20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This document contains the results of tests performed on the M-226, HC Grenades and Launcher in accordance with U.S. Army Technical Bulletin 700-2, Change 1, Chapter 4 with the following results: Detonation Test "A" - No propagation within the single container; Detonation Test "B" - No propagation between shipping container; and External Heat Test "C" - No explosion.		

## PREFACE

The work described in this report was authorized under US Army MIPR B5031 and Technical Work Request (TWR) EA 500 Rev. A. It was performed at the NASA National Space Technology Laboratories (NSTL) for the Edgewood Arsenal Resident Laboratory (EARL) and NASA-NSTL by the General Electric Company under Contract NAS8-27750. This work was initiated on March 10, 1975 and completed March 24, 1975.

Reproduction of this document in whole or in part is prohibited except with permission of Commander, Edgewood Arsenal, Attn: SAREA-TS-R, Aberdeen Proving Ground, Maryland; however, DDC is authorized to reproduce the document for United States Government purposes.

The use of trade names in this report does not constitute an official endorsement or approval of the use of such commercial hardware or software. This report may not be cited for purposes of advertisement.

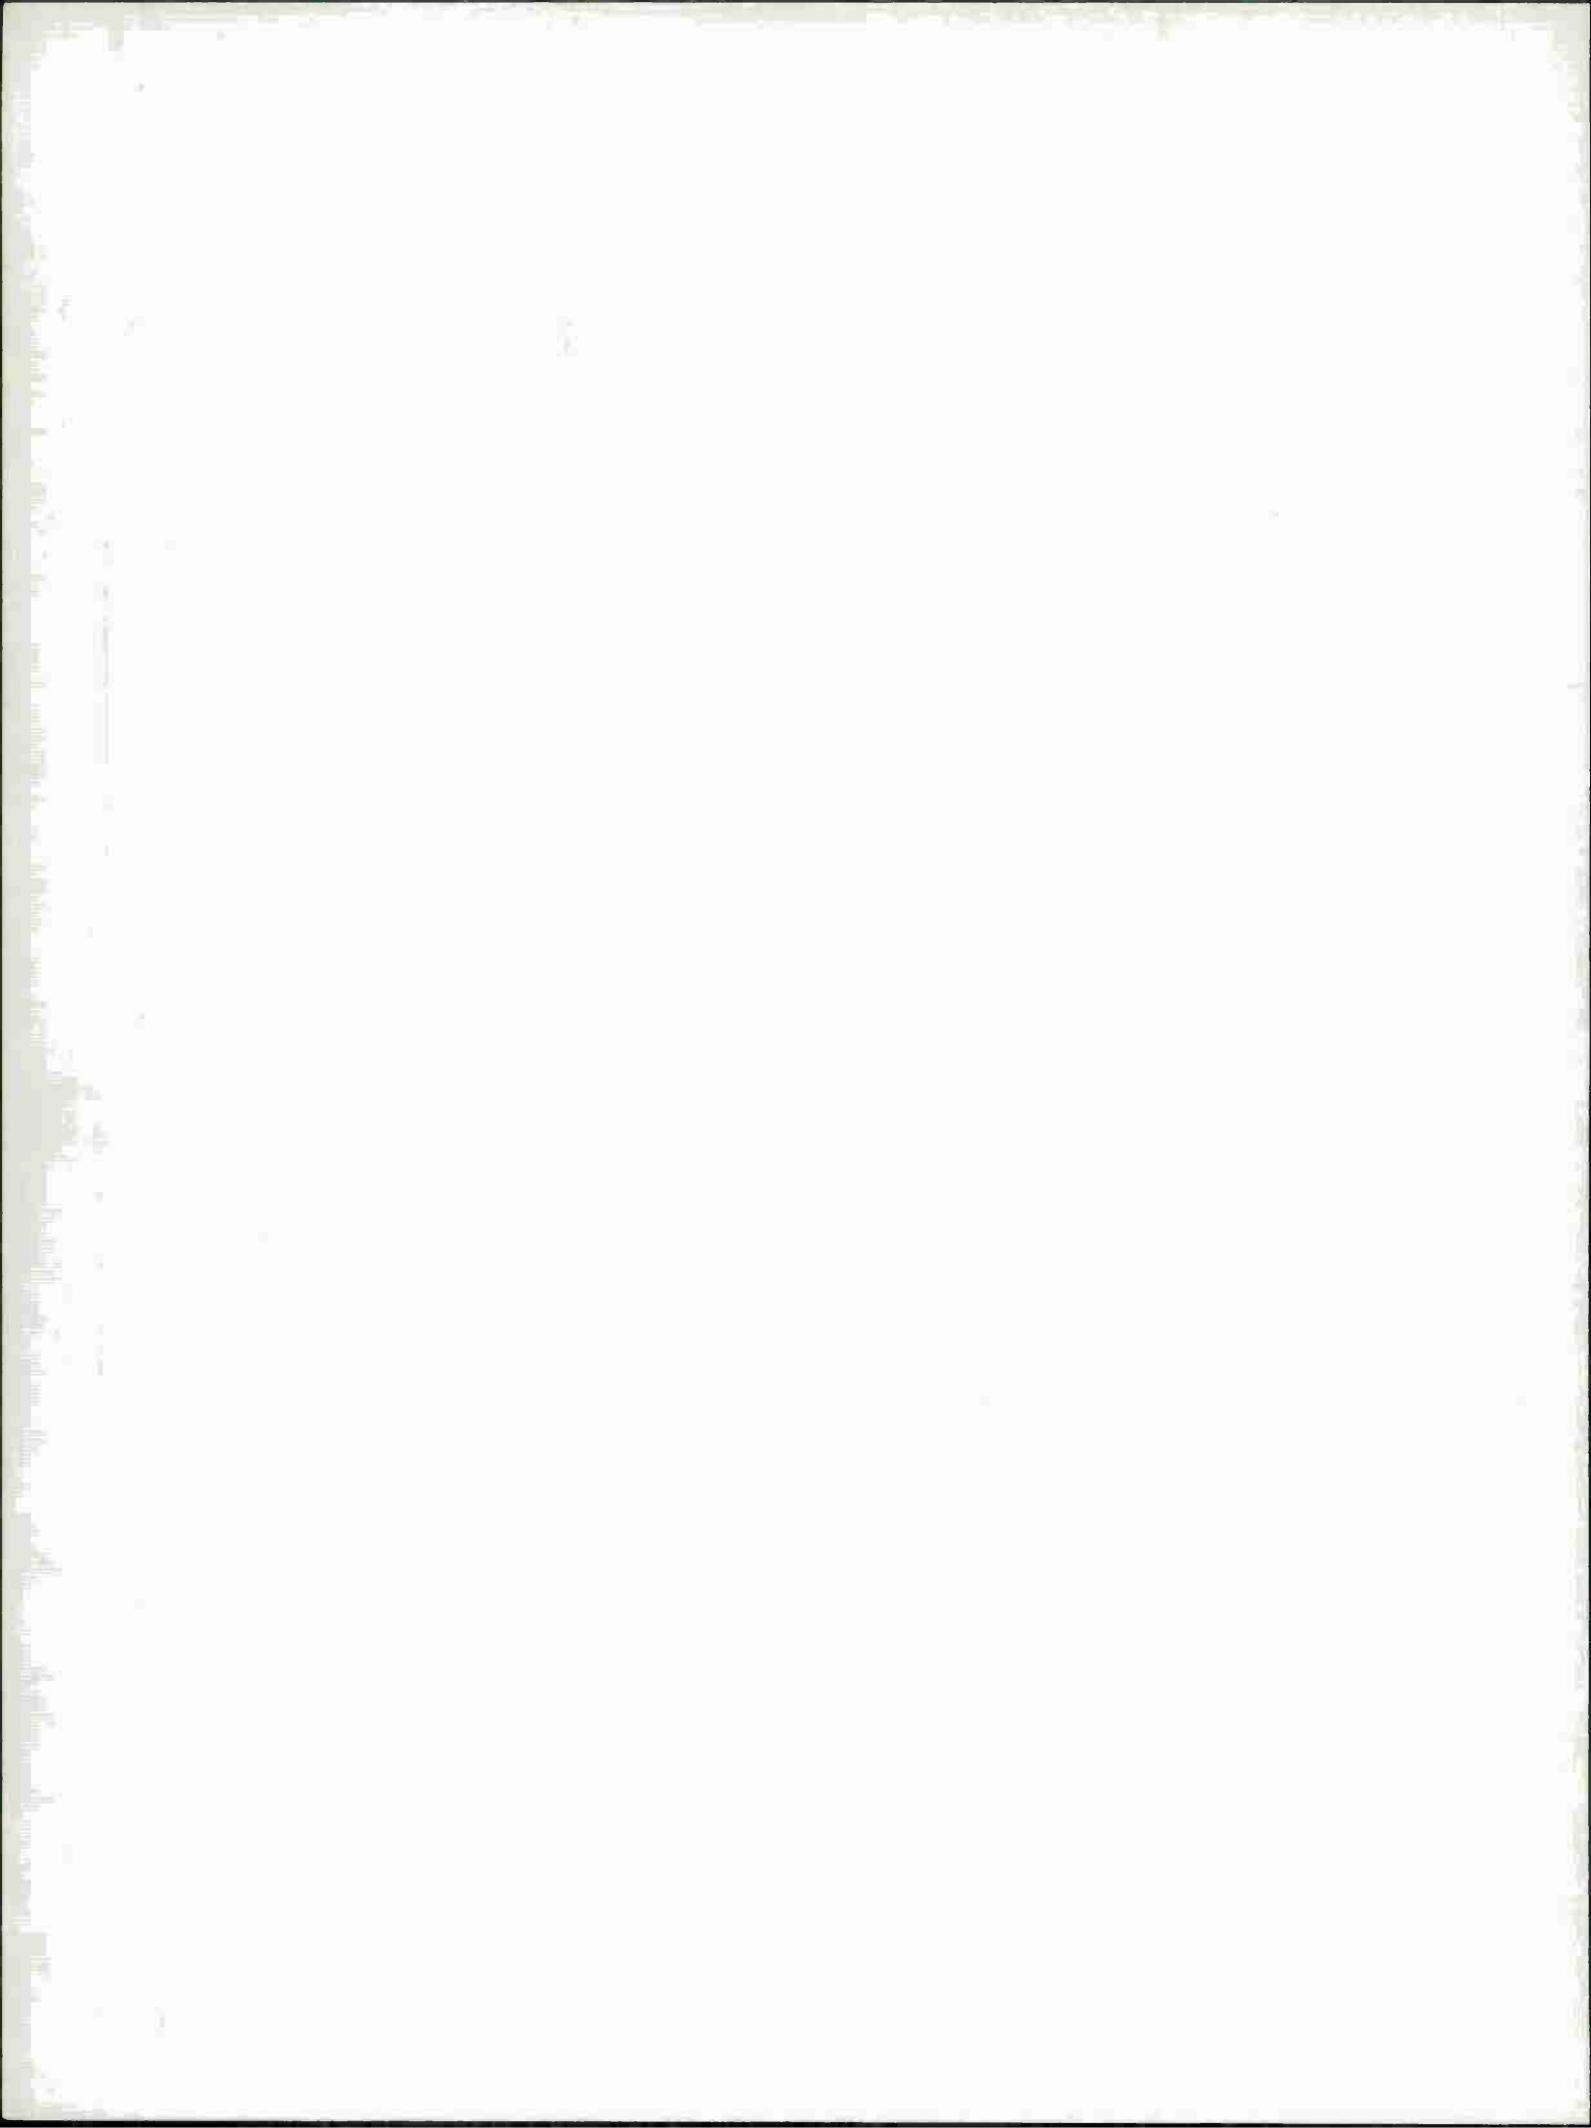

The information in this document has not been cleared for release to the general public.

EXPLOSIVE CLASSIFICATION TESTING OF PYROTECHNIC END ITEM  
M-226, HC GRENADES AND LAUNCHER

1.0 INTRODUCTION

1.1 Objective. The objective of this study was to provide results of the M-226, HC Grenades and Launcher tendency to propagate within a single shipping container, between shipping containers, and the reaction resulting from burning the munitions in an intense fire. The specific tests delineated in TB 700-2, Change 1, Chapter 4 were:

- Detonation Test "A"
- Detonation Test "B"
- External Heat Test "C"

1.2 Authority. The work described in this report was authorized by TWR EA-5500A, Task 3.

1.3 Background. Evaluation of pyrotechnic end item munitions is currently accomplished through test data obtained from specific tests performed in accordance with Chapter 4, TB 700-2. Chapter 4 provides test requirements for pyrotechnic end item munitions manufactured, packaged, and ready for field use.

The results of tests may be utilized by cognizant Department of Defense/Department of Transportation agencies to assign hazards classification and compatibility for transportation and storage of end item munitions.

2.0 TECHNICAL APPROACH

2.1 Background. The M-226 grenades and launcher assembly comprises two AN-M8, HC grenades placed in a sabot inside the launcher and is primed by a M29A1 percussion primer which in turn initiates the M-225 propulsion cartridge. A total of eight assemblies are then placed in packing composed of a molded polystyrene inner and outer cell with plastic foam per Drawing Number D13-12-22-23 and bound in a wirebound wooden box per PPP-B-585, Type I, Class 3, Style 2. Twenty of these boxes are placed on a pallet per Drawing D13-12-30 and readied for shipment.

For the purpose of this report, the shipping configuration is defined as a single wire-bound container.

2.2 End Item Munition Tests. Detonation test "A", was conducted on the assembly of the M-226, HC grenades and launcher in the single container configuration to determine if functioning of one grenade would cause additional launchers within the container to function. The grenade furthest from the propelling cartridge within the launcher was primed with an electric match head igniter. The donor round was located in the bottom row of the inner

cell (see figures 1 and 2 for method of priming and donor location).

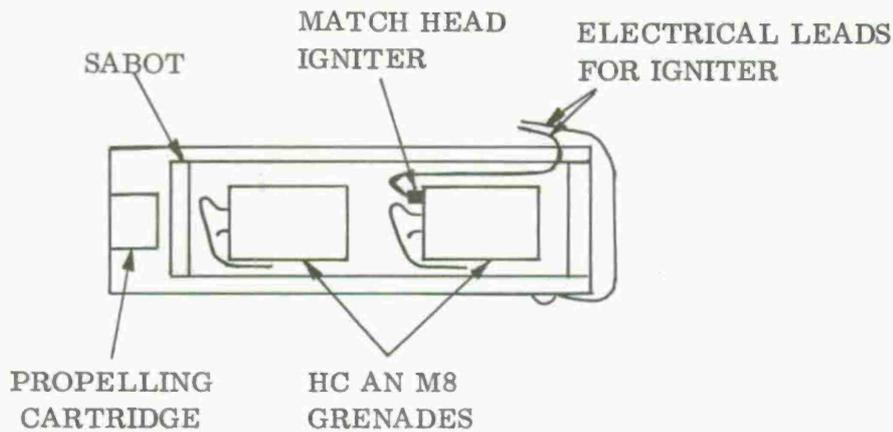

Figure 1. Priming of Donor Round

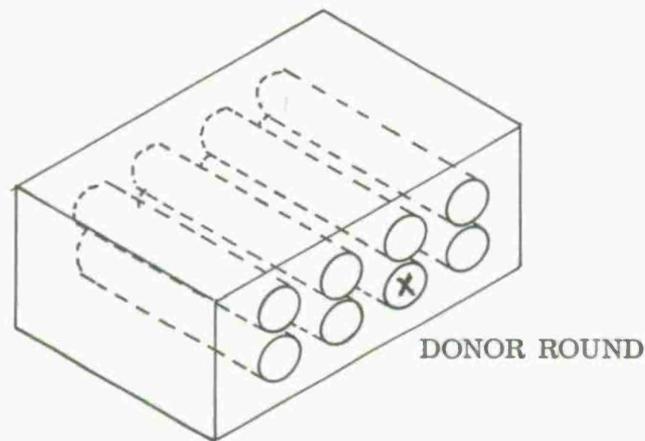

Figure 2. Location of Donor Round in Container

The test was conducted five times to determine:

- Propagation between donor and acceptor rounds
- Blast overpressure
- Fragmentation dispersal from container rupture.

An additional test was conducted by initiating the M29A1 percussion primer with a striker. The test setup is shown in figure 3. The donor round was located in the bottom row of the inner cell.

Detonation test "B" was conducted on the M-226, HC grenades and launcher in a multiple container configuration to determine if functioning of donor launcher and grenades would result in functioning of the donor grenades and or communication to the adjacent containers. The donor round was initiated by striking the M29A1 percussion primer in a manner similar

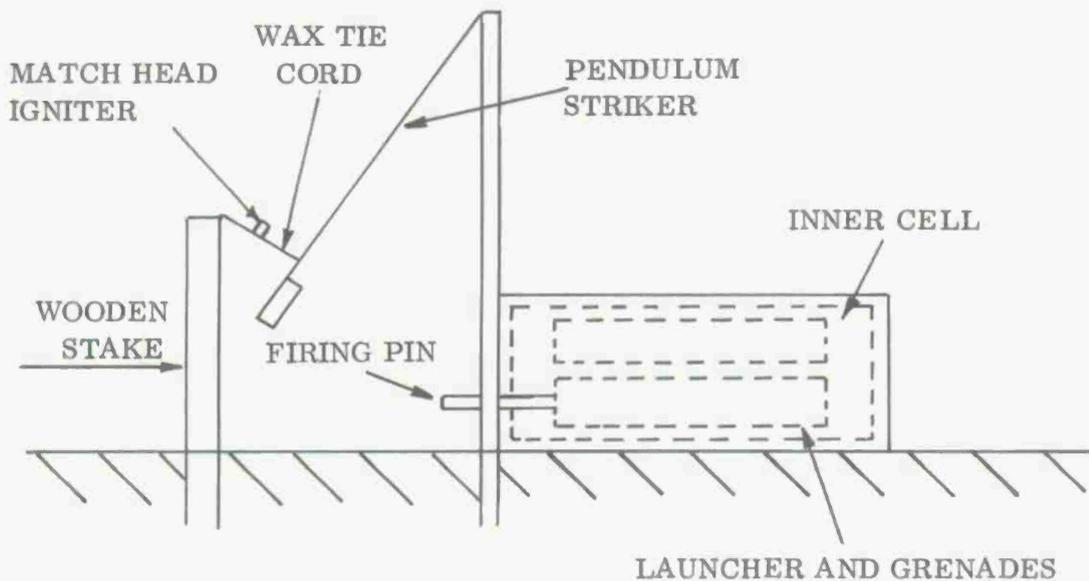

Figure 3. Self Priming of Tests A & B Configuration Using Pendulum Striker

to that described in the "A" test configuration (figure 3). The acceptor container was positioned in a manner which provided minimum separation between donor and acceptor launchers in the two packing containers. The test was conducted to determine if propagation between containers occurred, if the donor grenades functioned, and if fire and fragmentation hazards were evident.

External heat test "C" (open flame) is designed to simulate a condition where four single packing containers of M-226, HC grenades and launcher are completely enveloped in a hot flame. The four containers were arranged to approximate a cube. The stack of four containers was placed in a crib of wood approximately 30 inches high. The interior of the crib was filled with scrap lumber. The crib and stack of M-226, HC grenades and launcher were then covered by additional scrap lumber and doused with 55 gallons of diesel fuel. Ignition was effected by two electric match head igniters, each boosted with 10 grains of UTC 3001 propellant, placed on opposite sides of the crib base. This test was performed to determine if an explosion would result from the intense heat or open flame.

**2.3 Instrumentation.** A total of four (each) Susquehanna ST-7 piezoelectric transducers were deployed in a 90 degree array at a distance of 15.6 feet from the center of the end item munition assembly, with an expected blast overpressure of five. The transducers and Blomation recorders were calibrated for five psig full-scale with the trigger levels of the Blomations set at 0.5 psig to record the minimum required pressure. Typical transducer placement is shown in figure 4. In the event of blast overpressure occurring as the result of the M-226, HC grenades and launcher functioning, the blast overpressure profile would be mapped in accordance with guidelines set forth in Chapter 2, Paragraph 4a of TB 700-2.

Twenty-four frames per second, documentary colored motion pictures were taken during each test with a Mitchell camera placed approximately 150 feet from the test end item with

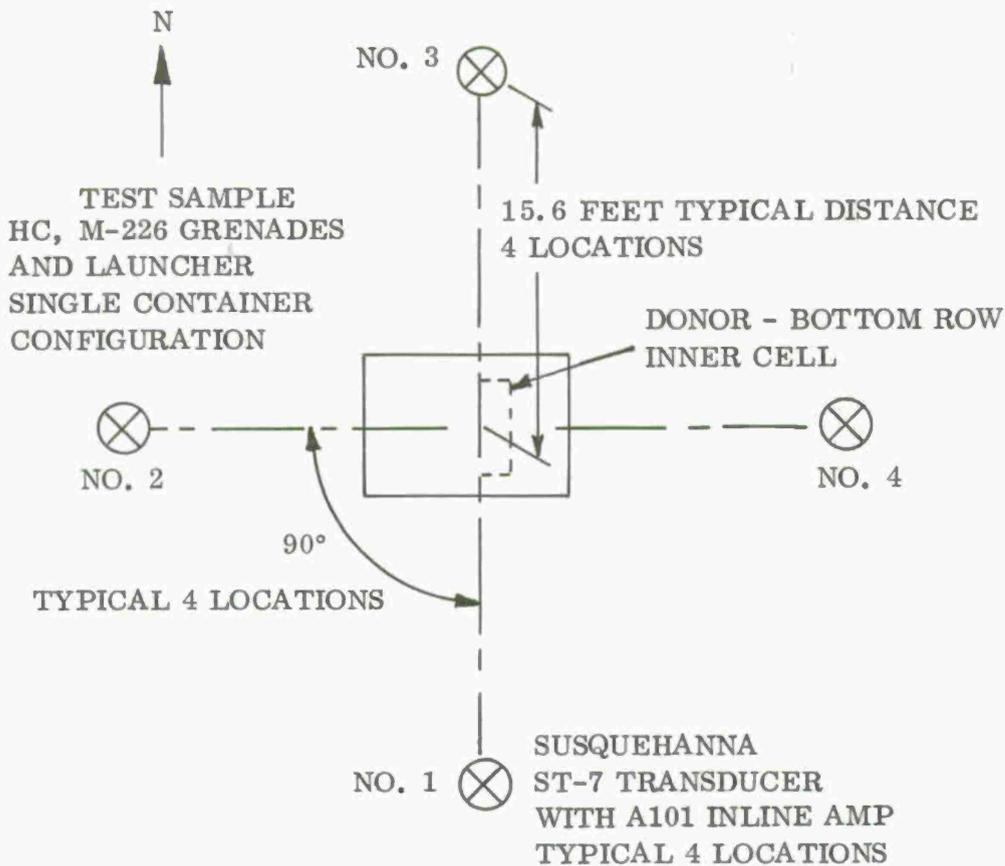

Figure 4. Typical Blast Overpressure Measurement Transducer Placement for Detonation Test "A"

a viewing area of 25 feet either side of box. Figure 5 shows a typical motion picture setup for detonation tests "A", "B", and external heat test "C". Before and after still black and white photographs were taken of setup priming and results and are included in this report, as appendix A.

2.4 Discussion. While preparing the donor rounds for test, it was noted that two possible hazardous conditions could exist:

- The percussion primer, though recessed in the round, is exposed to possible sharp pointed object that upon impact could function as normally intended.
- Since the launcher is constructed of an insulator material, the primer and grenade are insulated from one another, and the launchers are packaged in a styrofoam-type packing, it is conceivable that an electrostatic charge can be developed.

The discharge paths, however, can occur only through the exposed primer at one end of the launcher and the metal cap at the opposite end of the primer. Further tests may be warranted to determine electrostatic sensitivity.

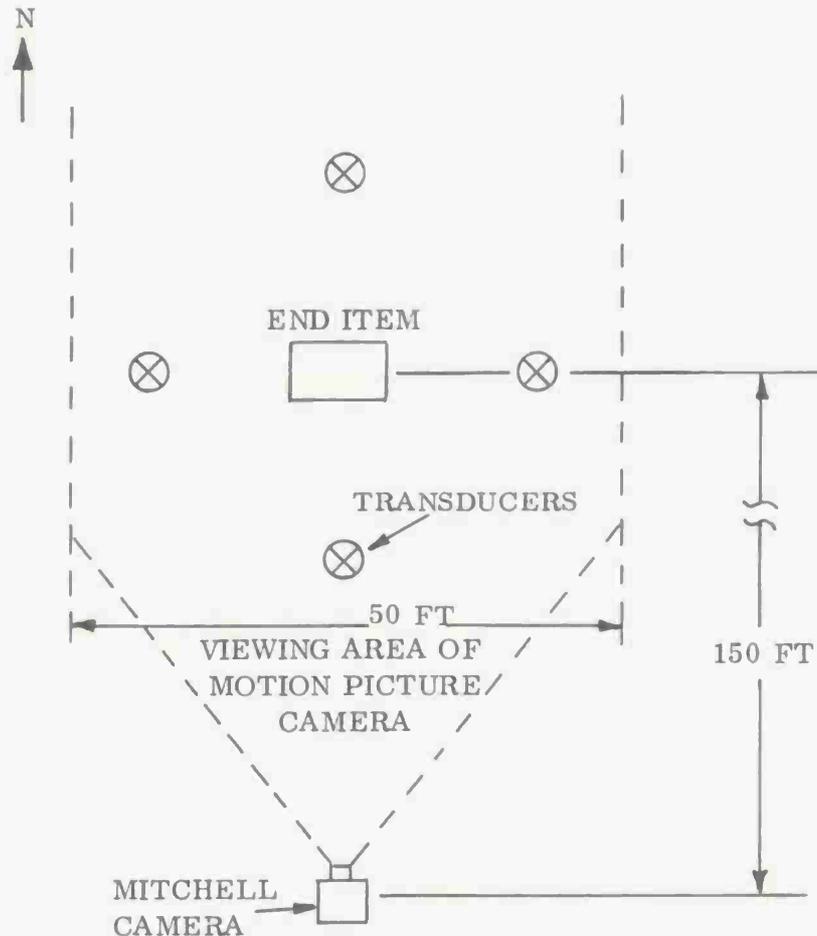

Figure 5. Typical Motion Picture Camera Set-Up for Detonation Tests A & B and External Heat Test C

### 3.0 RESULTS

3.1 Detonation Test "A" (Grenade Primed). The assembly of the M-226, HC grenades and launcher in the single packing container configuration was subjected to five (each) standard end item detonation tests "A". The AN-M8 HC white smoke grenade furthest from the M29A1 percussion primer was initiated utilizing an electric match head igniter. In each case, the donor grenade functioned, propagated to the second grenade in the launcher, but failed to propagate to the next launcher within the container. There was no measurable blast overpressure (more than 0.5 psig) at a distance of 15.6 feet, nor was there any discernible report from functioning. Therefore, this test series precluded the need for standard end item detonation test "B" discussed in the next paragraph.

3.2 Detonation Test "A" (Self Primed). The assembly of M-226, HC grenades and launcher in the single packing container was subjected to a single standard end item detonation test "A". The M29A1 percussion primer was initiated by the pendulum striker to approximate conditions of rough handling. The test resulted in the functioning of the launcher, a hole in the box approximately 4 inches in diameter in front of the launcher, and the grenade

being propelled 28 and 41 feet, respectively. The two grenades functioned in a normal manner. Appendix B presents the diagram of results. There was no measurable overpressure greater than 0.5 psig at 15.6 feet. This test was conducted only once as defined by interpretation of test results per TB 700-2, i. e., damage to packing containers dictates that detonation test "B" be performed.

3.3 Detonation Test "B" (Self Primed). The assembly of the M-226, HC grenades and launcher was subjected to a single standard end item detonation test "B". The test was conducted by functioning the M29A1 percussion primer with the pendulum striker. The test resulted in no functioning of the grenades, no communication or propagation between containers, and no outside damage to the donor box. Based upon the test results and with approval of the Edgewood Safety Representative/Project Engineer, no additional detonation tests "B" were performed.

3.4 External Heat Test "C". Four (each) wirebound containers were placed inside of a pyre, doused with 55 gallons of diesel fuel in accordance with Chapter 4, Table 6 of TB 700-2, and consumed by intense heat. No explosion or expulsion of any of the grenades resulted from the exposure to the pyre.

#### 4.0 CONCLUSIONS

The results of these tests on the assembly of the M-226, HC grenades and launcher indicate that no propagation occurred within the packing container, between packing containers, and no explosion resulted when subjected to intense heat and open flame.

#### 5.0 RECOMMENDATIONS

Further tests should be performed to evaluate the electrostatic sensitivity of the M-226 rounds when packaged in the specified electrically insulating material.

APPENDIX A  
SELECTED PHOTOGRAPHS

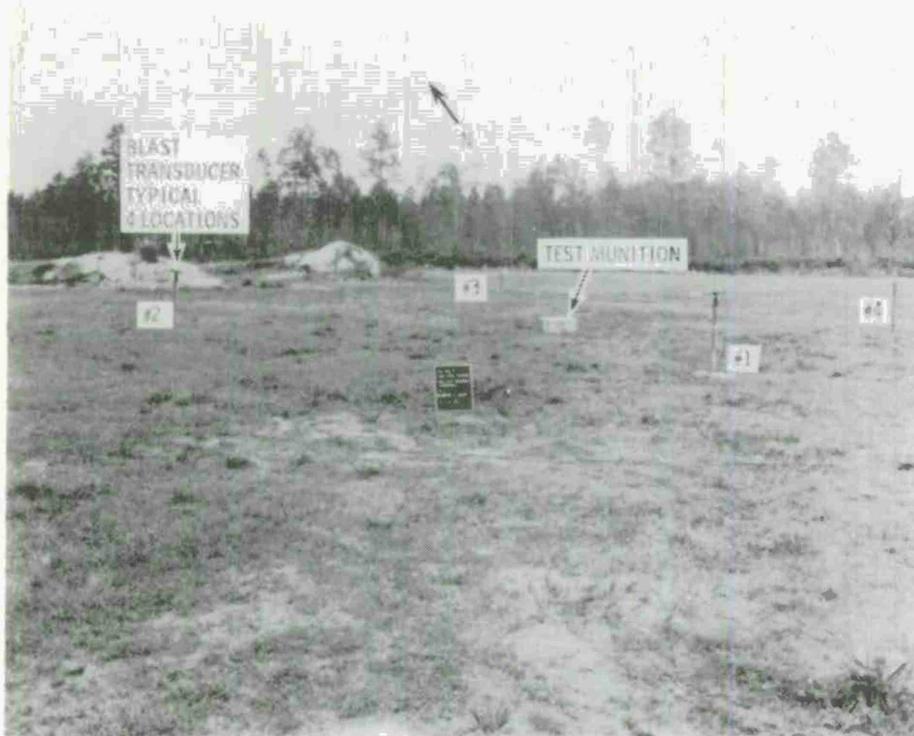

The photographs appearing in this Appendix were selected as being representative of the photographic documentation obtained in pre-test and post-test photographs.

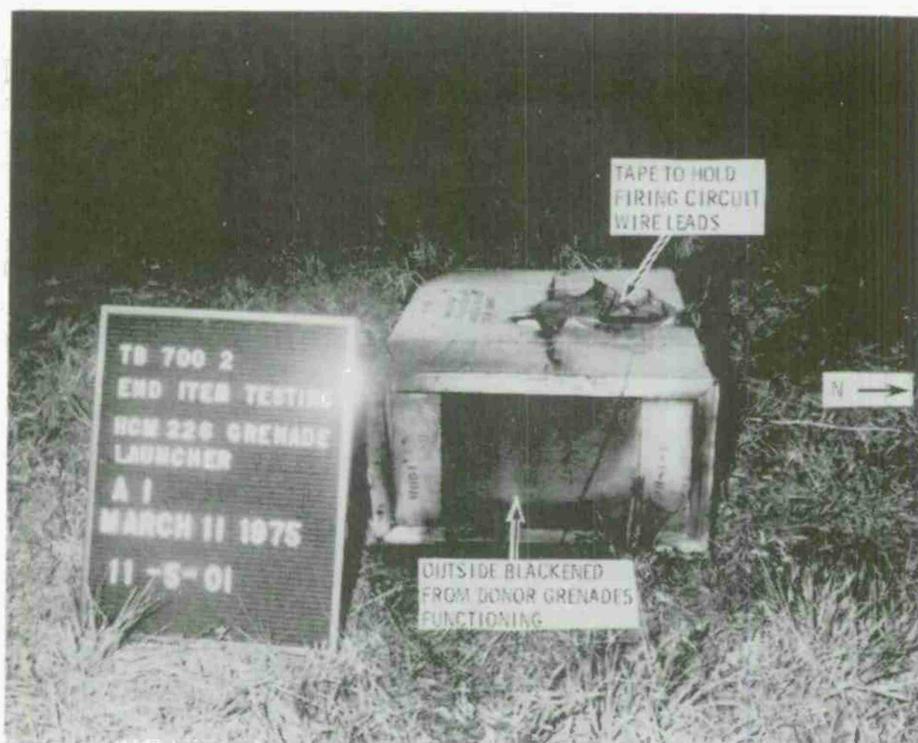

Typical Test Setup for a Standard TB700-2 End Item Detonation Test "A"

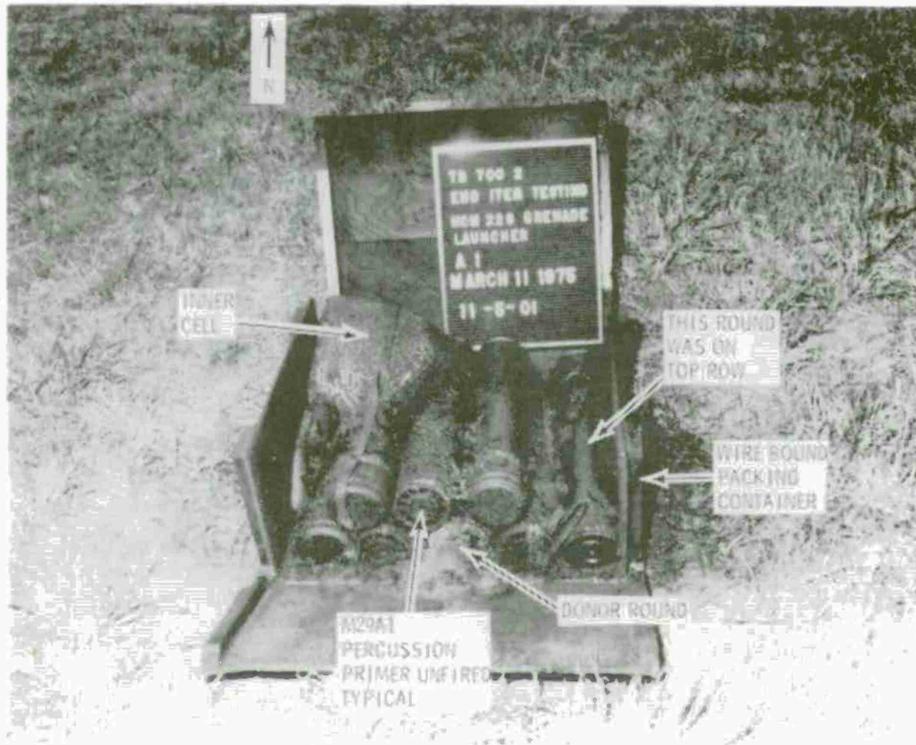

Typical Donor Location for End Item Detonation Test "A"

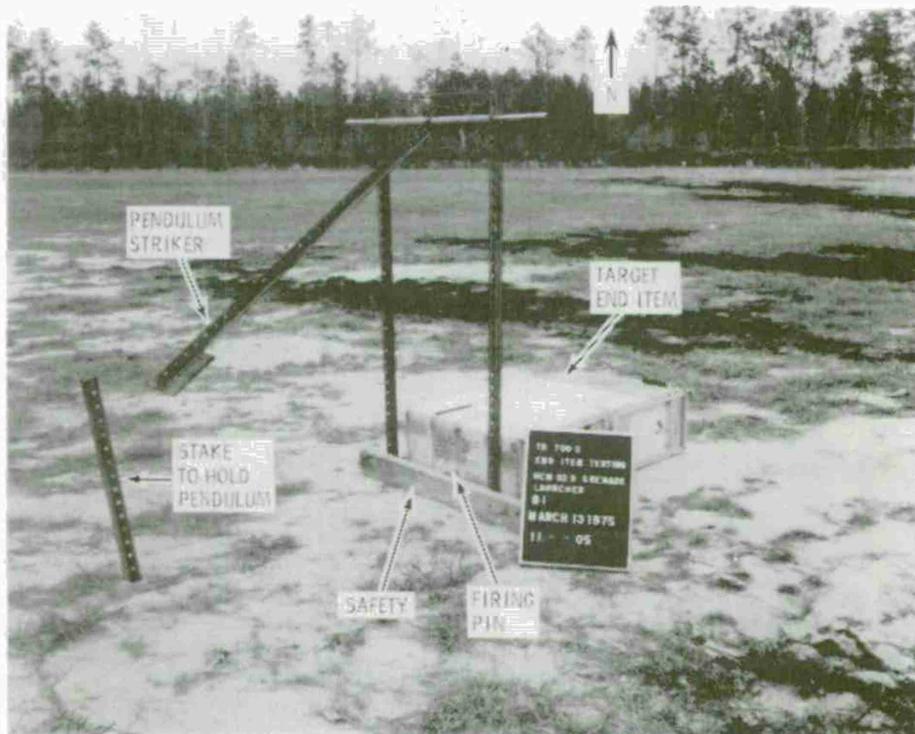

Typical Instrumentation Setup Showing Transducer Locations at 15.6 Feet - 90° Array

Typical Results of Detonation Test "A" Showing Outside of Packing Crate

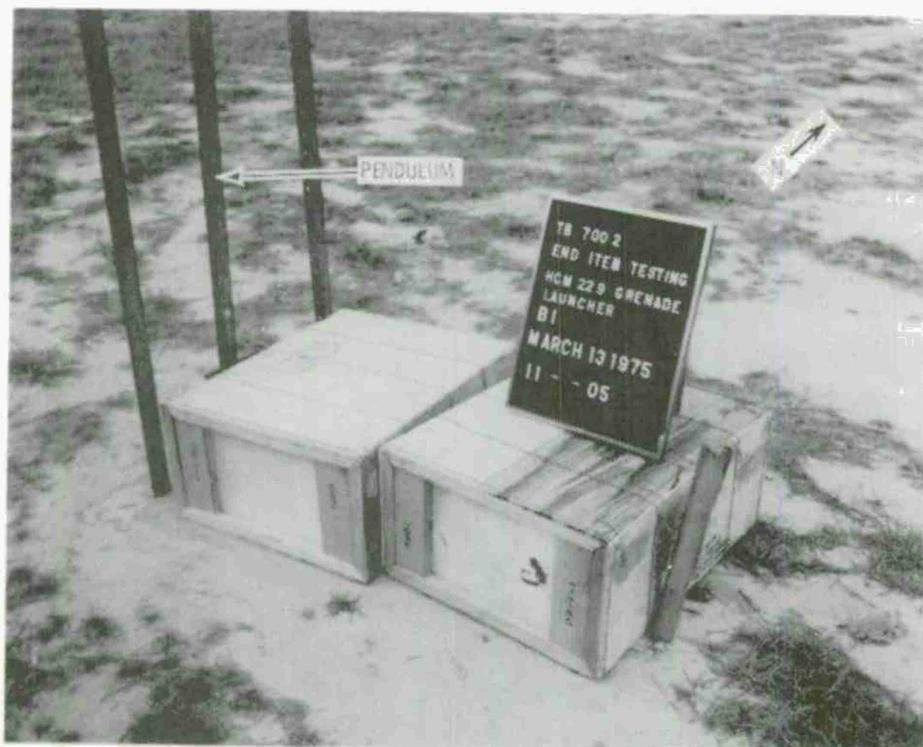

Typical Results of Detonation Test "A" Showing Interior of Packing Crate

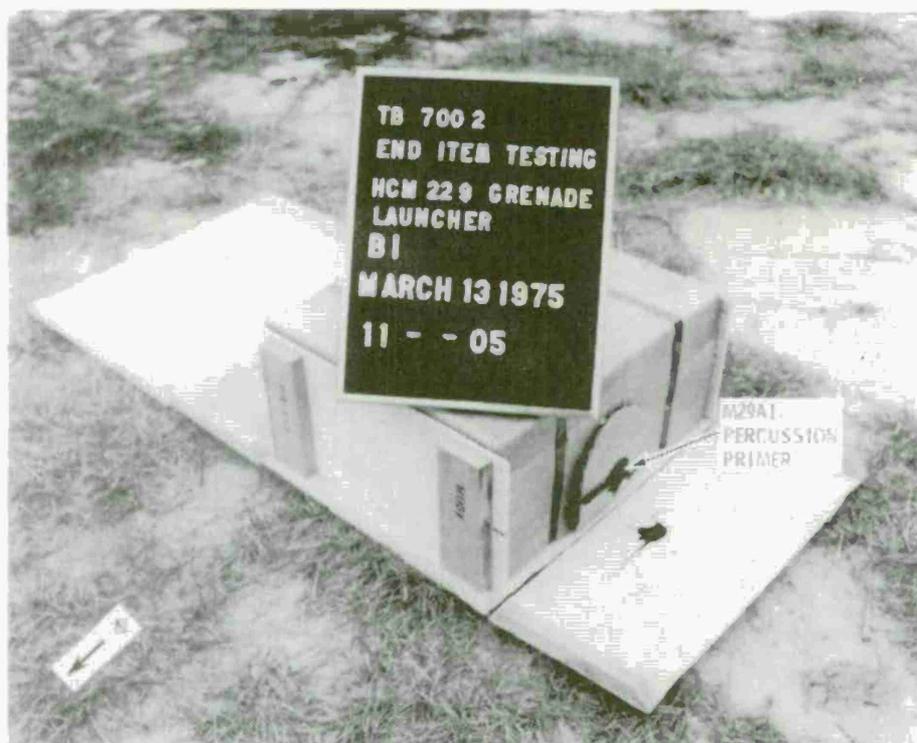

Typical Set up for Self-Primed Detonation Tests "A" and "B" Using Pendulum Striker

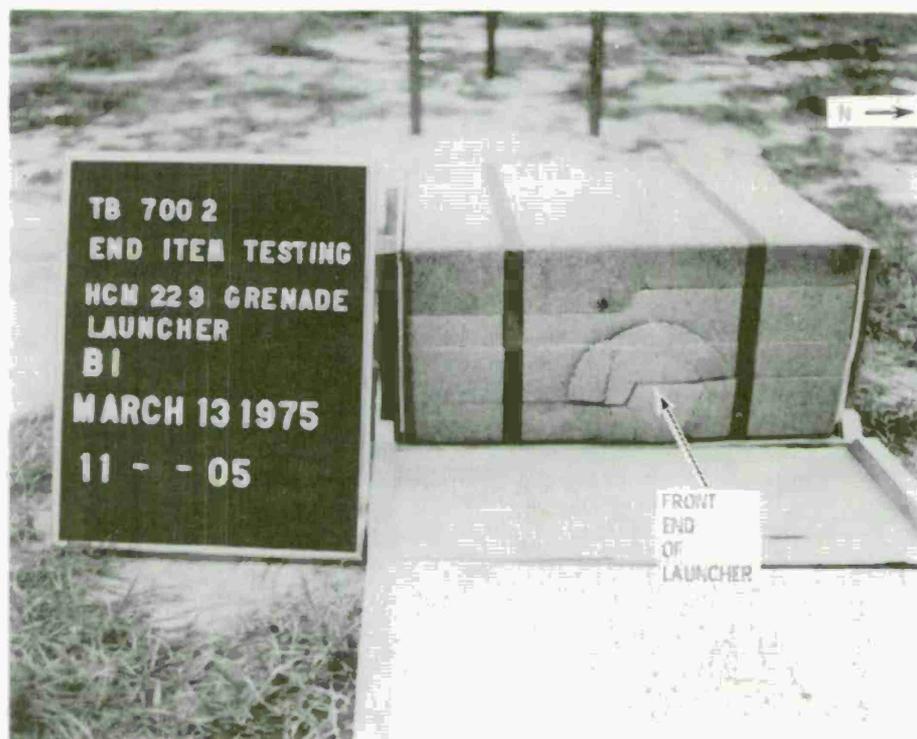

Test Results of Self-Primed Detonation Test "A"

Result of Self-Primed Detonation Test "B" Showing Exterior of Packing Crate

Results of Self-Primed Detonation Test "B" Showing Inner Cell at Ignition Source

Results of Self-Primed Detonation Test "B" Showing Inner Cell of Launcher Tube

Typical Test Setup for End Item External Heat Test "C"

Results of External Heat Test "C" - No Grenades or Launchers Outside of Pyre
