THE PILOT TRAINING STUDY:
A User's Guide to the PILOT
Computer Model
Lois Littleton

This research is supported by the United States Air Force under Project RAND—Contract No. F44620-67-C-0045—monitored by the Directorate of Operational Requirements and Development Plans, Deputy Chief of Staff, Research and Development, Hq USAF. Views or conclusions contained in this study should not be interpreted as representing the official opinion or policy of the United States Air Force.

DISTRIBUTION STATEMENT
This document has been approved for public release and sale; its distribution is unlimited.
PREFACE

In April 1967, the Office of the Assistant Secretary of Defense (Manpower and Reserve Affairs) formed a Pilot Advisory Committee to study "Pilots as a National Resource." The Committee consisted of the Assistant Secretary and a representative of each of the three Services. Staff members from Rand were invited to attend the early meetings of the Committee. The outgrowth was that the Air Force member requested Rand to accept responsibility for examining the Air Force pilot training process. The objective of the Rand Pilot Training Study was to develop a series of computer models for use in estimating the resources required to produce pilots and the costs of training them. Further, the models were to be designed for sensitivity analyses and long-range planning.

For the convenience of readers whose interests may not extend to all aspects of the pilot training process, the results of the study are presented in eight volumes, as follows:

Volume

<table>
<thead>
<tr>
<th>Volume</th>
<th>Number</th>
<th>Title</th>
<th>Author</th>
</tr>
</thead>
</table>
This Memorandum, Volume II of the series, describes the computer program for a pilot flow simulator called the PILOT Model. As explained in Volume I, the PILOT model is a representation of the flow of pilots through the training process—precommissioning, and undergraduate and advanced pilot training. The model also simulates the movement of pilots to and from their subsequent assignments, that is, the flow of pilots into and out of desk jobs, flying jobs, and the advanced training schools to which they are sent for the additional instruction (cross-training) required to qualify them to fly a different type and model of aircraft. It is suggested, therefore, that the user read Volume I for an understanding of the total process of training USAF pilots.

The PILOT model may be used to estimate the effects of alternative policies on these pilot flows and the effect of these flows, in turn, upon training rates. The PILOT model may also be used in combination with (used to provide inputs to) the models representing precommissioning training and undergraduate and advanced pilot training activities. This coupling of the individual pilot training models provides a simulation of the entire Air Force training process that may be used to estimate the overall impact upon costs of pilot training alternatives.
SUMMARY

This Memorandum is a manual or guide for users of the PILOT model. Section I is an introductory explanation of the purposes of the model. Sections II and III describe the data inputs and program outputs. They provide a listing of a sample input deck and a sample printout of each of the six sets of output data. Section IV is a detailed explanation, illustrated by flowcharts, of the routines involved in entering the data inputs, computing requirements for new pilots and for cross-training of pilots, searching for means by which to fill the requirements, and computing commission training entrants and graduates.

The PILOT model program was written in FORTRAN IV. It uses 116K bytes of core on a 360/65 computer. As indicated above, all input data is read from cards and the output is printed.

The final section of the Memorandum presents a symbolic listing of the FORTRAN IV computer program.

I. INTRODUCTION

The purpose of the PILOT model is to simulate the flow of pilots through formal training and into the jobs in which they are required.

Air Force formal training for the production of pilots consists of:

1. Air Force Academy (AFA), Reserve Officer Training Corps (ROTC) and Officer Training School (OTS) programs. The Precommissioning Training programs are treated as a part of the pilot training process because only commissioned officers are admitted to pilot training. (The PILOT model computer program refers to the Precommissioning Training programs as "commission training.”)

2. Undergraduate Pilot Training (UPT). After receiving his commission, the pilot candidate is given flying training at one of ten UPT bases. It is through successful completion of this program that he earns his pilot’s wings.

3. Survival School (SS). This school provides instruction in basic techniques of survival in physically- or politically-hostile environments. This training is mandatory for all flight crews.

4. Advanced Pilot Training (APT). This training qualifies the pilot to fly a specific type and model of operational aircraft. It is conducted by organizations referred to, variously, as Combat Crew Training Schools (CCTS), Replacement Training Units (RTU) or Transport Training Units (TTU), or by the general designation of Advanced Pilot Training. (In the PILOT model computer program, all advanced pilot training is referred to simply as CCTS.)

Given the number of trained pilots required over a specified time period and a statement of the policy concerning flow of pilots between desk and flying assignments, the computer program determines at what times and in what numbers pilots must enter and leave the various training courses in order to meet the requirement.

The program can process requirements for a maximum of 20 years, 80 aircraft systems and 3 categories of pilots.

\*Pilots are assumed to be required in both flying and nonflying jobs.
II. PROGRAM INPUT DECK

In this section, the format for each card type in the input deck is illustrated and the names of the data inputs are defined.

The input deck setup is as follows:

1. Run title card.
2. One type 1 card.
3. One type 2 card.
4. One type 4 card for each weapon system.
5. One type 6 card followed by a set of type 5 cards, for each year starting with the base year. (Within each type 5 set, there is a card for each weapon system and pilot type for which information exists.)
6. One type 7 card for each year, beginning with the base year.
7. One type 8 card for each year, beginning with the year following the base year.

A sample input deck is illustrated in Fig. 1.

Run title card. The run title can appear anywhere on this card. The card is read in a 20A4 format. The first card in the input deck listed in Fig. 1 is a run title card.

Type 1 card. The type 1 card is the run control card. It contains the following data:

<table>
<thead>
<tr>
<th>Data Name</th>
<th>Position on Card</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;1&quot;</td>
<td>Col. 1</td>
<td>I1</td>
</tr>
<tr>
<td>NBYR</td>
<td>Cols. 5-6</td>
<td>I2</td>
</tr>
<tr>
<td>NLYR</td>
<td>Col. 11-12</td>
<td>I2</td>
</tr>
<tr>
<td>NWPN</td>
<td>Col. 17-18</td>
<td>I2</td>
</tr>
</tbody>
</table>

NBYR is the base year, * NLYR is the last year * used in the run, and NWPN is the number of the last weapon system used in the run.

The program can handle a maximum of 20 years, and 80 weapon systems. Hence,

\[ NLYR - NBYR \leq 19 \text{ and } NWPN \leq 80. \]

The 19 years cannot straddle the century.

---

*The last two digits of the year are entered; for example, if the base year is 1968, NBYR should be 68.

</tbody>
</table>

T1 is the travel and leave time in days after CCTS.

T2 is the travel and leave time in days after survival school.

T3 is the travel and leave time in days after UPT.

T4 is the travel and leave time in days after commission training.

S41 is the AF Academy length in days (= 1460 days).

S42 is ROTC length in days (= 1460 days).

S43 is OTS length in days (= 1460 days).

A64 is the time in days required to expand UPT.

A3 is the number of desk job pilots in the base year.

A65 is the capacity of OTS.

NA66 is 1 if OTS expansion is allowed or 0 if OTS expansion is not allowed.

A67 is the time in days required to expand OTS.

Type 4 card. Each type 4 card pertains to a specific weapon system and contains the following data.

<table>
<thead>
<tr>
<th>Data Name</th>
<th>Position on Card</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;4&quot;</td>
<td>Col. 1</td>
<td>I1</td>
</tr>
<tr>
<td>NWP</td>

<tr>
<td>NA12</td>
<td>Cols. 33-36</td>
<td>I4</td>
</tr>
<tr>
<td>IC</td>
<td>Cols. 80</td>
<td>I1</td>
</tr>
</tbody>
</table>
NWP is the weapon system number.
NA7 is the aircraft type of the weapon system: The type can be either bomber/cargo (NA7 = 1) or fighter (NA7 = 0).

For cross-training pilots in this weapon system:
NA10 is the preference index for pilots from similar aircraft.
NA11 is the preference index for pilots from dissimilar aircraft.
NA12 is the preference index for pilots in desk jobs.
IC = 9 if card is the last type 4 card; otherwise, Col. 80 is blank.

Type 6 card. The type 6 card contains the following data:

<table>
<thead>
<tr>
<th>Data Name</th>
<th>Position on Card</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;6&quot;</td>
<td>Col. 1</td>
<td>I1</td>
</tr>
<tr>
<td>A4</td>
<td>Cols. 2-5</td>
<td>F4.3</td>
</tr>
<tr>
<td>A6</td>
<td>Cols. 11-15</td>
<td>F5.4</td>
</tr>
<tr>
<td>A9</td>
<td>Cols. 21-26</td>

<td>Cols. 66-70</td>
<td>F5.0</td>
</tr>
<tr>
<td>NYR</td>
<td>Cols. 79-80</td>
<td>I2</td>
</tr>
</tbody>
</table>

A4 is the pilot loss rate for pilots in desk jobs in year NYR, where the pilot loss rate describes all losses from the pilot inventory, including retirement, resignation, death, promotion, disability, etc.
A6 is the attrition rate for CCTS in year NYR.
A9 is the number of pilots in the UPT pipeline in year NYR.
A62 is the UPT capacity in year NYR.
NA63 = 1 if UPT expansion is allowed in year NYR;
= 0 if UPT expansion is not allowed in year NYR.
A20 is the number of pilots leaving UPT in year NYR who have received pilot training but are not members of the Air Force.
S2 is survival school length in days in year NYR.

*The index can be 1, 2, or 3 if the source is the first, second, or third choice, respectively. Each of the three sources must have a unique preference assigned to it; i.e., no two sources can have the same preference index.
S3 is UPT course length in days in year NYR. (The sum of S3 is in the year after the base year and T4, the travel and leave time after commission training, must be less than, or equal to, 547.5 days: \((S3(l) + T4 \leq 547.5)\).

**Type 5 card.** The type 5 card contains the following information:

<table>
<thead>
<tr>
<th>Data Name</th>
<th>Position on Card</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;5&quot;</td>
<td>Col. 1</td>
<td>I1</td>

<tr>
<td>S1**</td>
<td>Cols. 71-74</td>
<td>F4.0</td>
</tr>
<tr>
<td>IC</td>
<td>Col. 80</td>
<td>I1</td>
</tr>
</tbody>
</table>

NYR is the year. NWP is the weapon system. NTP is the pilot type.

For year NYR, weapon system NWP, and pilot type NTP:

- A1 is the required pilot inventory.
- A2 is the fraction of A1 desired through UPT.
- A5 is the pilot loss rate for pilots in cockpits.
- A5A is the rate at which pilots leave aircraft system NWP to transfer into desk jobs.
- S1 is the length in days of CCTS.

CCTS can be described as either a long or a short course. For any year and weapon system type 1 pilots will take the short course if they are being cross-trained from a similar aircraft system, and type 2 and 3 pilots will take the long course. All pilots that are cross-trained from desk jobs or dissimilar aircraft systems will take the long course.

---

*Short course. This data should appear only on a card on which ntp = 1.*

**Long course. This data should appear only on a card on which NTP = 1.*
IC = 9 on each type 3 card which is the last card in a type 5 set; otherwise, it is blank.

Type 7 card. The type 7 card contains data pertaining to rates of attrition during commission training and to numbers of UPT entrants.

<table>

For year NYR:

A21 is the attrition rate in UPT of AF Academy graduates.
A22 is the attrition rate in UPT of ROTC graduates.
A23 is the attrition rate in UPT of OTS graduates.
A24 is the attrition rate in UPT of rated officers.
A25 is the attrition rate in UPT of nonrated officers.
A26 is the attrition rate in UPT of others.
IC = 9 on the last type B card.
III. PROGRAM OUTPUT

The program prints six sets of information. A description and illustration of each set follow.

The first page of output contains simply the run title, e.g., "Variation No. 8 on Base Case—8% pilot loss rate, 8% rotation into desks."

Under the title "Pilot Model Output - Main Information," the following information is printed for each year, weapon system, and pilot type (Fig. 2):

1. Required pilot inventory, which is an input value.
2. Number of pilots lost from the cockpit inventory at the end of the year.
3. Number of pilots leaving the weapon system for desk jobs at the end of the year.
5. Number of pilots desired through UPT.
6. Number of pilots obtained through UPT.
7. Number of pilots desired through cross-training.
8. Number of pilots obtained through cross-training.
9. Number of pilots upgraded.

Under the title "Pilot Output - Pilots Entering CCTS," for each weapon system the following information about CCTS is printed for all years (Fig. 3):

1. Number of pilots entering CCTS from UPT, from similar A/C, from dissimilar A/C, and from desk jobs.
2. Total entrants into CCTS.
3. Total graduates from CCTS.

Under the title "Inventory of Desk Job Pilots at Year's End," the inventory of pilots in desk jobs at the end of the year is printed for each year (Fig. 4).

**Fig. 6 - Sample Program Output—Inventory of Desk Job Pilots at Year's End**
Under the title "Pilot Model Output - Commission Training," the following information about commission training is printed for each year (see Fig. 5):

1. Number of AF Academy entrants.
2. Number of AF Academy graduates.
3. Number of ROTC entrants.
4. Number of ROTC graduates.
5. Number of OTS entrants.
6. Number of OTS graduates.

Finally, under the title "Pilot Model Output - Entrants into UPT from Six Sources," the following information about UPT is printed for each year (see Fig. 6):

1. Number of entrants into UPT by source: AF Academy, ROTC and OTS graduates, rated officers on active duty, nonrated officers on active duty, and "Others."*
2. Total number of UPT entrants.
3. Total number of UPT graduates.
4. A "Yes" or "No" answer as to whether UPT was expanded.

* "Others" includes students from Air National Guard, Marines and MAP who are given UPT training but who do not add to the pilot strength of the Air Force. UPT entrants also include a few Military and Naval Academy graduates.

**Fig. 6 - Sample Program Output-Entrainents into UPT from Six Sources**
IV. PROGRAM DESCRIPTION

PROGRAM STRUCTURE

The program for the PILOT model is composed of a main routine (PILOT) and the following nine subroutines: READ2, READ4, READ5, READ7, READ8, CROSS, TTIME, OUTP, and OUTPUT.

The first five subroutines are used to read type 2, 4, 5, 7, and 8 cards, respectively. Subroutine CROSS determines the number of pilots to be taken from a given source for CCTS cross-training. Given the end year of UPT, subroutine TTIME computes the beginning year of UPT, the end year of commission training, and the beginning years of the AF Academy, ROTC and OTS training. Subroutine OUTPUT prints the information entitled "Pilot Model Output - Pilots Entering CCTS." Subroutine OUTP prints the information entitled "Pilot Model Output - Commission Training" and "Pilot Model Output - Entrants into UPT from Six Sources."

PROGRAM FLOW

The Pilot program can be divided into four logical sections of execution:

1. Data input and initialization of variables.
2. Computation of pilot requirements for a given year, all weapon systems and pilot types.
3. An attempt to fill requirements for new pilots and for cross-training for a given year, all weapon systems, and pilot types.
4. Computation of commission training entrants and graduates for all years.

Section 1 is executed initially. Then, for each year, Sections 2 and 3 are executed consecutively. Section 4 is executed last.

A detailed description of each of the above four sections follows. All variable names beginning with an "A," "T" or "S" are input quantities and were defined in Section II of the Memorandum. All of the input data that represent a length of time are initially converted from days to fractions of a year. The subscripts used in the program are
N, W, and T where W represents a weapon system and T represents a pilot type. N represents a year relative to the base year 0; hence, if the real base year is 1968, the year 1970 would be represented by N = 2.

Section 1: Data Input

The data input deck has been described in Section II of this memorandum. As this data deck is read, the program will print error messages and then terminate execution if the following error conditions are encountered:

If the first card in the input deck does not contain a "I" in column 1, the following message is printed: "I" CARD IS MISSING FROM INPUT DECK. If the second card in the deck does not contain a "2" in column 1, this message is printed: "2" CARD IS MISSING FROM INPUT DECK.

After the type 2 card, the type 4 cards are read. If the program encounters a card that does not contain a "4" in column 1, this message is printed: CARD READ IS NOT A TYPE 4 CARD - CHECK FOR A MISPLACED CARD IN THE TYPE 4 SECTION. This error statement will also be printed if a "9" does not appear in column 80 of the last type 4 card. The "9" signals the end of the set of cards. If the "9" does not appear, the program will read the next card, a type 6 card, "thinking" that it should be a type 4 card.

If a weapon system number on a type 4 card exceeds the number 80, the following message is printed: WEAPON SYSTEM NUMBER ON TYPE 4 CARD EXCEEDS ALLOWABLE NUMBER.

After the type 4 cards are read, the program expects to read one type 6 card followed by a set of type 5 cards for each consecutive year starting with the base year. If a card without a "6" in column 1 is encountered when the program expects to read a type 6 card, the following message is printed: A TYPE 6 CARD IS MISSING. If a type 6 card does not contain the right consecutive year, this message is printed: TYPE 6 CARD DOES NOT CONTAIN THE RIGHT YEAR.

Having read a type 6 card for a particular year, the program reads type 5 cards for that year until a "9" is encountered in column 80 of a
card. The "9" signals the last type 5 card in this set. If a card does not contain a "5" in column 1, this message is printed: CARD READ IS NOT A TYPE 5 CARD - CHECK FOR A MISPLACED CARD IN A TYPE 5 SECTION.

If a type 5 card does not contain the same year as the preceding type 6 card, the following message is printed: A TYPE 5 CARD DOES NOT CONTAIN THE RIGHT YEAR. If the weapon system number is greater than 80 or a pilot type number is greater than 3 on a type 5 card, the respective messages are printed: WEAPON SYSTEM NO. ON TYPE 5 CARD EXCEEDS ALLOWABLE NUMBER; or, PILOT TYPE NO. ON A TYPE 5 CARD EXCEEDS ALLOWABLE NUMBER.

After a type 6 card and all type 5 cards for the final year have been read, the program reads a type 7 card for each consecutive year beginning with the base year. A "9" in column 60 signals the last type 7 card. Then, a type 8 card for each consecutive year is read beginning with the year after the base year. Again, a "9" in column 80 signals the last type 8 card. If the type number is not correct on either a type 7 or 8 card, the following message is printed:

CARD READ IS NOT A \{7\} CARD - CHECK FOR A MISPLACED CARD IN THE TYPE \{7\} SECTION.

If either type card does not contain the right consecutive year, this message is printed:

A TYPE \{7\} CARD DOES NOT CONTAIN THE RIGHT YEAR.

**Data Initialization.** Except for the variable $A_2$, data initialization is a straightforward setting to zero of all variables. $A_{2,N,W,T}$ is the fraction of the pilot requirement for year $N$, weapon system $W$, and pilot type $T$ that is desired through UPT. A value of $A_2$ for the first year is computed by the program in order that all pilots in the UPT pipeline in the base year are put into the system. This computed $A_2$ will then be used in the first year for the weapon systems and pilot types for which the required pilots would graduate from UPT in the base year. The input $A_2$ is used for the remaining requirements in the first year.
The data used in computing $A_2$ are $A_{0,\text{W},\text{T}}$, $A_{1,\text{W},\text{T}}$, $A_{5,\text{W},\text{T}}$, and $A_{9,\text{W},\text{T}}$ for all weapon systems $\text{W}$ and pilot types $\text{T}$ in year 1 for which the required pilots would graduate from UPT in the base year 0. An indicator $\text{INDC}(\text{NW},\text{NT})$ is set to "2" for each such weapon system $\text{NW}$ and pilot type $\text{NT}$. At this time, the indicator $\text{INDC}(\text{NW},\text{NT})$ is set to "1" if the required pilots in year 1 are found to have graduated from UPT before the base year.

The flow chart in Fig. 7 illustrates the computation of $A_2$.

Section 2: Computation of Pilot Requirements

The procedure for computing pilot requirements is described for one year $\text{N}$, all weapon systems and pilot types. The procedure is as follows:

1. For one weapon system, all pilot types, find the difference $P_1$ between this year's required pilot inventory and the pilot inventory $LP_{\text{N}}$ at the end of last year (see Fig. 8).

2. Try to fill the pilot requirement for a type 1 pilot $(P_{1,\text{N},\text{W},\text{T}})$ with upgraded type 2 and type 3 pilots from the inventory $(LP_2$ and $LP_3$) of year $\text{N-1}$. If upgraded type 2 and type 3 pilots are used from year $\text{N-1}$, an equal number of pilots are added to the pilot requirement for type 2 and type 3 pilots in year $\text{N}$. Having done this, try in the same manner to fill the pilot requirement for a type 2 pilot $P_{1,\text{N},\text{W},\text{T}}$ with upgraded type 3 pilots from year $\text{N-1}$. $UP_2$ and $UP_3$ collect the upgraded type 2 and type 3 pilots, respectively (see Fig. 9).

3. After the pilot requirements $P_{1,\text{N},\text{W},\text{T}}$ have been computed and adjusted for one weapon system, all pilot types, the program determines the number of desired CCTS graduates $P_{2,\text{N},\text{W},\text{T}}$ and $P_{3,\text{N},\text{W},\text{T}}$ from each of two sources, new people and cross-training, respectively, to fill the pilot requirements (see Fig. 10). If the year $\text{N}$ is the first year and the required pilots $P_{1,\text{N},\text{W},\text{T}}$ would have graduated from UPT before the base year ($\text{INDC}(\text{NW},\text{NT}) = 1$), $P_{2,\text{N},\text{W},\text{T}}$ and $P_{3,\text{N},\text{W},\text{T}}$ are set to 0. These pilots are already in the system.

4. If $P_{1,\text{N},\text{W},\text{T}}$ is negative, a surplus of pilots exists and will be assigned either to a bomber/cargo surplus pool $P_4$ or to a fighter surplus pool $P_5$, depending on the aircraft type of weapon system $\text{W}$.
Fig. 7—Flowchart of the computation of $A_2$ for year 1
Fig. 8—Flowchart of the computation of pilot requirements:

- Compute PI
- $T = 1$

Pilot inventory at the end of year $N-1$, weapon system $W$, Pilot type $T$:

\[ LP_T = A1_{N-1,W,T} \cdot (1 - A5_{N-1,W,T} - ASA_{N-1,W,T}) \]

Pilot requirement for year $N$, weapon system $W$, pilot type $T$:

\[ P1_{N,W,T} = A1_{N,W,T} - LP_T \]

\[ T = T + 1 \]

Upgrade routine

\[ T > 3 \]
Fig. 9—Flowchart of the process of filling pilot requirements with upgraded pilots
Fig. 10—Flowchart of the computation of the desired graduates from each of two sources, new people and cross-training
When these calculations are completed for the three pilot types, the program returns to "1" and executes "1", "2", and "3" for the next weapon system. After the last weapon system has been processed, execution proceeds to Section 3.

Section 3: Filling Requirements for New Pilots and Pilots for Cross-Training

In this section of the program an attempt is made to fill the requirements for new pilots, $P_{2N,WT}$, and the requirements for cross-trained pilots, $P_{3N,WT}$, for one year $N$, all weapon systems and pilot types.

A check is made on each $P_{2N,WT}$ to see if it is positive or negative. If it is negative, the program proceeds to make the same check on $P_{3N,WT}$. If $P_{2N,WT}$ is positive, an indicator IND is set to signal that a new pilot requirement is being processed. Now, given the year $N$ in which new pilots are required, the program calculates the years in which they would have had to graduate from CCTS, enter CCS, leave survival school, graduate from UPT, and graduate from commission training in order to fill the requirement in year $N$. If the end year of commission training is the base year or later, there is sufficient time to train the required new people. An indicator IPIPE is set to 0 to indicate sufficient training time. If there is not enough time to train new people, IPIPE is set to 1.

Under certain conditions the program will branch from a part not yet described into the calculation of training program years. This branch occurs when a cross-training requirement cannot be filled through cross-training. The program will try to fill the deficit with new pilots. If this branch is executed, IND = 1 to indicate that a cross-training request is being processed and $P_{3N,WT}$ contains the deficit.

The preceding discussion is illustrated in Fig. 11.

Suppose that there is sufficient time to train new pilots for either a new pilot requirement $P_{2N,WT}$ for year $N$ or the part of the cross-training requirement $P_{3N,WT}$ for year $N$ that cannot be filled from cross-training sources. If the attrition rate in CCTS (A6) is

\* See p. 30.
Fig. 11—Flowchart of the computation of the beginning and end years of UPT, survival school, and CCTS
taken into consideration, enough pilots are scheduled to enter CCTS in year 14 to produce the required number of graduates. The pilots scheduled to enter CCTS in year 14 are then scheduled to graduate from UPT in year 13. At this point, a check is made to determine whether the UPT capacity in year 13 has been exceeded. This capacity check is described later in this section.

If there is insufficient time to train new people to fill a requirement for year N, the UPT pipeline (A9) in year 13 is used as described below.

The number of pilots required to enter CCTS in year 14 is compared with the number in the pipeline. If the requirement is less than the pipeline, the requirement is taken from the pipeline and scheduled into CCTS in year 14. A UPT capacity check is not necessary because the pipeline is being used. If the requirement exceeds the pipeline, the total pipeline is scheduled to enter CCTS in year 14 and the deficit is handled either as an additional cross-training requirement if the original request was one for new people or as a call for reserves if the new people were needed to fill a deficient cross-training requirement. If a reserve call-up is necessary, the following message is printed:

RESERVES HAVE BEEN CALLED. FOR YEAR--; WP. SYS.--, PILOT TYPE--; CROSS-TRAINING REQUIREMENT CANNOT BE FILLED THROUGH CROSS-TRAINING. THERE IS NOT ENOUGH TIME TO TRAIN NEW PEOPLE AND THERE ARE NOT ENOUGH PIPELINE PILOTS TO FILL THE DEFICIT.

The foregoing discussion is illustrated in Fig. 12.

The UPT capacity check as mentioned earlier is accomplished in the following manner and illustrated in Fig. 13: The value of the indicator ICAP can be 0, 1, or 2. If ICAP for year 13 is 1, the capacity of UPT in year 13 has already been exceeded, but UPT expansion is allowed (A63 = 1) and there is enough time to expand. Hence, UPT in year 13 can handle those people assigned to it. If ICAP for year 13 is 0, the capacity in year 13 has not yet been exceeded. But the people added to the total UPT graduates in year 13, since the last UPT
Fig. 12—Flowchart of the process of filling requirements for new people and cross-training.
Fig. 13—Flowchart of the process of checking UPT capacity
capacity check, may have forced the total beyond capacity. The total, therefore, is compared to the capacity. If capacity has not been exceeded and expansion is allowed and there is enough time to expand, ICAP is set to 1 to indicate that UPT can handle all pilot candidates assigned to it in year 13. If the capacity is exceeded and expansion either is not allowed or cannot be accomplished in the time available, ICAP is set to 2 to indicate that no more trainees can be assigned to UPT in year 13. Those that cannot be handled by UPT are deleted from the number of CCTS entrants in year 14, and become either an additional cross-training requirement or a reserve call-up, depending on the value of IND. If a reserve call-up is necessary, the following message is printed:

RESERVES HAVE BEEN CALLED. FOR YEAR--, WP. SYS.--, PILOT TYPE--, CROSS-TRAINING REQUIREMENT CANNOT BE FILLED THROUGH CROSS-TRAINING. THERE IS ENOUGH TIME TO TRAIN NEW PEOPLE, BUT UPT CAPACITY HAS BEEN EXCEEDED AND EITHER EXPANSION IS NOT ALLOWED, OR THERE IS NOT ENOUGH TIME TO EXPAND UPT.

Having processed a new pilot requirement for one weapon system and pilot type, the program attempts to fill the cross-training requirement $P_{3N,W,T}$ for that same weapon system and pilot type. If $P_{3N,W,T}$ is less than zero, the program continues and updates the desk job inventory for year $N$.

There are three sources from which people can be taken for CCTS cross-training: similar aircraft, dissimilar aircraft, and desk jobs. Each source has been assigned a preference by weapon system. For the description that follows, assume that the similar aircraft source is first preferred ($A_{LO,W} = 1$), the dissimilar aircraft source is second preferred ($A_{1W} = 2$), and the desk job source is third preferred ($A_{2W} = 3$).

The program tries to fill $P3$ from the first preferred source, similar aircraft. It computes the year 14 in which people would enter CCTS. The number of people required to enter CCTS in year 14 in order to fill the requirement in year $N$ is then compared either with the bomber/cargo surplus pool $P4$, if the weapon system aircraft type is
bomber/cargo \((A7_W = 1)\), or with the fighter surplus pool \(P5\), if the
weapon system aircraft type is fighter \((A7_W = 0)\). If the chosen pool
is larger than the requirement, the required number of people are taken
from the pool and scheduled to enter CCTS in year \(I4\). Because this
fills the cross-training requirement in year \(N\) for this weapon system
and pilot type, the program then proceeds to update the desk inventory
for year \(N\).

If the chosen source (in this illustration, similar aircraft) is
not large enough, the entire pool is scheduled to enter CCTS in year
\(I4\), and an attempt is made to fill the deficit from the second preferred
source, dissimilar aircraft.

The procedure for using the dissimilar aircraft source is the same
as that for the similar aircraft source except for the choice of pool
to be used. If the weapon system aircraft type is bomber/cargo, the
fighter surplus pool will be used; if the weapon system aircraft type
is fighter, the bomber/cargo surplus pool will be used.

If the cross-training requirement cannot be completely filled by
the second preferred source, the program tries the third source, that
is, desk jobs. Again, the procedure for using the desk job source is
the same as for the other two sources except that there is only one
pool to be used, namely, the desk job inventory \(P6\) from year \(N-1\).

If the total requirement \(P3\) cannot be filled from these three
sources of APT-trained pilots, UPT is called upon to provide an inflow
to APT to meet the shortage. If UPT cannot provide the full number
needed or cannot provide them in sufficient time to eliminate the short-
age, the reserves are called upon to fill whatever deficit remains.
If a reserve call-up is necessary, the following message is printed:

RESERVES HAVE BEEN CALLED. FOR YEAR-- , WP. SYS.-- , PILOT
TYPE--, CROSS-TRAINING REQUIREMENT (WHICH INCLUDES PART OF
THE NEW PEOPLE REQUIREMENT) CANNOT BE FILLED.

It should be noted that a type 1 pilot will take the short course
in CCTS if cross-trained from similar aircraft and the long course if
cross-trained from either of the remaining sources. A type 2 or type 3
pilot will take the long course in CCTS regardless of the source from
which he is taken.
Figures 14, 15, and 16 illustrate the cross-training of pilots from the similar aircraft source, dissimilar aircraft source, and the desk job source, respectively.

After a new pilot requirement $P_2$ and a cross-training requirement $P_3$ for one weapon system $W$ and pilot type $T$ in year $N$ have been processed, the desk job inventory $P_6$ for year $N$ is updated by the following:

1. Transfer into desk jobs from the pilot inventory in year $N-1$ for weapon system $W$ and pilot type $T$.
2. Attrition from CCTS into desk jobs in year $N$ for weapon system $W$ and pilot type $T$.
3. Subtraction of the number of people taken from the desk job inventory in year $N-1$ to be cross-trained in CCTS for weapon system $W$ and pilot type $T$.

After all $P_2$ and $P_3$ requirements for year $N$ have been processed, the desk job inventory for that year reaches its final total by:

1. Addition of the pilots in the bomber/cargo and fighter surplus pools in the year $N$ that have not been used.
2. Addition of the pilots in the desk job inventory at the beginning of year $N-1$.
3. Subtraction of pilot losses from desk jobs in year $N-1$.

If the final total is negative, an error message stating this fact is printed and program execution is terminated. If $P_6$ for year $N$ is positive, the program returns to Section 2 to calculate pilot requirements for year $N-1$, and continues through Section 3 to process new pilots and cross-training requirements for that year. After the final year has been processed, the program proceeds to Section 4.

The desk job inventory accumulation is illustrated in Fig. 17.

**Section 4: Computation of Commission Training Entrainants and Graduates**

After the pilot requirements for all years, weapon systems and pilot types have been processed, the number of UPT graduates $P_{12}$ in each year is known. Using the value of $P_{12}$ in each year, the program
Fig. 14—Flowchart of the process of cross-training pilots in similar aircraft
Fig. 15—Flowchart of the process of cross-training pilots in dissimilar aircraft
Fig. 15—Flowchart of the process of cross-training pilots from desk jobs.
Fig. 17—Flowchart of the process of updating the desk job inventory
schedules people through commission training and into UPT in the following manner:

Given year N as the end year of UPT, successive computations are made (going back in time) of the beginning year of UPT (I1), the end year of commission training (I2), the beginning year of the AF Academy (I3A), the beginning year of ROTC (I3B), and the beginning year of OTS (I3C). The number of pilot trainees entering UPT in year I1 from the AF Academy (A16), from ROTC (A17), and from active duty (A18 and A19) is then totalled. This total is reduced by deducting the number of UPT attritions in year N and the result is compared with the number of required UPT graduates P12 in year N. If the computed number of UPT graduates is less than the number required, the deficit is filled by scheduling more people into UPT from OTS in year N. If the number of pilot candidates in UPT exceeds the number required to graduate, the number of people coming from ROTC is diminished proportionately. (If ROTC output goes negative, a message stating this fact is printed.)

If it is assumed that the number of UPT entrants from each UPT source has been adjusted to match the UPT graduation requirement, the required numbers of people are scheduled to enter the AF Academy, ROTC, and OTS in years I3A, I3B, and I3C, respectively.

Figure 18 illustrates the commission training scheduling procedure.

C
A detailed description, with flowcharts and listing, of the computer program for a pilot flow simulation. Given the number of trained pilots required over a time period, and a statement of the policy concerning the flow of pilots between desk and flying assignments, the computer program determines at what times and in what numbers pilots must enter and leave training courses. Requirements for a maximum of 20 years, 80 weapon systems, and 3 pilot types can be processed. PILOT can estimate the effects of alternative policies on pilot flows, and the effect of these flows on training rates. Combined with cost and resource models of the training activities, it may be used to estimate the overall impact on costs of pilot training alternatives.
