DEVELOPING A STRATEGY OF ORGANIZATIONAL
CHANGE FOR THE DEPARTMENT OF STATE

Marshall W. Wiley*

The RAND Corporation, Santa Monica, California

INTRODUCTION

After ten years in the Foreign Service, I was assigned for a year to RAND, a nonprofit corporation engaged in policy-oriented research and analysis on national security and other public policy problems. While at RAND I had an opportunity to carry out research on the operation of the foreign affairs community and, more specifically, on the organization and management problems of the State Department. The RAND Corporation provided me with the necessary supporting facilities and a congenial interdisciplinary research atmosphere. It also gave me an opportunity to broaden my perspectives in a variety of areas relevant to foreign affairs but with which I had had little contact prior to coming to RAND.

In the following pages I will attempt to set forth some of the tentative conclusions I have reached. The paper begins with a short summary of my thinking. In the rest of the paper I attempt to explain the reasoning behind these conclusions and suggest some approaches that might be useful in dealing with these problems.

I owe a debt to many of my RAND colleagues who helped shape my thinking during the past months, but I would like to express my particular appreciation to Paul Hammond, Albert Williams, and Yehezkel Dror.

*Any views expressed in this paper are those of the author. They should not be interpreted as reflecting the views of The RAND Corporation or the official opinion or policy of any of its governmental or private research sponsors. Papers are reproduced by The RAND Corporation as a courtesy to members of its staff.
for their comments on the first draft of this paper and for the many stimulating discussions I have had with them. The responsibility for the conclusions reached herein is exclusively my own.
1. The State Department needs a carefully worked out policy of organizational change to enable it to play a more effective role in the foreign affairs community.

2. The new policy should place a high priority on improving the Department's capabilities in analysis and, on a somewhat different level, management. In both of these fields developments have been rapid since World War II.

New methods of analysis, many of which were originally developed to deal with national security issues, should be adapted to a broader range of foreign affairs problems. The managerial function of the Department should be strengthened to include monitoring the decision-making processes, identifying the points within the decision-making system where better analytic capabilities would improve the quality of the decisions, and determining how the required capabilities could best be obtained. The Department needs these improved capabilities in order to carry out its responsibilities as the President's principal advisor in foreign affairs at a time when the rapidly evolving technology of communications, transportation, data processing and weaponry have vastly increased the complexity of foreign affairs decision-making.

3. A major asset and, paradoxically, a major weakness of the State Department is the Foreign Service career personnel system. The system produces a steady supply of experienced and dedicated people, but, like any system based on an elite corps with a strong internal cultural tradition, it tends to resist innovation. This resistance has served to isolate the career service from recent developments in management and analysis.

4. Although informed and experienced judgment remains the central requirement for foreign affairs personnel, an improved capability for analysis is needed to supplement this requirement. Such a capability when properly used would (a) by systematic structuring of the underlying problems and assumptions, bring additional insights and understanding to complex foreign policy issues, and (b) improve the Department's ability to carry out its designated role in foreign affairs.

*The term "organizational change" is used in this Paper to signify a broad range of innovation, and it is not limited to mere structural modification in the organization.*
5. The concept of planning in foreign affairs should be revised to place more emphasis on the analysis of present and potential foreign policy issues and less on pre-packaging specific decisions under assumed future circumstances.

6. The "substantive" activity of the State Department needs a stronger managerial component. Previous Secretaries and Under Secretaries have viewed themselves primarily as senior foreign policy experts and advisors to the White House. This role has left them little time to function as senior managers of a complex organization with difficult managerial and organizational problems. There is a need for greater concern with the "process" of policy-making as opposed to the specific foreign policy issues that have traditionally monopolized most of the time and effort of "substantive" officers at all levels.

7. An important program is now underway to improve the Department's substantive information systems. This should be expanded to include the improvement of the management information systems. Since the flow of information is the life blood of the Department, decisions concerning the information flow are, in fact, basic decisions on how the Department will be organized and how its operations will be conducted. The present program should be broadened to include a thorough analysis of the Department's organization and decision-making processes. Such an analysis will be required if the improvements are to do more than mechanize the storage and retrieval of documents and cope more successfully with the more difficult problem of processing the ever-increasing avalanche of information into a more manageable form for the end users.

8. The new policy should direct itself to the task of developing a new concept of "professionalism" among foreign affairs personnel. This will require some change in attitudes among career personnel, more effective in-service training opportunities, and a reduction in the isolation of the career service from professional developments outside their own circle, particularly in the fields of management and analysis.

9. The specific responsibility for recommending a new organizational policy should be assigned to one senior official. His office
should also provide a focal point for (a) increased participation of
the career service in formulating the strategy and (b) increased con-
tact with organizations external to the Department (e.g., management
consultants, academic consultants, foundations, other governmental
agencies) that have had experience in dealing with the problem of im-
proving capabilities in other organizations.
THE NATURE OF THE PROBLEM

Since World War II, radical developments in the technology of communication, transportation, industrial production, and the weapons of war have brought fundamental alterations both in the nature of the international system and in the nature of our own society. Within the United States and other Western countries, new techniques of analysis and new concepts of management are being developed as instrumentalties to deal with the problems created by the new environment.

As is common with organizations that depend heavily upon an elite career service with a strong internal cultural tradition, the Department of State has been slow to adopt the new techniques and adjust to the changing requirements. And the service is probably correct in exercising caution towards many suggested changes. The area of foreign affairs is one of the least amenable to analytic approaches, and many of the management concepts that have been most successful in private corporations are not directly transferable to foreign affairs. On the other hand, there is considerable concern that the State Department's organization and methods of operating, evolved in a more leisurely age, are becoming increasingly inadequate. Foreign affairs are sufficiently important to justify the expenditure of considerable time and effort in attempting to adapt the new techniques and concepts wherever they can make a significant contribution.

PREVIOUS EFFORTS TOWARDS CHANGE

In 1962, William J. Crockett became Deputy Under Secretary of State for Administration and proceeded to develop a program of organizational innovation. He experimented with improved methods for budgeting resource programs, established a center for international systems research to stimulate interest in social science research and systems development, expanded the effort to improve the Department's substantive information systems, built up a career development and counseling staff, attempted to establish a more systematic program of personnel assignments, and began a program to improve the Department's organizational effectiveness through increased attention to interpersonal relationships within the organization.²

Some of these programs were controversial and some were of questionable utility. Others were more successful, but with Crockett's departure, administrative policies became considerably less innovative. A renewed effort, taking into account the lessons learned during Crockett's tenure, is now essential if the Department is to continue the process of change required to improve its capabilities.

ASSIGNING RESPONSIBILITY FOR RECOMMENDING CHANGE

The responsibility for developing and recommending a new policy of organizational innovation should be assigned to one senior official who is not burdened by other operational responsibilities. Since the position of Assistant Secretary of State for Administration is now vacant, this result could be most easily achieved by appointing an Assistant Secretary and transferring to him the day-to-day operational responsibility for administration. The Deputy Under Secretary for Administration would then be free to devote his efforts to developing the new policy of organizational change.

The Deputy Under Secretary would need a small staff including career foreign service officers with substantive experience and "outsiders" with relevant experience and training. In working out the new strategy his staff should enter into a continuing dialogue with the career service and with qualified nongovernmental organizations. In order to make full use of resources outside of the Department, the Deputy Under Secretary should have a budget adequate to enable him to obtain research and consulting services as needed from outside organizations.

The Deputy Under Secretary should also be given the responsibility for monitoring the decision-making "process" within the Department of State. In carrying out this responsibility, he should be concerned with the adequacy of the inputs into the decision-making system, the timeliness of the decisions, the capability of the system to carry out analysis and develop alternatives, and the ability of the systems to relate decisions to more general national policies as determined by the political leadership. In carrying out this responsibility his primary concern should be with the way in which decisions are made and not with the decisions themselves. In recommending organizational change, the Deputy Under Secretary should include measures designed to improve the operation of the decision-making system when he believes that such measures are required.

3 The term "inputs" is meant to include relevant information as well as value judgments as determined by the political process. "Adequacy of inputs" does not mean all relevant inputs. At some point the cost of obtaining additional inputs exceeds their value.
SOME PROBLEMS FOR THE AGENDA

In evolving the new policy, the Deputy Under Secretary will need to deal with a number of existing problem areas. Without attempting an exhaustive listing of these problems, I will outline some salient examples and make some suggestions for new approaches.

I will start with a description of the general approach which I believe should be used to develop a new strategy of organizational change. Following this, I will suggest some approaches to more specific problems. For convenience, I have classified the specific problem areas under the categories of organization, analysis, budgeting, and personnel.
ORGANIZATIONAL GOALS AND PERFORMANCE CRITERIA

The Deputy Under Secretary for Administration should begin a long-range program designed to create more specific operational definitions of the role of the State Department within the Foreign Affairs community. The Department needs a more specific idea of what it should be doing in order to improve its performance. A better role definition would provide a basis for the establishment of criteria for the systematic evaluation of organizational performance. The Department cannot define its role in a vacuum, but it can take the initiative in attempting to establish a greater consensus with the other agencies of the Government, the Congress and the public. An improved consensus with other agencies would lead to more effective performance for the entire foreign affairs community, and an improved consensus with the Congress and the public would help bring State Department performance into line with the expectations held by those upon whom the Department must ultimately rely for support. As a starting point, a comparison could be made between (a) the Department's prescribed role as expressed in current legislation, regulation, and executive orders; (b) perceptions of the State Department role held by the White House, other agencies of the Government, Congress, the public, and by State Department personnel; and (c) its actual role as currently practiced in the field and in Washington.

For example, the Department's role in coordinating foreign affairs has been particularly difficult to define in operational terms. Previous attempts did not work well because the specified allocations of function conflicted with established bureaucratic power realities and, in some cases, with legislative prescriptions. To be effective, a definition of role for the Department must be understood and accepted by the other agencies of government and supported by the Congress and the White House.
ORGANIZATIONAL ANALYSIS

As the Department's role becomes more precisely defined, the Deputy Under Secretary's staff should carry out a series of studies examining the adequacy of the existing organization in the light of its defined role. Recommendations for organizational change could then be based on the more solid underpinning of accepted performance criteria. The lack of consensus on what the State Department should be doing and whether it was performing well or poorly in terms of some established criteria was a major reason for the indifferent success of some of the previous reorganization efforts.
SPECIFIC PROBLEMS

ORGANIZATION

Internal Organizational Problems

It is difficult to separate the Department's organizational problems from the problems of the entire foreign affairs community, or for that matter, from the problems of the entire Federal Government. Certain problems, however, appear salient to most observers. One of these is the excessive workload placed on the senior members of the hierarchy of the State Department. In recent years the Secretary and Under Secretary have been involved in an almost continuous series of crises with little time left over for other activities such as long-range planning, organizational problems and in-depth analysis of fundamental foreign policy issues. Whenever two or more crises occurred simultaneously, the demands on the senior officials became almost overwhelming and problems of somewhat less critical importance had to be given a lower priority. Alternative organizational arrangements are needed to reduce the excessive workload -- perhaps by more decentralization of decision-making combined with more comprehensive policy guidance from senior officials.

Two closely related problems that seem to indicate somewhat conflicting solutions are (a) policy recommendations sometimes fail to receive proper review in the context of global considerations, and (b) the expertise available at the Department's lower levels is sometimes not fully utilized, particularly during crisis periods when time pressures are intense. At present most policy recommendations during non-crisis periods originate in the regional and functional bureaus and, as might be expected, bear a distinct orientation towards the problems of the originating bureaus. Clearance procedures provide some safeguards, but the officials senior to the Assistant Secretaries need stronger staff capabilities to review policy recommendations in a broader context. During crisis periods, on the other hand, policy recommendations may originate at high levels and be implemented without reference to lower-level personnel.
Problem (a) seems to call for an expanded role for senior officials with global responsibility in policy-making while (b) seems to require an expanded role for the lower-level personnel in the regional and functional bureaus. In fact, the two are not necessarily in conflict if they are approached as a single problem in strengthening the two-way learning process between the regional experts and the officials with global responsibility.

A somewhat larger staff for the senior officials with global responsibility could serve as the link with the regional experts and also provide better downward communication from the senior officials to lower-level personnel. The latter is especially important in increasing the awareness of the lower-level personnel of the concerns and constraints that operate at senior decision-making levels.

**Information Systems and Organization**

Many of the Department's organizational problems can be viewed in the context of the current program to improve the Department's substantive information systems. Charting the flow of information is one way of analyzing the organization of the Department and any attempt to change the information systems will have far-reaching consequences for the way the Department functions.

In its earlier stages, the current program is directed primarily toward improving document storage and retrieval. Organizational analysis will become more relevant when attempts are made to further restrict the flow of raw, unprocessed information and to improve information processing prior to its receipt by those who occupy policy positions. The program should also be expanded to include management information systems as a means of improving decisions on budgeting, personnel, and organizational planning.

The designers of an improved information system must also take into account the needs for better capabilities for analysis within the system.
ANALYSIS

Analytic Capabilities

A variety of new techniques of analysis have been developed in recent years for the systematic examination of policy issues. The State Department, for several reasons, has been slow to adopt these techniques to its own operations. Other agencies, particularly Defense and the National Security Council, have been more aggressive in exploiting the new techniques and have used them to enhance their influence in the foreign affairs community.

Techniques of analysis should not be confused with the use of computers and differential equations. Quantitative techniques have an obvious application in certain types of problem solving, but the essential features of analysis are also useful in dealing with problem areas where computers and higher mathematics have no application.

Systems analysis is a way of looking at problems. It emphasizes the explicit statement of assumptions and the viewing of problems in the context of a postulated operational system or model. It involves a systematic examination of the costs and benefits of possible alternative action and gives explicit recognition to elements of uncertainty. In its more highly developed forms it also contributes to the clarification of goals or objectives. 4

The need for improved analysis in no way diminishes the need for individuals in decision-making and policy-making roles with highly developed skills for synthesis. Analysis breaks down problem areas into more intellectually manageable subproblems as a means of acquiring better understanding of the problem areas. Synthesis uses the results of analysis, value judgments, and all relevant information to grasp a problem in all of its aspects and make creative, policy-relevant judgments.

The following figure indicates the interrelationships of these functions:

4For a more complete discussion of the potential contribution of systems analysis to public policy see E. S. Quade, The Systems Approach and Public Policy, The RAND Corporation, P-4053, March 1969.
None of these functions can be performed in isolation from the others and all require judgment and creativity. Value determination is primarily an end product of the domestic political process, and the information collection function is shared between the State Department and other agencies of government. The analysis function is also shared with other agencies, but the coordinating role of the Department would be strengthened if State Department personnel acquired greater sophistication in the use of analytic techniques, particularly in political/strategic and technological areas.

**Political/Strategic Analysis**

It is generally agreed that the rationale for a military establishment of a particular size and structure is always based on fundamental political assumptions concerning the role of the United States in the international arena, and the anticipated future state of the international system. The State Department, however, has played a relatively minor role in the determination of the size and composition of the Defense forces. A strong political/strategic staff -- perhaps headed by an Assistant Secretary -- will be needed if the Department wishes to fulfill its role as principal advisor to the President on foreign affairs in this important area.
Scientific and Technological Analysis

Increasing attention has been given to the problem of how governments, dominated by elected officials and senior career civil servants with relatively little scientific or technological education or experience, can respond intelligently to the many increasingly important problems of public policy with significant scientific and technological components. This problem is particularly acute in foreign affairs, especially when it touches upon questions of national security. Political/scientific judgments affecting our relations with other countries are becoming increasingly important, not only in the vital field of the strategic nuclear balance, but in a variety of other fields such as space exploration, environmental pollution, development of the resources of the sea beds, peaceful uses of atomic energy and telecommunications.

One experienced observer who served for almost five years on the staff of the President's Science Advisory Committee made the following comment on the performance of the State Department in dealing with foreign policy areas with significant scientific or technological components. "Certainly, in the subjects touched on in this work, the Department has not shown the degree of flexibility, of adoption, of appreciation of new situations and new relationships that the scientific age demands. The quality of the Department's advice to recent Presidents on issues with important technological components has not been what it should have been. Moreover, the Department has too often on such issues been the virtual prisoner of the views and desires of the technical agencies of government rather than an independent source of policy."

Skolnikoff recognized the problems faced by the Department in developing greater competence in science and technology but recommended that a stronger effort be made to recruit a scientist with political

---

experience and a personal interest in foreign affairs for the position of Director of the Department's Office of International Scientific and Technological Affairs. He also suggested that the recruitment task might be easier if the incumbent were given the rank of Assistant Secretary. Additional status for the Director of SCI might also assist the process of developing closer working relationships between SCI and the regional and functional bureaus.

To support his plea for strengthening the Department's scientific and technological capability, Skolnikoff emphasized the relevance of scientific achievement to foreign policy interests. "Both space and atomic energy are fields that are peculiarly relevant to a nation's foreign policy interests. They require massive investment of resources, they require advanced scientific and technological competence, they are dramatic and symbolic of the age, and they are related to military capability in fact and even more so in the public's view. In short, they provide an arena for highly visible accomplishments in science and have come to represent a nation's competence and capability far beyond the actual programs themselves. They are obvious instruments of a policy of prestige in an age when surrogate demonstrations of power must serve instead of the real thing."7

In an increasingly technical age, the Department has had to rely more and more on other agencies for scientific and technical guidance. The Department's role as the President's principal foreign policy advisor requires some strengthening of its own scientific and technological capabilities if it is to place the recommendation of the other agencies into their proper international political and economic setting.

Types of Information Required for Analysis

A careful examination of the various types of information utilized by the Department is the first requirement for improving information systems and enhancing the Department's capabilities for analysis. Distinctions are needed between readily quantifiable information (e.g. population, trade, natural resources, and military capabilities) and

7Ibid., p. 211.
information on less concrete but equally important phenomena such as the social and psychological behavior patterns of foreign cultures. A further distinction is needed between information immediately relevant to current problem areas and information of value primarily in a longer-range context.

Quantitative information is, of course, the easiest to process with the new information technology. Knowledge concerning human behavior is more difficult to process, but major efforts are now being made in the academic community to increase our ability to record and communicate this type of information.

Few foreign service officers are familiar with the work being done in the behavioral sciences. This situation reflects their belief that the informed judgment of experienced officers who have lived and worked with the people of a foreign culture is still the best and most reliable source for this type of information.

This may be true, but specialized information that exists only in the mind of a particular officer is lost when that officer is rotated to a new assignment. The Department should continue to scan the work of the behavioral scientists for possible improved methods of recording and transferring information on human behavior.

The pressures of decision-making on senior policy officials tend to screen out information that is not immediately and directly relevant to current problem areas. The organizational challenge is (1) to devise a system that will make it easier for policy officers to obtain background information of all types whenever it is relevant to their immediate concerns, and (2) to familiarize the political leadership with the potentialities of improved information systems.

In addition to the development of improved substantive information systems, there is need for a systematic examination of management information requirements. Budgeting, personnel planning, and organizational planning are all dependent upon accurate and timely information. If the "process" of foreign affairs is to become a subject of greater concern to senior officials, a system will be needed to provide them with better information on how well the Department is functioning.
Planning and Analysis

Decision-making in foreign affairs is frequently criticized for being reactive and controlled by events. Better forward planning, it is alleged, would allow us to exercise better control over events and use them for our own purposes. In practice, however, effective and cooperative working relationships between planners and policy officers have been difficult to achieve.

Within the State Department, planning is usually conceived of as contingency planning and involves hypothetical decision-making under a set of assumed circumstances. This approach works reasonably well in dealing with military contingencies. It may be more difficult in foreign affairs where the number of possible relevant future circumstances must be drawn from a wider range of potentially relevant factors. Contingency planning that attempts to prepackage specific decisions based on specific sets of circumstances is seldom very useful in crisis periods because at least some of the prevailing circumstances are never adequately foreseen. Apart from the many unforeseen contingencies that may develop in the international arena, it is particularly difficult for a State Department policy planner to predict the state of Congressional and public opinion, the interplay of bureaucratic rivalries within the Government, and the political pressures which will be brought to bear on the White House at some future point in time.

On the other hand, planning that limits itself to longer-range considerations and more abstract conceptions becomes further removed from day-to-day policy operations and becomes increasingly irrelevant to harried policy officers.

How can planning be improved and made more relevant to policy? An organizational policy designed to cope with this problem might begin by emphasizing the role of analysis in planning and de-emphasizing the role of synthesis. The function of planning would then shift from an attempt to prepackage decisions to an attempt to develop useful information on a particular problem area, but without the pretense of postulating all relevant considerations that might influence the decision-maker when the time for decision arrives. The planner could then devote his efforts to the preparation of relevant and important future inputs
to the policy-making process. He would not, however, attempt to formulate action recommendations since his analysis would be directed at some, but not all, of the relevant considerations.

Planning can also be conceived as a systematic framework for bringing expert judgment to bear in a somewhat longer time frame than is utilized in day-to-day decision-making. Political/strategic gaming using experts as players and the Delphi techniques for refining expert opinion are two systematic means of using experienced judgment. Planning of this type is most useful as a means of identifying possible future developments that would be of concern to policy makers.

BUDGETING

Resource Program Budgeting

The Department's role as coordinator in foreign affairs would be significantly strengthened if it gained more influence in the budgeting of overseas programs. For a number of reasons the Department has resisted previous efforts to increase its role in the budgeting process. Some modest steps have been taken in recent years, including the Country Analysis and Strategy Papers (CASP) prepared in the joint State/AID Latin American Bureau and the presentation of budget issues to the SIGs and IRGs by the Bureau of the Budget in the fall of 1968. These initial measures have barely started the Executive Branch down the road towards a unified foreign affairs budgeting process based on United States foreign policy goals. For the most part, budget decision-making remains uncoordinated and fragmented among the many agencies with overseas programs. The State Department is probably the only agency with personnel sufficiently experienced in the various

---

9 For an historical analysis of these previous efforts, see Frederick C. Mosher, Program Budgeting in Foreign Affairs: Some Reflections. Memorandum prepared at the request of the Subcommitte on National Security and International Operations of the Committee on Government Operation of the U.S. Senate, 1968.
aspects of foreign operations to coordinate the budget process and to analyze the various programs across budget categories in terms of U.S. goals.

Although the State Department has generally been unenthusiastic about the application of quantitative techniques to foreign affairs, the budgeting process inescapably involves quantification. The organizational challenge is to create a system within which the expert judgment available in the State Department can be more effectively utilized in this quantification process. A new organizational policy should devise procedures that would involve State Department personnel more actively in an integrated budgeting process.

As a first step in improving the Department's capability for resource program analysis, it would be useful to examine the reasons for the failure of the previous proposals. To what extent were these failures a result of weaknesses inherent in the proposals and to what extent were they a result of inadequate concern with the strategy of implementation? Given the climate of attitudes within the State Department, where quantitative analytic techniques have long been viewed with suspicion, a careful implementation strategy will be necessary to explain the goals and rationale of any new program.

State Department Budgeting

Decisions concerning future internal budget requests for the State Department and the overseas missions will be dependent on a variety of issues, many of which are discussed elsewhere in this paper. A new organizational policy may require some increase in funding levels particularly for programs designed to bring about changes in the traditional ways of operating within the Department.

Programs designed to enhance the Department's capabilities in management and analysis will require some additional funding for training, external research, and perhaps some additional funded positions within the Department. These additional programs, if carefully developed, would provide a high yield to the taxpayer by creating a more effective
State Department, but the Department's past reluctance to devote
greater resources to develop capabilities in these areas makes it
both more difficult and more imperative that the case for additional
funds now be well presented.
Personnel Development

In the personnel field, a system of incentives is needed to encourage career officers to acquire a better grasp of the new knowledge and techniques that have become increasingly important in recent years. Exposure to the new techniques should in no way be considered a substitute for the traditional skills of the foreign service officer which remain the central requirement for the conduct of foreign affairs. At present, however, the personnel system provides inadequate career incentives to encourage officers who have the traditional capabilities to broaden their competence to include a familiarity with recent developments in the fields of management and analysis.

Although more rapid promotions could become an important factor in creating new incentive patterns, the prestige afforded to particular types of jobs is even more important for most career officers. The incentive pattern could best be improved by assigning able officers with good records to training programs in management and analysis -- perhaps at universities or "think tanks" -- followed by assignments to high-prestige substantive jobs such as Country Directors or Deputy Chiefs of Mission. When such training assignments, like the present senior training assignments, acquire the reputation of being stepping stones to high-prestige jobs, a new and effective incentive structure will be created. Increased sophistication in the techniques of analysis of economic, political/strategic, and technological problems and a capacity to develop and utilize human and material resources more effectively should be two of the more important qualifications for promotion to senior officer positions.

The Department now provides some training opportunities in analysis. The organizational problem is to create an incentive structure that makes such assignments more attractive in the context of the officer's subsequent career.
Junior Officers and Recruitment

Increased job satisfaction for junior officers is another urgent personnel requirement. Under the traditional system, junior officers have been required to serve an apprenticeship in consular or other routine assignments that in many cases provided only marginal training value. When this system evolved there were few alternative opportunities for a young man interested in the field of foreign affairs. Today, the most able graduates of our universities have a much wider range of opportunities. "Think tanks," foundations, banks, business firms, research fellowships, and the rapidly expanding academic community all offer opportunities that may be more directly related to the abilities and aspirations of the more able graduates than the traditional State Department apprenticeships. At the same time, the gap between the intellectual environment of the universities and the internal cultural environment of the Foreign Service has been widening. Some of the better young men entering the Service from the universities are distressed over the apparent lack of interest in the concepts and techniques they learned in the universities and have left the Service in the hope of finding a more congenial working environment. These trends have been further reinforced by the current tendency of the academic community to redirect its attention from foreign affairs to domestic problems.

The Department's failure to give the Foreign Service examinations for two years has had a seriously adverse effect on the attitudes of college students towards a Foreign Service career. Some students who have pointed towards the Foreign Service in high school and college are understandably bitter and others have prudently decided to direct their efforts towards more reliable employers. The decision to reduce the intake of FSO's and cancel the examinations for two years demonstrated a surprising lack of concern towards the future well-being of our foreign affairs establishment. It has also helped create a top-heavy rank structure in the Foreign Service that will plague administrative officials for some years to come.

In a recent address to Harvard students, McGeorge Bundy said, "It would be hard to demonstrate that the best way to affect foreign
affairs is to enter the Foreign Service."\textsuperscript{10} The fact that this statement came from a man so intimately acquainted with national security affairs and so well experienced in high-level government operations should provide considerable grounds for concern.

Managerial Personnel

The contrast between modern academic training and the State Department is probably greatest in the field of management and administration. The Department has been slow to adopt the current concepts and techniques of management that are taught in the schools of business and public administration and practiced in many successful corporations. The problem of developing managerial talent is even more acute than that of developing able substantive officers. Within the Foreign Service, administrative jobs have less prestige than substantive work since most officers identify administration with routine housekeeping activity. With a few outstanding exceptions, most substantive officers at all levels have avoided administrative assignments. As a result the Department has been unable to develop a corps of senior officers with both substantive and managerial experience adequate to evolve and sustain a dynamic management strategy responsive to the changing conditions of the times. This has become a vicious cycle since the approaches to administration now practiced in the Department discourage many officers from seeking administrative assignments.

This situation could be corrected if able substantive officers were given opportunities to acquire greater familiarity with the new concepts and techniques and then utilized in managerial positions where they would have the satisfaction of seeing their efforts bring about significant results. The activities of the American Foreign Service Association demonstrate that there is a group of "concerned" officers who are seriously interested in developing a more adequate managerial strategy. If these officers were given the opportunity for management training and assignments to managerial positions, and if such training and assignments improved rather than decreased their

chances for later assignments to prestige jobs such as Country Directors and Deputy Chiefs of Mission, their interest in managerial training and assignments would be significantly increased.
CONCLUSION

In conclusion, the Department of State and the Foreign Service are passing through a period that requires significant organizational change. The career service with its elite corps tradition has served the U.S. Government well by providing a steady supply of experienced and dedicated officers to man the foreign affairs establishment, but the career system has remained relatively isolated from developments in other areas that are becoming increasingly relevant to foreign affairs.

The growing complexity of foreign affairs has increased the requirement for systematic analysis of foreign policy issues, particularly those with important political/strategic and technological components. The Department has need for a stronger analytic capability.

On a somewhat different level, the need for an improved capability for analysis raises the question of how the required capability could be developed and how it could be integrated into the decision-making system. These questions indicate the need for an improved managerial/organizational capability to bring about the required changes in the Department's operations and in the operation of its overseas missions.

In both of these areas, considerable progress has been made since World War II, and the Department and the Foreign Service could benefit from greater contact with the organizations (academic community, "think-tanks," and management consultants) where the new techniques and concepts have been developed.

The need for changes does not imply that the traditional qualifications for foreign affairs decision-making are no longer valid, nor does it imply that the traditional tools of diplomacy are no longer needed. The new capabilities are required to supplement, not replace, the traditional skills and qualifications. Organizational change, if it is not to do more harm than good, should be brought about with the full involvement of people experienced in the operations of the foreign affairs community.

At the same time, little can be accomplished unless the effort for change reaches a "critical mass." Piecemeal efforts for change are
usually ineffectual. The system manages to preserve the status quo by making compensating adjustments elsewhere in its operations.

An effective strategy for organizational change will therefore require (1) use of outside resources; (2) involvement of the career service; (3) support at senior levels; (4) adequate resources to carry out a coordinated program at a level above the "critical mass."
ASSIGNING RESPONSIBILITIES FOR ORGANIZATIONAL CHANGE

1. Appoint an Assistant Secretary for Administration and transfer to him the responsibility for the day-to-day administrative operations of the State Department.

2. Give the Deputy Under Secretary for Administration the responsibility for developing and recommending a strategy of organizational change.

3. Make the Office of Deputy Under Secretary for Administration the focal point for (1) greater involvement of the career service in developing a strategy of organizational change, and (2) increased contact with outside resources (e.g., academic community, consulting firms, and "think tanks").

4. Assign to the Deputy Under Secretary the responsibility for the continuous monitoring of the "process" of decision-making within the State Department. In carrying out this responsibility he should be primarily concerned with the adequacy of the inputs into the decision system, its capacity for timely action, its ability to relate to national values as determined by political leadership, and its capability for developing and examining alternative courses of action.

PROVIDING RESOURCES FOR CHANGE

5. Provide the Deputy Under Secretary with a budget for outside research and consulting services and a small staff including both career foreign service officers and "outsiders" with relevant experience.

DEVELOPING A STRATEGY FOR ORGANIZATIONAL CHANGE -- GENERAL APPROACH

6. Attempt to establish a better inter-governmental consensus on the role of State Department.

7. Attempt to establish more specific performance criteria.

8. Evaluate the Department's organization in terms of its capability to fulfill its designated role and meet the established performance criteria.
9. Recommend changes including an implementation strategy as required to improve performance.

DEVELOPING A STRATEGY OF ORGANIZATIONAL CHANGE -- SOME MORE SPECIFIC SUGGESTIONS

A. Senior Leadership

10. Search for opportunities to decentralize decision-making at upper levels of the State Department hierarchy accompanied by a strengthening of the flow of policy guidance downward from senior officials.

11. Expand staff support for senior officials with global responsibility while increasing opportunities for mutual learning between the expanded staff and the experts in the regional and functional bureaus. Strengthen the downward communication of the concerns and constraints that operate at senior levels.

B. Analytical Capability

12. Develop stronger capabilities for analysis, particularly the analysis of issues with significant political/strategic or technological components, by more focused recruitment, expanded training opportunities, and revision of the incentive system.

13. Establish additional incentives by giving more weight to sophistication in analysis when promoting officers to senior officer grade and when assigning them to "program direction" positions.

C. Foreign Affairs Budgeting

14. Involve State Department personnel more deeply in an integrated foreign affairs budgeting process.

D. Information Systems

15. Analyze information requirements into more specific categories and relate efforts to improve the information systems more directly to a strategy for organizational change.

16. Expand the program of improving substantive information systems to include management information systems.
E. Planning

17. Increase the emphasis on analysis and reduce the emphasis on contingency planning.

18. Explore uses of political/strategic gaming and Delphi techniques in planning.

F. Management

19. Develop stronger managerial capabilities through expanded training, more focused recruitment, and increased contact with professional developments in the field of management.

20. Increase the emphasis on managerial experience and capability in promoting officers to senior grades and in assigning them to "program direction" positions.

G. Personnel Resources

21. Increase work satisfaction of junior officers.

22. Maintain a steady level of recruitment of junior officers.
