at the berm toe in a direction parallel to the berm toe. Seepage will emerge through the crack and the uplift safety factor of the top blanket will remain at unity. The seepage up through the crack may tend to form "boils" and possibly "pipes," but the duration of the flood may be such as not to permit the development of dangerous conditions. In some cases it may be desirable to install a trench drain along the berm toe. In some instances the top blanket will not be uniform and local boils may develop. The uplift safety factor for the top blanket will not be uniform but will be greater than unity. The value of \(F_{LS}\) at the berm toe for the top blanket is assumed to be equal to 1.0 for all short berms.

4. The foundation seepage flux per unit levee length at the berm toe is for \(x = B - dx:\)

\[
\frac{Q_B}{k_f D} = - \frac{dh}{dx} \tag{3}
\]

where \(Q_B\) equals seepage per unit length of levee in the pervious foundation at berm toe \((x = B)\). At \(x = B + dx\) the flux per unit length is
\[
\frac{Q_{LS}}{k_f D} = h_c = \frac{h_a}{L_{LS}}
\]  

(4)

where

\( k_f \) = the horizontal permeability of the pervious foundation
\( D \) = the thickness of the pervious foundation
\( c = \sqrt{\frac{k_b}{k_f D}} = \frac{1}{L_{LS}} \)

\( k_b \) = the vertical permeability of the top blanket
\( Z_b \) = the thickness of the top blanket
\( L_{LS} \) = the effective length of the landside top blanket

If the seepage flux up through the crack in the top blanket at the berm toe is zero, then

\[
\frac{Q_B}{k_f D} = \frac{Q_{LS}}{k_f D} = -\frac{dh}{dx} = h_c
\]

(5)

If the seepage flux up through the crack is not zero, then its value per unit length of berm is

\[
\frac{Q_{BT}}{k_f D} = -\frac{dh}{dx} - h_c
\]

(6)

Case I, Impervious Berms

5. The basic second-order differential equation is

\[
\frac{d^2 h}{dx^2} = 0
\]

(7)

The solution of Equation 7 is

\[
h_x = C_1 x + C_2
\]

(8)

where \( h_x \) is the uplift head at the base of the top blanket at point \( x \) but measured upward from the top of the top blanket and \( C_1 \) and \( C_2 \) are constants. At \( x = B \), \( h_x = h_a \) and so
\[ h_a = C_1 B + C_2 \]  

Also at \( x = B \)

\[- \frac{dh}{dx} = C_1 = - \frac{H - h_a}{\bar{X} + L_2 + B} \]

where

\[ H \] = the net head on the systems
\[ \bar{X} \] = the effective length of the riverside top blanket
\[ L_2 \] = the base width of the levee
\[ B \] = the berm width (landside levee toe to berm toe)

and so

\[ C_2 = h_a + \frac{(H - h_a)B}{\bar{X} + L_2 + B} \]  

Thus Equation 8 may be expressed as

\[ h_x = \frac{(H - h_a)(B - x)}{\bar{X} + L_2 + B} + h_a \]

The uplift head at the landside levee toe \( h_t \) \( (x = 0) \) is

\[ h_t = \frac{(H - h_a)B}{\bar{X} + L_2 + B} + h_a \]

Since the berm is impervious, there is no upward seepage in the berm and the underlying top blanket. Upward seepage occurs in the top blanket beyond the berm toe. The uplift safety factor for the berm only is

\[ F = \frac{t_x \gamma'_t}{\gamma_w (h_x - t_x)} \]

where

\[ t_x \] = the berm thickness at point \( x \)
\[ \gamma'_t \] = the buoyant unit weight of the berm

Equation 14 may be rewritten as

3-6
\[ t_x = \frac{h_x}{\frac{\gamma_t}{\gamma_w} + 1} \quad (15) \]

6. If the berm is short, there will be seepage \( Q_{BT} \) up through the crack in the top blanket at the berm toe. From Equation 6

\[ \frac{Q_{BT}}{k_f D} = \frac{H - h_a}{\frac{X}{X + L_2} + B} - h_a c \quad (16) \]

If \( Q_{BT} \) is zero, then

\[ H - h_a = h_a c \left( \frac{X}{X + L_2} + B \right) \quad (17) \]

and the berm width \( B \) is

\[ B = \frac{H - h_a}{h_a c} - \left( \frac{X}{X + L_2} \right) \quad (18) \]

7. The following is presented as an example:

- \( H = 30 \) ft,
- \( Z_b = 5 \) ft,
- \( D = 50 \) ft,
- \( \frac{k_f}{k_b} = 200 \),
- \( c = \frac{1}{223.6} \) ft,
- \( L_{LS} = 223.6 \) ft,
- \( X = L_2 = 418.5 \) ft

\[ F_{LS} = \frac{F}{B \text{, ft}} \]

</table>

\( b = \text{the berm thickness (berm toe)} \); \( x = B \).
Case II, Infinitely Pervious Berm

8. The permeability of the berm, both in the vertical and horizontal directions, is infinite. The berm offers no resistance to seepage flowing up through the top blanket. The berm acts only as a weighted filter to provide acceptable uplift safety factors. The basic second-order differential equation is

\[
\frac{d^2 h}{dx^2} = \frac{k_{bh} x}{k_f DZ_b} = c^2 h
\]

(19)

The solution is

\[
h_x = C_1 e^{xc} + C_2 e^{-xc}
\]

(20)

At \( x = 0 \), \( h_x = h_t \) so that

\[
h_t = C_1 + C_2
\]

(21)

At \( x = B \), \( h_x = h_a \)

\[
h_a = C_1 e^{Bc} + C_2 e^{-Bc}
\]

(22)

The values of \( C_1 \) and \( C_2 \) are obtained by solving the set of simultaneous Equations 21 and 22:

\[
C_1 = \frac{h_a - h_t e^{-Bc}}{2 \sinh (Bc)}
\]

(23)

and

\[
C_2 = \frac{h_t e^{Bc} - h_a}{2 \sinh (Bc)}
\]

(24)

Equation 20 may be expressed as

\[
h_x = \frac{h_a \sinh (xc) + h_t \sinh [(B - x)c]}{\sinh (Bc)}
\]

(25)
The seepage gradient in the pervious foundation is

\[ - \frac{dh}{dx} = \frac{c}{\sinh (Bc)} \left[ h_t \cosh (B - x)c - h_a \cosh (xc) \right] \tag{26} \]

At \( x = 0 \)

\[ \left( \frac{H - h_t}{X + L_2} \right) = - \frac{dh}{dx} = \frac{c}{\sinh (Bc)} \left[ h_t \cosh (Bc) - h_a \right] \tag{27} \]

which after algebraic manipulation becomes

\[ h_t = \frac{H + h_a c \sinh (Bc)}{c(X + L_2)} \left( 1 + \frac{c(X + L_2)}{\tanh (Bc)} \right) \tag{28} \]

At the berm toe \( (x = B) \) the seepage flux per unit levee length is

\[ \frac{Q_{BT}}{k_f D} = \frac{Q_B}{k_f D} - \frac{Q_{LS}}{k_f D} \tag{29} \]

\[ \frac{Q_{BT}}{k_f D} = \frac{c}{\sinh (Bc)} \left( h_t - h_a \cosh Bc \right) - h_a c \tag{30} \]

If \( Q_{BT} = 0 \), then

\[ h_t = h_a \left[ \sinh (Bc) + \cosh (Bc) \right] \tag{31} \]

If Equations 28 and 31 are equated, one can obtain an expression for the berm width \( B \):

\[ B = \frac{1}{c} \ln \left\{ \frac{H}{h_a \left[ 1 + c(X + L_2) \right]} \right\} \tag{32} \]

9. The following example is presented:

\[ H = 30 \text{ ft}, \quad z_b = 5 \text{ ft}, \quad D = 50 \text{ ft}, \quad \frac{k_f}{k_b} = 200 \]
\[ \bar{X} + L_2 = 418.5 \text{ ft}, \quad c = \frac{1}{223.6} \text{ ft}, \quad \gamma_w = \gamma_b' , \]

\[ B = 223.6 \ln \left[ \frac{30}{F_{LS} \left( 1 + \frac{418.5}{223.6} \right)} \right] \]

<table>
<thead>
<tr>
<th>( F_{LS} )</th>
<th>( B, \text{ ft} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0</td>
<td>164.8</td>
</tr>
<tr>
<td>1.3</td>
<td>223.4</td>
</tr>
<tr>
<td>1.5</td>
<td>255.4</td>
</tr>
</tbody>
</table>

If \( B \) is greater than 165 ft; \( Q_{BT} \) is zero. If \( B \) is less than 165 ft, \( Q_{BT} \) is finite and the berm is short with \( F_{LS} = 1.0 \).

10. Another example is presented below with the data the same as above, plus

\[ \gamma_w = \gamma_b' = \frac{\gamma_t'}{2} \quad (\gamma_t' \text{ is the moist weight of the berm}) \]

\[ B = 120 \text{ ft}, \quad F = 1.5, \quad F_{LS} = 1.0 \]

\[ h_t = \frac{30 + \frac{5 \times 418.5}{223.6 \sinh \left( \frac{120}{223.6} \right)}}{1 + \frac{418.5}{223.6} \times \frac{1}{\tanh \left( \frac{120}{223.6} \right)}} = 9.68 \text{ ft} \]

\[ \frac{Q_{BT}}{k_f D} = \frac{1}{223.6 \sinh \left( \frac{120}{223.6} \right)} \left[ 9.68 - 5 \cosh \left( \frac{120}{223.6} \right) \right] - \frac{1}{\sqrt{2000}} \]

\[ = 0.00898 \]

The berm thickness \( t_x \) is (from Equation 14 of the main text)

\[ t_x = \left[ \frac{h_x 1.5 - 5}{2} \right] = 0.75 h_x - 2.5 \]

\[ h_x = \frac{5 \sinh \left( \frac{x}{223.6} \right) + 9.68 \sinh \left( \frac{120 - x}{223.6} \right)}{\sinh \left( \frac{120}{223.6} \right)} \]

3-10
11. The horizontal permeability of the berm is zero, while that for the vertical is infinite. Thus the berm permits water to be stored in it which produces a back hydraulic head on the seepage flowing up through the top blanket. The basic second-order differential equation is (See Equation 19 of the main report):

\[
\frac{d^2h}{dx^2} = c^2(h_x - t_x) = h_x \theta + \xi
\]

(33a)

where

\[
\xi = \frac{c^2 z_b' y_b'}{\gamma_w' + \gamma_t'}
\]

(33b)

Setting

\[
y = h_x \theta + \xi
\]

(34)

permits expressing Equation 33a as

\[
\frac{d^2y}{dx^2} = \theta y
\]

(35)

where

\[
\theta = \frac{c^2}{\gamma_w' + \gamma_t'}
\]

(36)

The solution of Equation 35 is

\[
y = C_1 e^{x\sqrt{\theta}} + C_2 e^{-x\sqrt{\theta}} = \theta h_x + \xi
\]

(37)
and so

\[ h_x = \frac{C_1}{\theta} e^{x\sqrt{\theta}} + \frac{C_2 e^{-x\sqrt{\theta}}}{\theta} - \frac{e^{B\sqrt{\theta}}}{\theta} \]  

(38)

where

\[ \frac{e^{B\sqrt{\theta}}}{\theta} = \frac{Z_b \gamma'_b}{\gamma'_t} \]  

(39)

At \( x = B \), \( h_x = h_a \)

\[ h_a = \frac{C_1}{\theta} e^{B\sqrt{\theta}} + \frac{C_2 e^{-B\sqrt{\theta}}}{\theta} - \frac{e^{B\sqrt{\theta}}}{\theta} \]  

(40)

At \( x = 0 \), \( h_x = h_t \)

\[ h_t = \frac{C_1}{\theta} + \frac{C_2}{\theta} - \frac{e^{B\sqrt{\theta}}}{\theta} \]  

(41)

Solving the set of simultaneous Equations 40 and 41, one obtains

\[ \frac{C_1}{\theta} = \frac{\left( h_a - h_t e^{-B\sqrt{\theta}} \right) + \frac{e^{B\sqrt{\theta}}}{\theta} \left( 1 - e^{-B\sqrt{\theta}} \right)}{2 \sinh (B\sqrt{\theta})} \]  

(42)

and

\[ \frac{C_2}{\theta} = \frac{\left( h_t e^{B\sqrt{\theta}} - h_a \right) - \frac{e^{B\sqrt{\theta}}}{\theta} \left( 1 - e^{B\sqrt{\theta}} \right)}{2 \sinh (B\sqrt{\theta})} \]  

(43)

so that Equation 38 can be written as

\[ h_x = \left( h_a + \frac{Z_b \gamma'_b}{\gamma'_t} \right) \sinh (x\sqrt{\theta}) + \left( h_t + \frac{Z_b \gamma'_b}{\gamma'_t} \right) \frac{\sinh \left[ (B - x)\sqrt{\theta} \right]}{\sinh (B\sqrt{\theta})} - \frac{Z_b \gamma'_b}{\gamma'_t} \]  

(44)

The seepage gradient in the pervious foundation is

\[ -\frac{dh}{dx} = \left( h_t + \frac{Z_b \gamma'_b}{\gamma'_t} \right) \frac{\sqrt{\theta} \cosh \left[ (B - x)\sqrt{\theta} \right]}{\sinh (B\sqrt{\theta})} - \left( h_a + \frac{Z_b \gamma'_b}{\gamma'_t} \right) \frac{\sqrt{\theta} \cosh (x\sqrt{\theta})}{\sinh (B\sqrt{\theta})} \]  

(45)
At $x = 0$

$$\frac{dh}{dx} = \frac{h - h_t}{X + L_2} = \left( h_t + \frac{Z_b y'_b}{\gamma'_t} \right) \frac{\sqrt{\theta} \cosh (B\sqrt{\theta})}{\sinh (B\sqrt{\theta})}$$

$$- \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \frac{\sqrt{\theta}}{\sinh (B\sqrt{\theta})}$$

from which one obtains

$$h_t = \frac{H + \frac{(X + L_2)\sqrt{\theta}}{\sinh (B\sqrt{\theta})} \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) - \frac{(X + L_2)\sqrt{\theta}}{\sinh (B\sqrt{\theta})} \frac{Z_b y'_b}{\gamma'_t} \cosh (B\sqrt{\theta})}{1 + \frac{(X + L_2)\sqrt{\theta}}{\tanh (B\sqrt{\theta})}}$$

The seepage flux up through the berm toe crack is

$$\frac{Q_{BT}}{k_D} = \left( h_t + \frac{Z_b y'_b}{\gamma'_t} \right) \frac{\sqrt{\theta}}{\sinh (B\sqrt{\theta})} - \left( h_a + \frac{Z_b y'_b}{\gamma'_t} \right) \frac{\sqrt{\theta}}{\tanh (B\sqrt{\theta})} - h_a c$$

If $Q_{BT}$ is zero, then

$$h_t = h_a \left[ \frac{c}{\sqrt{\theta}} \sinh (B\sqrt{\theta}) + \cosh (B\sqrt{\theta}) \right] - \frac{Z_b y'_b}{\gamma'_t} \left[ \cosh (B\sqrt{\theta}) - 1 \right]$$

Equating Equations 47 and 49 permits the determination of the berm width $B$ for the condition of no flow up through the berm toe crack. For short berms, $B$ will be less than that calculated above. The equating of Equations 47 and 49 results in an implicit expression and the value of $B$ must be found by trial. This can readily be done using a programmable hand calculator.

12. The uplift safety factor for the combined berm and top blanket is

3-13
The berm thickness $t_x$ at point $x$ is

$$t_x = \frac{h_x - Z_b \gamma_b'}{\gamma_t \gamma_w c} \left(1 + \frac{\gamma_t'}{\gamma_w c}ight)$$  \hspace{1cm} (51)

13. An example is worked out as follows:

$H = 30$ ft, $Z_b = 5$ ft, $D = 50$ ft, $k_F = 200$, $k_c = 200$,

$$\frac{X}{L} + L_2 = 418.5 \text{ ft, } \frac{1}{c} = 223.6 \text{ ft},$$

$$\gamma_w = \gamma_b' = \gamma_t' = 62.4 \text{ lb/cu ft}$$

For $Q_{BT} = 0$

<table>
<thead>
<tr>
<th>$F_c$</th>

<tr>
<td>1.5</td>
<td>207</td>
<td>--</td>
<td>304</td>
</tr>
</tbody>
</table>

(See tabulation, page 22, main report)

14. The following example is for a short berm with $Q_{BT} \neq 0$ and the same data as above except that $F_{LS} = 1.0$, $F_c = 1.5$, and $B = 150$ ft:

$$B\sqrt{\theta} = 0.4242769669$$

$$\sinh (B\sqrt{\theta}) = 0.4371211108$$

$$\cosh (B\sqrt{\theta}) = 1.091363764$$

$$h_t = \frac{418.5 \times 10}{223.6\sqrt{2.5 \sinh (B\sqrt{\theta})}} - \frac{418.5 \times 5 \times \cosh (B\sqrt{\theta})}{223.6\sqrt{2.5 \sinh (B\sqrt{\theta})}}$$

$$h_t = \frac{418.5 \cosh (B\sqrt{\theta})}{223.6\sqrt{2.5 \sinh (B\sqrt{\theta})}}$$

$$= 10.550 \text{ ft}$$

Case IV, Permeability of Seepage Berm Equal to That of the Top Semipervious Blanket

15. This is a limiting condition for Case V and will not be discussed.

Case V, Semipervious Berm

16. The permeability ratio of the berm to the top semipervious blanket $K$ ranges between zero and unity. The basic second-order differential equation is

$$\frac{d^2h}{dx^2} = \frac{k}{k_f} \frac{h'}{h} = \frac{k}{k_b} \frac{2h'}{b} = \frac{\bar{k}}{\bar{k}_b} \frac{2h'}{b} = \theta$$

(52)

The solution is

$$h_x = \frac{\theta x^2}{2} + C_1 x + C_2$$

(53)

At $x = 0$, $h_x = h_t = C_2$, and at $x = B$, $h_x = h_a$, so that

$$h_a = \frac{\theta B^2}{2} + C_1 B + h_t$$

(54)

$$C_1 = - \frac{h_t - h_a}{B} - \frac{\theta B}{2}$$

(55)

Equation 53 may be expressed as

$$h_x = \frac{\theta x^2}{2} - (h_t - h_a) \frac{x}{B} - \frac{\theta B x}{2} + h_t$$

(56)

The seepage gradient in the pervious foundation is

3-15
\[- \frac{dh}{dx} = -\theta x + \frac{h_t - h_a}{B} - \frac{\theta B}{2} \]  \hspace{1cm} (57)

At \( x = 0 \)

\[- \frac{dh}{dx} = \frac{H - h_t}{\bar{X} + L_2} = \frac{h_t - h_a}{B} + \frac{\theta B}{2} \]  \hspace{1cm} (58)

so that

\[ h_t = -\theta \frac{\bar{X} + L_2}{B} - \frac{\theta B (\bar{X} + L_2)}{2} \]  \hspace{1cm} (59)

The seepage flux up through the berm toe crack is

\[ \frac{Q_{BT}}{k_f D} = -\theta B + \frac{h_t - h_a}{B} + \frac{\theta B h_a}{2} - h_a c \]  \hspace{1cm} (60)

If \( Q_{BT} \) is zero, then

\[ h_t = \frac{\theta B^2}{2} + h_a (1 + Bc) \]  \hspace{1cm} (61)

Equations 59 and 61 are equated so that

\[ B = a \left( -1 + \sqrt{1 + \frac{\Delta}{a^2}} \right) \]  \hspace{1cm} (62)

where

\[ \alpha = (\bar{X} + L_2) + \frac{h_a c}{\theta} \]  \hspace{1cm} (63)
and

\[ \Delta = \frac{2}{g} \left\{ H - h_a \left[ 1 + c(\bar{X} + L_2) \right] \right\} \]  \hspace{1cm} (64)

The expression for the berm thickness \( t_x \), using Equation 84 of the main report, is

\[
t_x = \frac{h_x - \frac{Z_b \gamma'_b K}{\gamma'_w F}}{1 + \frac{\gamma'_t}{\gamma'_w F}} \]  \hspace{1cm} (65)

17. An example of this is computed as follows:

- \( H = 30 \text{ ft} \), \( Z_b = 5 \text{ ft} \), \( D = 50 \text{ ft} \), \( \bar{X} + L_2 = 413.5 \text{ ft} \),
- \( \frac{1}{c} = 223.6 \text{ ft} \), \( \gamma_w = \gamma'_b = \gamma'_t = 62.4 \text{ lb/cu ft} \), \( Q_{3T} = 0 \),
- \( \frac{k_f}{k_b} = 200 \)

(See table, page 31, of the main report)

The values of \( B \) are sensitive to variations of \( \bar{K} \) and \( F_{LS} \).

18. An example of a short berm follows. The same data as above is used, plus

- \( F = 1.5 \), \( F_{LS} = 1.0 \), \( B = 300 \text{ ft} \), \( \bar{K} = 0.1 \)
The seepage flux up through the top blanket crack at the berm toe, per unit berm length, is

\[
\frac{Q_{BT}}{k_{f,D}} = \frac{0.1 \times 5 \times 300}{50,000 \times 1.5 \times 2} + \frac{15.089 - 5}{300} - \frac{5}{223.6} = 0.01027
\]

\[Q_{BT} = \frac{0.1 \times 5 \times 300}{50,000 \times 1.5 \times 2} \left( x^2 - 300x \right) - \left( \frac{15.089 - 5}{300} \right) x + 15.089
\]

\[h_t = \frac{30 + \frac{5 \times 418.5}{300} - \frac{0.1 \times 5 \times 300 \times 418.5}{1.5 \times 50,000}}{1 + \frac{418.5}{300}} = 15.089 \text{ ft}
\]

\[h_x = \frac{0.1 \times 5}{50,000 \times 1.5 \times 2} \left( x^2 - 300x \right) - \left( \frac{15.089 - 5}{300} \right) x + 15.089
\]

\[t_x = \frac{h_x}{\frac{1.5}{1 + \frac{1}{1.5}}} = 0.6h_x - 0.2
\]

</table>

The seepage flux up through the top blanket crack at the berm toe, per unit berm length, is

19. The uplift factor for the berm only varies in a linear manner from a minimum of \( F_B \) at the berm toe \((x = B)\) to a maximum of \( F_0 \) at the levee landside toe \((x = 0)\). The uplift safety factor for the top blanket at the berm toe is \( F_{LS} \). The permeability ratio \( \bar{K} \) varies from zero to unity. The case for \( \bar{K} \) greater than unity will be discussed under Case VII. The basic second-order differential equation is Equation 87 of the main report. If \( F_B \neq F_{LS} \) then Equation 105 of the main report must be modified as follows:
\[
B^2 \left[ \frac{F_o}{(F_o - F_b)^2} \ln \left( \frac{F_o}{F_B} \right) - \frac{1}{F_o - F_b} \right] + B \left[ \frac{\bar{X} + L_2}{F_o - F_b} \ln \left( \frac{F_o}{F_B} \right) + \frac{\gamma'_b}{F_{LS} K \gamma'_t} \right] \\
+ \left[ \frac{\gamma'_b(\bar{X} + L_2 + L_{LS})}{\gamma'_t \frac{F_{LS} K_c}{F_L K c}} - \frac{H_y}{Z_b K \gamma'_t c^2} \right] = 0
\]

Set

\[
\overline{A} = \left[ \frac{F_o}{(F_o - F_b)^2} \ln \left( \frac{F_o}{F_B} \right) - \frac{1}{F_o - F_b} \right] \tag{67}
\]

\[
\overline{C} = \left[ \frac{\bar{X} + L_2}{F_o - F_b} \ln \left( \frac{F_o}{F_B} \right) + \frac{\gamma'_b}{F_{LS} K \gamma'_t} \right] \tag{68}
\]

\[
\overline{D} = \left[ \frac{\gamma'_b(\bar{X} + L_2 + L_{LS})}{\gamma'_t \frac{F_{LS} K_c}{F_L K c}} - \frac{H_y}{Z_b K \gamma'_t c^2} \right] \tag{69}
\]

The berm width \( B \), for \( Q_{BT} = 0 \), is

\[
B = \frac{\overline{C}}{2\overline{A}} \left( -1 + \sqrt{1 - \frac{4\overline{AD}}{\overline{C}^2}} \right) \tag{70}
\]

The uplift head \( h_x \) and the berm thickness \( t_x \) are given by Equations 99 and 110 of the main report.

20. An example is presented as follows:

\( H = 30 \text{ ft}, \ Z_b = 5 \text{ ft}, \ D = 50 \text{ ft}, \ \bar{X} + L_2 = 418.5 \text{ ft}, \)

\( \frac{1}{c} = L_{LS} = 223.6 \text{ ft}, \ \gamma_w = \gamma'_b = \gamma'_t = 62.4 \text{ lb/cu ft} \)

\( \frac{k_f}{k_b} = 200, \ F_o = 1.5, \ K = 0.1 \)

</tbody>
</table>

The above results should be compared with those tabulated for Case V for $\bar{K} = 0.1$. If $F_o$, $F_{LS}$, and $\bar{K}$ are fixed, $B$ varies only slightly as $F_B$ varies. If $F_B = F_{LS}$, $B$ varies in a significant manner as $F_B$ varies.

21. For a short berm, $B$ is less than that given by Equation 70.

The uplift head at the base of the top blanket is

$$h_x = \theta (\phi \ln \phi - \phi) + C_1 \phi + C_2$$  \hspace{1cm} (71)

where

$$\theta = \frac{-\bar{K}B^2Z_b c^2 \gamma'}{\gamma_w (F_o - F_B)^2}$$  \hspace{1cm} (72)

and

$$\phi = F_o - (F_o - F_B) \frac{x}{B}$$  \hspace{1cm} (73)

At $x = B$, $h_x = h_a$, $\phi = F_B$

$$h_a = \theta (F_B \ln F_B - F_a) + C_1 F_B + C_2$$  \hspace{1cm} (74)

3-20
At \( x = 0 \), \( h_x = h_t \), \( \phi = F_o \)

\[
h_t = \theta (F_o \ln F_o - F_B) + C_1 F_o + C_2 \tag{75}
\]

Subtracting Equation 75 from Equation 73, and then with minor algebraic manipulation one has

\[
C_1 = \frac{h_t - h_a}{F_o - F_B} - \frac{\theta}{F_o - F_B} \left[ F_o \ln F_o - F_B \ln F_B - (F_c - F_B) \right] \tag{76}
\]

and from Equation 74

\[
C_2 = h_a - \theta (F_B \ln F_B - F_B) - C_1 F_B \tag{77}
\]

From Equation 110 of the main report, the berm thickness at point \( x \) is

\[
t_x = \frac{h_x - \frac{\gamma'Z_{bK}}{\gamma_t b}}{\left(1 + \frac{\gamma'Z_{bK}}{\gamma_t b} \right) \frac{F_o - (F_o - F_B) x}{F_B}} \tag{78}
\]

The value of \( h_t \) at \( x = 0 \) is

\[
h_t = \frac{h_a - \left(\frac{\gamma'Z_{bK}}{\gamma_t b} \right) (F_o - F_B) \ln F_o - (\bar{X} + \bar{L}_2) \frac{\theta}{B} (F_o \ln F_o - F_B \ln F_B - F_o + F_B) + \frac{(\bar{X} + \bar{L}_2)}{B} h_a}{1 + \left(\frac{\gamma'Z_{bK}}{\gamma_t b} \right) (F_o - F_B)} \tag{79}
\]

The seepage flux per unit levee length up through the top blanket crack at the berm toe is

\[
Q_{BT} = \frac{F_o - F_B}{k_tD} \left( \theta \ln F_B + C_1 \right) - h_a c \tag{80}
\]

22. An example is presented as follows:
\[ H = 30 \text{ ft}, \ Z_b = 5 \text{ ft}, \ D = 50 \text{ ft}, \ \frac{k_r}{k_b} = 200, \ \bar{K} = 0.1, \]
\[ \bar{X} + L_2 = 418.5 \text{ ft}, \ \frac{1}{c} = I_{LS} = 223.6 \text{ ft}, \]
\[ Y_w = Y_b' = \gamma_t = 62.4 \text{ lb/cu ft}, \ B = 500 \text{ ft}, \ h_a = 5 \text{ ft}, \]
\[ F_o = 1.5, \ F_B = 1.1, \ F_{LS} = 1.0 \]
\[ \theta = \frac{0.1 \times 500^2 \times 5 \times 62.4}{62.4(1.5 - 1.1)} = 15.625 \]

\[ h_t = \left[ 30 - (418.5)(1.5 - 1.1) \frac{15.625}{500} \ln 1.5 + (418.5) \frac{15.625}{500} (1.5 \ln 1.5 - 1.1 \ln 1.1 - 1.5 + 1.1) - \frac{418.5 \times 5}{500} \right] \]

* 13.633979*

\[ C_1 = \left[ \frac{(13.633979 - 5)}{(1.5 - 1.1)} - \frac{15.625}{(1.5 - 1.1)} (1.5 \ln 1.5 - 1.1 \ln 1.1 - 1.5 + 1.1) \right] = 17.54758561* \]

\[ C_2 = 5 - 15.625(1.1 \ln 1.1 - 1.1) = 17.54758561 \times 1.1 \]

\[ = 1.247012114* \]

\[ \phi = 1.5 - (1.5 - 1.1) \frac{x}{500} = 1.5 - 0.0008x \]

\[ h_x = 15.625(\phi \ln \phi - \phi) + 17.54758561\phi + 1.247012114 \]

\[ t_x = \frac{h_x - 0.5}{1.5 - 0.0008x} = \frac{h_x - \frac{0.5}{x}}{1.5 - 0.0008x} \]

with the following results tabulated:

**Case VII, Pervious Berm**

23. The basic second-order differential equation has not been solved and therefore it is necessary to use a finite difference method of solution for the uplift head \( h_x \). The method is shown on page 46 of the main report. An expression for the initial value of \( h_{2i} \) is given on the lower middle part of page 47 of the main report, which contains \( h_a \). The definition of \( h_a \) is not general and the following modification is necessary:

\[
\begin{align*}
\frac{h_{2i}}{\gamma_b'} &= \frac{Z_b\gamma_b'}{Y_{wF_{LS}}} \left[ \frac{\Delta x}{L_{LS}} + 1 - \frac{c^2\Delta x^2(\gamma_t' + \gamma_w F_{LS})}{2(F_{LS}' + \gamma_w F_{K} + \gamma_t' K - \gamma_b')} \right] \\
&= \left( \frac{\Delta x}{X + L_2} + 1 \right) - \frac{H\Delta x}{X + L_2} + \frac{c^2\Delta x^2 \left( h_t + \frac{Z_b\gamma_b'}{\gamma_t'} \right)}{Y_{wF_{ht}} + \frac{Y_{wF}}{\gamma_t'} + 1 - \frac{\gamma_b'}{\gamma_t'}}
\end{align*}
\] (81)

24. The solution for the short berm case cannot be solved in the manner noted above because of the seepage \( Q_{BT} \). One must go to the levee landside toe and proceed stepwise to the berm toe. An initial value of \( h_t \) is assumed and after a series of stepwise computations, a value of \( h_a \) is calculated. This value will generally not be that of Equation 2. A new value of \( h_t \) is assumed and the process is repeated. This procedure is continued until the calculated value of \( h_a \) is sufficiently close to the value of \( h_a \) from Equation 2. The initial value of \( h_{2i} \) is found using

\[
\begin{align*}
\frac{h_{2i}}{\gamma_b'} &= h_t \left( \frac{\Delta x}{X + L_2} + 1 \right) - \frac{H\Delta x}{X + L_2} + \frac{c^2\Delta x^2 \left( h_t + \frac{Z_b\gamma_b'}{\gamma_t'} \right)}{Y_{wF_{ht}} + \frac{Y_{wF}}{\gamma_t'} + 1 - \frac{\gamma_b'}{\gamma_t'}}
\end{align*}
\] (82)
Knowing $h_t$, which is also $h_{31}$, and $h_{21}$, one can compute $h_{11}$ by using

$$h_1 = 2h_2 - h_3 + \frac{\Delta x^2}{2} \left( h_2 + \frac{Z_b \gamma'_b}{\gamma'_t} \right)$$

The values of the berm thickness at intervals of $\Delta x$ are computed using

$$t_x = \frac{h_1 \gamma'_w - Z_b \gamma'_b}{\gamma'_w + \gamma'_t}$$

In some cases the uplift safety factor $F$ may not be a constant but a function of $x$. For the latter case the value of $F$ will vary for each step. The flux $Q_{BT}/k_fD$ is

$$\frac{Q_{BT}}{k_fD} = \frac{h_2 - h_a}{\Delta x} - h_{ac}$$

25. An example is presented as follows:

$H = 30 \text{ ft}, \ Z_b = 5 \text{ ft}, \ D = 50 \text{ ft}, \ \frac{k_f}{k_b} = 200, \ \bar{K} = 10,$

$\bar{X} + \bar{L}_2 = 418.5 \text{ ft}, \ \frac{1}{c} = 223.6 \text{ ft} = \bar{L}_S, \ \bar{E} = 150 \text{ ft},$

$h_a = 1.5, \ \gamma_w = \gamma'_b = \gamma'_t = 62.4 \text{ lb/cu ft}, \ \bar{V}_S = 1.0,$

$F = 1.5, \ \Delta x = 10 \text{ ft}$

$$h_{21} = h_t \left( \frac{418.5 + 10}{418.5} \right) - \frac{300}{418.5} + \frac{0.001(h_t + 5)}{0.03h_t + 2.4}$$

$$h_1 = 2h_2 - h_3 + \frac{0.002(h_2 + 5)}{0.03h_t + 2.4}$$

$$t_x = \frac{h_1 \times 1.5 - 5}{1.5 + 1} = 0.6h_1 - 2$$
Estimate $h_{t_i} = 13$ ft

* If $F = F_{LS}$ then for $\bar{K} > 1.0$, $b = t_B = 0$.
  If $F > F_{LS}$ then for $\bar{K} > 1.0$, $b = t_B > 0$.

\[
\frac{Q_{BT}}{k_f D} = \frac{5.58 - 5.00}{10} - \frac{5}{223.6} = 0.0356
\]

Case VIII, Berm with Constant Slope

26. The solution for this case is given in Supplement No. 1 for
the condition that $Q_{BT}$, the seepage up through the top blanket crack at the berm toe, is zero. The definition of $h_a$ requires revision to that of Equation 2 of this supplement to render the solution more general. The thickness of the berm $t_x$ at point $x$ is

$$t_x = t - (t - b) \frac{x}{B} \quad (86)$$

The thickness of the berm toe $b$ at $x = B$ is

$$b = \frac{Z_b \left( \frac{\gamma_b Z_b}{\gamma_t Z_{LS}} - \overline{K} \right)}{1 + \frac{\gamma_w B}{\gamma_t' \gamma_t}} \quad (87)$$

for $\overline{K}$ less than 1.0. If

$$\frac{\gamma_b' F_B}{\gamma_t' Z_{LS}} \leq \overline{K} \quad (88)$$

then $b$ is zero. The expression for $y$ is revised (coordinate change) to

$$h_x - t + (t - b) \frac{x}{B} = y \quad (89)$$

The expression for $\xi$ is also revised for the same reason:

$$\xi = \overline{K} + \frac{t_x}{Z_b} = \overline{K} + \frac{t}{Z_b} - (t - b) \frac{x}{BZ_b} \quad (90)$$

The basic second-order differential equation is

$$\frac{d^2y}{dx^2} = \frac{\psi y}{\xi} \quad (91)$$

where

$$\psi = \left( \frac{Z_b Bc}{t - b} \right)^2 \overline{K} \quad (92)$$

3-26
The solutions for \( y \) and \( \frac{dy}{d\xi} \) are

\[
y = h_{\chi} - r_{\chi} = \omega_{\chi} [C_1 \ I_1 (\omega_{\chi}) + C_2 \ K_1 (\omega_{\chi})]
\]

\( \frac{dy}{d\xi} = 2 \nu[C_1 \ I_0 (\omega_{\chi}) - C_2 \ K_0 (\omega_{\chi})] \]

where

\[
\omega_{\chi} = 2 \nu \psi \xi
\]

The values of \( C_1 \) and \( C_2 \) are those of Supplement No. 1:

\[
C_1 = (h_a - b) K_0 (\omega_B) + \left[ \left( \frac{h_a - t - b}{Bc} \right) \sqrt{1 + \frac{b}{Z_b K}} \right] K_1 (\omega_B)
\]

and

\[
C_2 = (h_a - b) I_0 (\omega_B) - \left[ \left( \frac{h_a - t - b}{Bc} \right) \sqrt{1 + \frac{b}{Z_b K}} \right] I_1 (\omega_B)
\]

where

\[
\omega_B = \frac{2Z_b BcK}{t - b} \sqrt{1 + \frac{b}{Z_b K}}
\]

From Equation 37 of Supplement No. 1,

\[
H = h_c + (x + L_2) \left\{ \frac{t - b}{B} + \frac{2Z_b Bc}{t - b} \left[ C_1 \ I_0 (\omega_o) - C_2 \ K_0 (\omega_o) \right] \right\}
\]

3-27
where

\[ \omega_0 = \frac{2Z_b BcK}{t - b} \sqrt{1 + \frac{t}{Z_b K}} \]  

(100)

As noted in Supplement No. 1, values of the berm width \( B \) and the berm thickness \( t \) at \( x = 0 \) are assumed to calculate \( H \). These values are varied by trial until the calculated value of \( H \) agrees with the given value.

27. The uplift safety factor at point \( x \), \( F_x \), is not a constant but varies with a maximum between \( x = 0 \) and \( x = B \). For the combined berm and top blanket,

\[ F_x (\text{combined}) = \frac{Z_b \gamma'_b + t \gamma'_t}{(h - t)\gamma_w} \]  

(101)

and for the berm only

\[ F_x (\text{berm}) = \frac{(Z_b K + t \gamma'_t)\gamma'_t}{(h - t)\gamma_w} \]  

(102)

The lower value will control.

28. The basic second-order differential equation for the short berm is given by Equation 91 and the solutions are those of Equations 93 and 94. The evaluations of constants \( C_1 \) and \( C_2 \) are changed because \( Q_{BT} \) is not zero. At \( x = 0 \), \( h_x = h_t \) and \( y = h_t - t \),

\[ \frac{dh}{dx} = -\left( \frac{H - h_t}{X + L_2} \right) \]  

(103)

and

\[ \omega_0 = \frac{2Z_b BcK}{t - b} \sqrt{1 + \frac{t}{Z_b K}} \]  

(104)

Equation 93 becomes

\[ h_t - t = \omega_0 [C_1 I_1(\omega_0) + C_2 R_1(\omega_0)] \]  

(105)
Equation 94 becomes

\[
\frac{dy}{d\xi} = \frac{dy}{dx} \cdot \frac{dx}{d\xi} = \left( \frac{dh}{dx} + \frac{t - b}{B} \right) \left( -\frac{BZ_b}{b} \right) \left( \frac{H - h_t}{(x + L_2)} + \frac{t - b}{B} \right) = \left( \frac{H - h_t}{(x + L_2)} + \frac{t - b}{B} \right) \left( \frac{BZ_b}{b} \right)
\]

\[
= \left( \frac{H - h_t}{(x + L_2)} \right) \left( \frac{BZ_b}{b} \right) - Z_b = Z_b \left[ \frac{(H - h_t)}{(x + L_2)} - 1 \right]
\]

\[
= 2 \left( \frac{Z_b B c}{t - b} \right)^2 \frac{K}{C_1 I_0 (\omega_o) - C_2 K (\omega_o)}
\]

Solving the simultaneous Equations 105 and 106, one obtains

\[
C_1 = (h_t - t) K (\omega_o) + \left[ \left( \frac{H - h_t}{(x + L_2)} - 1 \right) \left( \frac{t - b}{Bc} \right) \sqrt{1 + \frac{t}{Z_b K}} \right] K (\omega_o)
\]

\[
C_2 = (h_t - t) I (\omega_o) - \left[ \left( \frac{H - h_t}{(x + L_2)} - 1 \right) \left( \frac{t - b}{Bc} \right) \sqrt{1 + \frac{t}{Z_b K}} \right] I (\omega_o)
\]

At \( x = 0 \), the uplift safety factor is

\[
F_o (\text{combined}) = \frac{(Z_b \gamma'_b + t \gamma'_t)}{(h_t - t) \gamma'_w} = F_o c
\]

and

\[
F_o (\text{berm only}) = \frac{(Z_b K + t) \gamma'_t}{(h_t - t) \gamma'_w} = F_o b
\]

From which

\[
h_t = \frac{Z_b \gamma'_b + t (\gamma'_t + \gamma'_w F_o)}{F_o c \gamma'_w}
\]
One must assume values of \( t \) and \( h_t \) for use in calculating \( C_1 \) and \( C_2 \). The value of \((h_t - t)\) can be readily calculated:

\[
(h_t - t) = \frac{Z_b \gamma _b' + t \gamma _t'}{F_0 \gamma _w} 
\]

or

\[
(h_t - t) = \frac{(Z_b \bar{K} + t) \gamma _t'}{F_0 \gamma _w} 
\]

using \( F_0 \) or \( F_0 \), whichever is controlling. Also

\[
(H - h_J) = H - (h_t - t) - t
\]

Values of \( t \) are assumed and \( C_1 \) and \( C_2 \) found. The correct value of \( t \) is that which gives a calculated value of \( h_a - b \) equal to that given, using

\[
(h_a - b) = \omega_B [C_1 \Omega_B(\omega_B) + C_2 \sigma_B(\omega_B)]
\]

where Equation 98 gives \( \omega_B \).

29. An example is presented as follows:

\[
H = 30 \text{ ft, } Z_b = 5 \text{ ft, } D = 50 \text{ ft, } \frac{k_f}{k_b} = 200 , \\
\bar{X} + L_2 = 418.5 \text{ ft, } \frac{1}{c} = 223.6 \text{ ft, } h_a = 5 \text{ ft, } B = 500 , \\
\gamma_w = \gamma'_b = \gamma'_t = 62.4 \text{ lb/cu ft, } F_{LS} = 1.0 , \\
F_0 = F_B = 1.5 , \quad \bar{K} = 0.1
\]
\[
b = \frac{5 \left( \frac{1.5 \times 62.4}{1 \times 62.4} - 0.1 \right)}{1 + \frac{62.4 \times 1.5}{62.4}} = 2.8 \text{ ft}
\]

\[
(h_a - b) = 5 - 2.8 = 2.2 \text{ ft}
\]

\[
(h_t - t) = \frac{(5 \times 0.1 + t)62.4}{1.5 \times 62.4} = \frac{0.5 + t}{1.5}
\]

\[
\omega_B = \frac{2 \times 5 \times 500 \times 0.1}{223.6(t - 2.8)} \sqrt{1 + 2 \times 2.8} = \frac{500\sqrt{6.6}}{223.6(t - 2.8)}
\]

\[
\omega_o = \frac{2 \times 5 \times 500 \times 0.1}{223.6(t - 2.8)} \sqrt{1 + 2t} = \frac{500\sqrt{1 + 2t}}{223.6(t - 2.8)}
\]

\[
\omega_w = \frac{2 \times 5 \times 500 \times 0.1}{223.6(t - 2.8)} \sqrt{1 + 2t - \frac{(t - 2.8)x}{500 \times 5 \times 0.1}}
\]

For various values of \( t \), the following results occur:

By interpolation \( t = 10.744 \) ft

\[
\omega_w = \frac{500}{223.6(10.744 - 2.8)} \sqrt{1 + 2 \times 10.744 - \frac{(10.744 - 2.8)x}{500 \times 5 \times 0.1}}
\]

\[
t_x = \frac{10.744 - (10.744 - 2.8)x}{500}
\]

* Coefficient of \( K_1(\omega_o) \) and \( I_1(\omega_o) \) of Equations 107 and 108, respectively.

3-31
The solution for a short berm for this case is very sensitive to the value of t.

### Conclusions

30. The conclusions of the main report and Supplements No. 1 and 2 remain unchanged. Solutions are presented in this supplement for a coordinate system having an origin at the levee landside toe and that is positive landward. The solutions are more general by having the uplift safety factor for the top blanket at the berm toe different than that for either the berm or the combined berm and top blanket at the berm toe.
31. Solutions are also presented for berms which are shorter than regular berms. The uplift safety factor for the top blanket $F_{LS}$ at the berm toe is assumed to be unity and a crack occurs in the top blanket at the berm toe parallel to the berm toe. The seepage up through the crack $Q_{BT}$ is assumed to occur. While piping at this crack is not precluded, it is assumed that for a given flood no serious damage will occur. For such berms, it may be desirable to install a trench drain along the berm toe.

32. Some of the solutions are explicit and direct; others are implicit and require a hunt-and-seek technique to obtain answers. Some solutions are very sensitive to variations of the variables and require a fair number of significant places in the numerical values used. The final results are given to three figures, which may be too many figures. Considering the simplifying assumptions used, the solutions presented are highly approximate to real situations and should be used only as a guide to the designer's judgement. The solutions given are deterministic. It is suggested that a probabilistic approach be used in design.
Appendix A: Notation

\( \bar{A} \)  
A constant (see Equation 67)

\( b \)  
Thickness of berm at the landside toe

\( B \)  
Seepage berm width from the landside levee toe to the landside berm toe

\( c \)  
\((k_b/k_DZ_b)^{1/2}\)

\( c_1, c_2, c_3, c_4, c_5, c_6 \)  
Constants

\( \bar{C} \)  
A constant (see Equation 68)

\( D \)  
Pervious foundation thickness

\( \bar{D} \)  
A constant (see Equation 69)

\( e \)  
2.71828

\( F_B \)  
Uplift safety factor at landside berm toe

\( F_{LS} \)  
Uplift safety factor for top semipervious blanket at berm toe

\( F_o \)  
Uplift safety factor at landside levee toe

\( F_{OB} \)  
Uplift safety factor at levee landside toe for berm only (\( x = 0 \))

\( F_{oc} \)  
Uplift safety factor at levee landside toe for combined berm and top blanket (\( x = 0 \))

\( F_x \)  
Uplift safety factor at point x

\( h \)  
Seepage uplift head at base of top blanket at point x, referenced to top of top blanket

\( h_a \)  
Allowable seepage uplift head at the landside berm toe (measured at base of top blanket referenced to top of top blanket)

\( H \)  
Net hydraulic head between river flood level and the landside upper surface of the top blanket

\( i \)  
Seepage gradient
\( I_0() \) Modified Bessel function, first kind, zero order

\( I_1() \) Modified Bessel function, first kind, first order

\( k_b \) Vertical permeability coefficient of top blanket

\( k_f \) Horizontal coefficient of permeability of the previous foundation

\( k_t \) Vertical permeability coefficient of berm

\( \bar{K} \) Permeability ratio of berm to top blanket, equals \( k_t/k_b \)

\( K_0() \) Modified Bessel function, second kind, zero order

\( K_1() \) Modified Bessel function, second kind, first order

\( L_1 \) Width of riverside top blanket measured from riverside levee toe to riverbank

\( L_2 \) Base width of levee

\( L_{LS} \) Effective length of landside top blanket measured landward from berm toe

\( Q_B \) Seepage per unit length of levee in the previous foundation at berm toe (\( x = B \))

\( Q_{BT} \) Seepage per unit length of levee flowing up through crack in the top semipervious blanket at berm toe

\( Q_{LS} \) Seepage per unit length of levee in the pervious foundation beyond the berm toe

\( t \) Maximum berm thickness at landside levee toe

\( t_x \) Berm thickness at point \( x \)

\( x \) Horizontal distance riverward of landside berm toe; may also be a mathematical variable (see Appendix B, Supplement No. 1)

\( \bar{X} \) Effective length of riverside top blanket
