This paper is part of the following report:

TITLE: Verification and Validation Data for Computational Unsteady Aerodynamics [Donnees de verification et de valadation pour l’aerodynamique instationnaire numerique]

To order the complete compilation report, use: ADA390566

The component part is provided here to allow users access to individually authored sections of proceedings, annals, symposia, ect. However, the component should be considered within the context of the overall compilation report and not as a stand-alone technical report.

The following component part numbers comprise the compilation report:

ADP010704 thru ADP010735
INTRODUCTION

The tests described were carried out in the University of Glasgow's 'Handley Page' wind tunnel, which is a closed-return, low-speed type with a 2.13m x 1.61m octagonal working section (Fig 3). The model span and chord were 1.61m and 0.55m respectively, and its construction was of a fibreglass skin filled with an epoxy foam bonded to an aluminium spar. The model was pitched about the quarter chord by a linear hydraulic actuator and crank mechanism. The actuator was a Unidyne 907/1 type with a dynamic thrust of 6.1kN controlled by a MOOG 76 series 450 servo valve. Thirty five Kulite 093-5 PSI G ultraminiature pressure transducers were installed below the skin in a removable pod at the centre-span of the model. The transducers were of the vented gauge type with one side open, via tubes, to ambient pressure outside the tunnel. Each transducer was fitted with a temperature compensation module to minimize changes in the zero-offset and sensitivity. Model incidence was determined using an angular potentiometer geared to the model's main spar. This provided feedback to the hydraulic actuator control system and the angle of incidence signal for the data recording system. The model incidence waveform was provided by a PC fitted with an ANALOGUE DEVICES RT 1815 input/output board. The dynamic pressure in the working section was determined by measuring the difference between the static pressure in the working section, just upstream of the model leading edge, and the static pressure in the settling chamber. These pressure tappings were connected to a Furness FC012 micromanometer which provided an analogue signal for the data acquisition module.

The model was tested with a view to an investigation of the dynamic stall vortex convection speed anomaly (ref 2, 4 and 10). The model was instrumented with 35 pressure transducers placed asymmetrically over the upper and lower surfaces at the mid-span of the model. A particularly high resolution around the leading edge was chosen. Two motion types were considered, namely ramp-up and ramp-down. The model was rotated about the quarter chord point. For the ramp-tests the model was pitched over a preset arc at a constant pitch rate. At low pitch rates excellent ramp-profiles were obtained, but at higher pitch rates acceleration and deceleration of the model produced non-linearities. For ramp tests each test case was performed 5 times, and the data were phase averaged to produce the results presented here.

FORMULARY

1 General Description of model

1.1 Designation Model 15
1.2 Type Nominally two-dimensional
1.3 Derivation Not applicable
1.4 Additional remarks None
1.5 References 6

2 Model Geometry

2.1 Planform Nominally two-dimensional
2.2 Aspect ratio 2.93
2.3 Leading edge sweep None
2.4 Trailing edge sweep None
2.5 Taper ratio No Taper
2.6 Twist No Twist
2.7 Wing centreline chord 0.55m
2.8 Semi-span of model 0.805m
2.9 Area of planform 0.8855m² gross wing area
2.10 Location of reference sections and definition of profiles Sikorsky SSC-A09 profile: 9%c thick, lightly cambered with 0.7%c leading edge radius (see table 2).
2.11 Lofting procedure between reference sections Constant section
2.12 Form of wing-body junction None
2.13 Form of wing tip Not applicable
2.14 Control surface details None
2.15 Additional remarks None
2.16 References 6, 7
3 Wind Tunnel

7 Instrumentation

7.1 Steady pressure
7.1.1 Position of orifices spanwise and chordwise
Chordwise only. See Table 3.
7.1.2 Type of measuring system
Thirty five Kulite 093-5 PSI G ultra-miniature pressure transducers mounted close to wing surface connected to 200 parallel channel data acquisition system.

7.2 Unsteady pressure
7.2.1 Position of orifices spanwise and chordwise
Chordwise only. See Table 3.
7.2.2 Diameter of orifices
1.0mm
7.2.3 Type of measuring system
Thirty five Kulite 093-5 PSI G ultra-miniature pressure transducers mounted close to wing surface connected to 200 parallel channel data acquisition system.
7.2.4 Type of transducers
Kulite CJQH-187 differential
7.2.5 Principle and accuracy of calibration
Steady state sensitivity from applied reference and calibration procedures. Accuracy as stated by manufacturer.

7.3 Model motion
7.3.1 Method of measuring motion reference coordinate
Quarter chord location specified by manufacture
7.3.2 Method of determining spatial mode of motion
Feedback from potentiometer geared to shaft.
7.3.3 Accuracy of measured motion
0.1°

7.4 Processing of unsteady measurements
7.4.1 Method of acquiring and processing measurements
35 individual Kulite sensors mounted close to wing surface connected to 200 parallel channel Bakker Electronics BE256 sample and hold modules. Signal conditioning modules on each individual channel. Gain and offset removal automatic. Acquired data downloaded to PC.
7.4.2 Type of analysis
Phase averaging of cycles. Five cycles for ramp function tests.
7.4.3 Unsteady pressure quantities obtained and accuracies achieved
Basic unsteady pressure signal. Cycle repeatability variable depending on amplitude and reduced pitch rate.
7.4.4 Method of integration to obtain forces
Trapezoidal rule

7.5 Additional remarks
None
7.6 References on techniques
None

8 Data presentation
8.1 Test cases for which data could be made available
Two motion types: Linear Ramp Up and Linear Ramp Down. Tests cover a range of reduced pitch rate. In total 54 test cases. All incidence variations about quarter chord.

8.2 Test cases for which data are included in this document
One motion type: Linear Ramp Up. Three test cases as detailed in Table 4. A series of plots are also presented which are illustrative of the data supplied in electronic form. Figure 4 shows a sample upper surface pressure distribution, $C_n$, $C_m$ and incidence history.

8.3 Steady pressures
None

8.4 Quasi-steady or steady perturbation pressures
No

8.5 Unsteady pressures
For all dynamic cases

8.6 Steady forces or moments
None

8.7 Quasi-steady or unsteady perturbation forces
No

8.8 Unsteady forces and moments
For all dynamic cases

8.9 Other forms in which data could be made available
None

8.10 Reference giving other representations of data
N/A

9 Comments on data

9.1 Accuracy

9.1.1 Mach number
±0.5%

9.1.2 Steady incidence
±0.1°

9.1.3 Reduced frequency
±0.5%

9.1.4 Steady pressure coefficients
±0.5%

9.1.5 Steady pressure derivatives
Not estimated

9.1.6 Unsteady pressure coefficients
±0.5%

9.2 Sensitivity to small changes of parameter
N/A

9.3 Non-linearities
N/A

9.4 Influence of tunnel total pressure
Not examined

9.5 Effects on data of uncertainty, or variation, in mode of model motion
N/A

9.6 Wall interference corrections
None

9.7 Other relevant tests on same model
None

9.8 Relevant tests on other models of nominally the same shapes
None

9.9 Any remarks relevant to comparison between experiment and theory
None

9.10 Additional remarks
The electronic data supplied with this report comprises three file types. The first file type contains the aerofoil co-ordinates. There is only one file of this type, and it is identified by the name ssca09_coords.dat. The second type contains the transducer coordinates. There is only one file of this type and it is identified by the name ssca09_xducers.dat. The last file type contains pressure data, and three examples are provided (described in table 4). The first 128 parameters are the run information data (described in table 5), and the remaining parameters are 1024 blocks each comprising the dynamic pressure, pressure coefficients (35 values) and angle of incidence. A MATLAB program to read in the data is listed in appendix A. The pressure transducer locations correspond to the order contained in the file ssca09_xducers.dat, which is the same as in table 3.
