Tracor Marine
### Under Contract Number, N00600 85 D 0834, delivery order 010, Tracor Marine furnished and installed a new gantry crane and power pack for the OCP SEACON. The crane and power pack were manufactured by Allied Systems Company (ASC), Marine Crane Division, Portland, Oregon, under Tracor Marine purchase (Cont')
orders 72420 and 72498, respectively. The orders were placed on 1 November 1985 and 4 December 1985 for the crane and power pack. The power pack was delivered to Tracor Marine by 28 February 1986. The crane was shipped from ASC on 20 March on two separate trucks, arriving at Fort Lauderdale on 24 and 25 March. The crane is designated ASC Model TB90-65 and carries serial number 1636. The system was installed aboard SEACON at the Tracor Marine Shipyard during the period 24 March through 1 April 1986 and accepted by CHESNAVFACENGCOM on 3 April 1986.

As part of the acceptance procedure, factory and post-installation field tests of the system were conducted in accordance with Tracor Marine specification 85 723605 5 and test criteria established on scene. The purpose of this report is present the results of the factory and field acceptance tests and to document any discrepancies.

1.0 INTRODUCTION
Under Contract Number, N00600-85-D-0834, delivery order 010, Tracor Marine furnished and installed a new gantry crane and power pack for the OCP SEACON. The crane and power pack were manufactured by Allied Systems Company (ASC), Marine Crane Division, Portland, Oregon, under Tracor Marine purchase orders 72420 and 72498, respectively. The orders were placed on 1 November 1985 and 4 December 1985 for the crane and power pack. The power pack was delivered to Tracor Marine by 28 February 1986. The crane was shipped from ASC on 20 March on two separate trucks, arriving at Fort Lauderdale on 24 and 25 March. The crane is designated ASC Model TB90-65 and carries serial number 1636. The system was installed aboard SEACON at the Tracor Marine shipyard during the period 24 March through 1 April 1986 and accepted by CHESNAVFACENGCOM on 3 April 1986.

As part of the acceptance procedure, factory and post-installation field tests of the system were conducted in accordance with Tracor Marine specification 85-723605-5 and test criteria established on scene. The purpose of this report is to present the results of the factory (Section 2.0) and field (Section 3.0) acceptance tests and to document any discrepancies (Section 4.0).

2.0 FACTORY TESTS
Factory tests were conducted at the ASC Marine Crane Division facilities on 12 through 15 March 1986. The crane was mounted on a test stand. Test weights were provided by ASC. The tests were witnessed by the following personnel:

C.H. Sayler        ASC
J.D. Ghegan        ABS
J.N. Smith         CHESNAVFACENGCOM
W.L. Lane          Tracor Marine
The results of the factory tests are provided in Appendix A. No deficiencies were observed in the factory tests, although several tests were not conducted that were required to ascertain compliance with the specification; those tests were subsequently conducted during the field tests.

3.0 FIELD TESTS

The field tests were conducted immediately after installation of the system aboard SEACON during the period 2 to 3 April 1986. Certified concrete weights were used. Witnessing the tests were the following personnel:

C. Risener  
J. Moore  
H. Ackerman  
L. Ryder  
W. Lane

Tracor Marine
Tracor Marine
Tracor Marine

The results of the field tests are provided in Appendix B.

4.0 DISCREPANCIES

The Allied Marine Crane met or exceeded all the acceptance test criteria with the following exceptions:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Test Performance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Noise Level 85dBA (Section 3.5.4.1)</td>
<td>87-92 dBA</td>
</tr>
<tr>
<td>Minimum Hook Speed Under Rated Load of 30 fpm (Section 3.2.2)</td>
<td>20 fpm</td>
</tr>
</tbody>
</table>

In addition, several other operational characteristics were noted. These include:

1. Noticeable vibration throughout the dock and simultaneous "groaning" when buffing with the rated load (44,000 pounds); and
2. A significant drop in engine rpm when a heavy lift was initiated. At the rated load, the rpm's dropped from 1800 to 1500. At the proof load (54,000 pounds), the rpm's dropped to 1100.

Mr. Richard Brecko of ASC indicated on 11 April 1986 that the first problem is common for a finely machined hydraulic ram and expects the vibration and noise to dissipate as the system is broken in. Further investigation is required into the second problem; ASC has agreed to look into the situation.

Also noted during the test period is a misalignment of the welded house break fixture on the pedestal relative to the mating lock on the rotating superstructure by 1° or so when the crane is in a fore and aft position, or at right angles to the outerline of the access hole (and the gantry). To make the house brake serviceable when securing the boom in the boom crutches, the fixture on the pedestal needs to be shifted approximately 5/8 inch. This can be accomplished by cutting off the horizontal plate (several inches away from the rotating components) offsetting it, and rewelding it, effectively lining up the holes to accept the locking bar.

5.0 CONCLUSION

The Allied Marine Crane installed aboard SEACON meets the procurement specifications with only minor exceptions, none of which materially degrade performance. Several other operational and installation problems were noted during the test period and action is being taken to resolve them.
APPENDIX A

Results of Factory Tests
MODEL: TB 90-65  SERIAL NO.: 1636  BY (Initial): CHS  DATE: 3-14-86

INIT/DATE

APPENDIX B

Results of Field Tests
1.0 INITIAL PREPARATIONS

After reassembly and installation of crane by shipyard, the Allied factory representative shall determine that all components are correctly hooked up and functioning correctly. This shall include, but not be limited to, engine performance, hydraulic pumps, and hose connections to matching control circuits. When the crane is fully checked out including filling the hydraulic reservoir, fuel tank and radiator, testing shall commence.

2.0 NO LOAD OPERATION TEST

The crane shall be required to function through full operating ranges in all directions specified for the equipment. During the test, operation of the limit switches, emergency stops and limit device recovery features shall be demonstrated.

2.1 Luffing Operation

2.1.1 Set engine speed at 1800 RPM.

4 cycles - Raise boom from 0° to maximum 25.37 SEC (AVG)
Lower boom from maximum to 0° 47.16 SEC (AVG)
1 cycle - Vary the luffing speed during cycle so that the boom slows to about 20% of speed before hitting stops on raised and lowered positions.

2.2 Winching Operation

2.2.1 Raise boom to 80° and extend boom to 65 feet.

3 cycles - Raise and lower hook block through full range of travel at speeds varying from 0 to maximum (high speed setting). Demonstrate anti-two-block operation.

2.2.2 Lower boom to 45° angle, fully extended. Measure distance from anti-two-block weight to deck surface. 44.33 FT.

2 cycles - High speed winch setting,

(75 FPM) Time raising 35.46 SEC (AVG)
(76.1 FPM) Time lowering 34.94 SEC (AVG)

2 cycles - Low speed winch setting,

(38.76 FPM) Time raising 69.15 SEC (AVG)
(40.12 FPM) Time lowering 66.30 SEC (AVG)

1 cycle - Lower boom to 0° and swing boom to starboard quarter. Pass block to forklift on dock. Veer winch wire while forklift is carrying block until approximately 3 wraps of wire are left on winch drum. Check that the "down stop" mechanism shuts off winch. Stop forklift travel at same time.

OK 1/4/2
2.3 **Rotation**

Raise boom to 45°, fully extended

3 cycles - Rotate through 360° at varying speeds from zero to maximum (clockwise)

3 cycles - Repeat operation in counter clockwise direction.

(1.08 RPM) 2 cycles - At full speed, rotate CW 360° **55.60 SEC(AVG)**

(1.05 RPM) 2 Cycles - At full speed, rotate CCW 360° **57.12 SEC(AVG)**

2.4 **Boom Extend**

Raise boom to maximum angle.

3 cycles - Time to extend, maximum speed **56.81 SEC(AVG)**

Time to retract maximum speed **56.67 SEC(AVG)**

2 cycles - Vary speeds from maximum to zero for each direction.

2.5 **Emergency Stop**

Demonstrate emergency engine shutdown by depressing emergency shutdown button, after reducing engine speed to 1000 rpm.

Diagnosed accomplishes fully as required

2.6 **Verification of Auxiliary Items**

2.6.1 1. Defrost Fan
2. Window Wiper
3. Smoke Alarm
4. Test Button
5. Dimmer, Panel
6. Cab Light (120 V) to be changed to 12 VDC
7. Horn (120 V) TO BE CHANGED TO 12 VDC
8. Heater/Air Conditioner
9. Power Pack Gages
10. Tach Gage (Accuracy) AS NOT COMPLAINT
11. Power Pack Light
12. Cab Outlet (120 VAC) NOT HOOKED UP

2.6.2 Krueger System
1. Anti-2-Block, Winch FAILED ONE HOIST TEST
2. Anti-2-Block, Extension
3. Angle Indicator Set ± 2°
4. Length Indicator Set ± 1 Ft.
5. Load-Moment Indicator is Operational
6. Winch Down Stop PULLED WIRE AND DRUM WITH ACRE

2.7 Simultaneous Operation
Show the following in both directions:
1. Swing & Boom
2. Swing & Extend
3. Swing & Winch
4. Boom & Extend
5. Boom & Winch
6. Extend & Winch

2.8 Noise Test
Set engine speed at 1800 RPM.

Measure noise level inside the cab, with the door closed and floor plates in place, and panels set in place on the power pack. Set instrument at operator's head level 97-92 DBA

Instrument Used REALISTIC - 332050 RADIO SACK
LOAD TEST

3.1 Proof Load Test ABS Approval
This test shall conform to ABS requirements per "Certification of Construction and Survey of Cargo Gear on Merchant Vessels", ABS-1975.

The proof load shall be 5 tons in excess of working load; or

44000 pounds SWL + 10000 pounds = 54000 pounds

Subject to the approval of the local surveyor the tests shall be conducted as follows:

3.1.1 Boom Horizontal - Maximum Radius

1. With the boom horizontal, and the boom extension retracted, lower the hook block and secure to the test load.

2. Hoist the load clear of all obstructions and rotate crane clockwise one revolution at 1/3 speed.

3. Rotate crane one revolution counter clockwise at 1/3 speed.

3.1.2 Boom Elevated - Minimum Radius

1. Raise boom (extension still retracted) to angle of 59 degrees with load on hook.

2. Lower load to deck (distance from crane centerline is 25 feet) and release hook.
3. Raise boom to 70° angle and extend boom to full length of 65 feet.

4. Lower hook block and engage hook with test load.

5. Hoist the load clear of all obstructions and rotate crane clockwise one revolution at 1/3 speed.

6. Rotate crane one revolution counter clockwise at 1/3 speed.

7. Lower test load to deck.

PROOF TEST OF CRANE: THE TEST OF STATICALLY HOLDING A LOAD AT 5 TON (10,000) LBS. ABOVE THE RATED LOAD (PER ABS).

3.2 Rated Load Test

3.2.1 Sequential Operation

1. **Adjust test load to 44,000 pounds.**

2. **Lower boom to 3° elevation with boom retracted.**

3. **Secure hook block to test load.**

4. **Raise 44000 pound test load with luffing cylinders to 70°.**

5. **Bring test load to cab level with winch.**

6. **Rotate crane clockwise 180°. Swing back 180°.**
   Note: Load must clear all obstruction while swinging.

7. **Extend boom to 65 feet.**

8. **Luff boom to 84°.**

9. **Lower boom to 70°**

10. **Retract boom extension fully in.**

11. **Winch load up to within 15 feet of sheave case.**

12. **Lower boom to 3°.**

*NOTE: RAISED TEST LOAD WITH LOW SPEED WINCH SETTING THROUGH DISTANCE OF 20 FEET IN 60 SECONDS*

*RATE OF TRAVEL = \( \frac{20 \times 60}{60} = 20 \text{ FPM} \)*

(3 blocks of content)
Repeat Steps 4 through 13 for 5 cycles.

3.2.2 Lateral Load
Shift ballast and list ship 5° to starboard. With the boom horizontal and the boom extension fully retracted secure the hook to the load on the deck.

Hoist the load high enough to clear all obstructions and rotate clockwise, stopping momentarily when the boom is over the starboard beam. Resume clockwise, turn 90° stopping when boom is fore and aft to demonstrate brake holding and start up. Continue clockwise 180° to original position and lower load to deck.

**Note:** This test deleted per Harry Ackerman (Ches Div) - 4/3/86 due to dockside obstructions / ongoing activities.

3.3 Gantry Travel
Mark off 60 feet along the track, allowing 10 feet or more on each end for slowing and accelerating the gantry.

Lower boom to 3° with the extension fully retracted.

Secure hook to test load of 44,000 pounds.

Position boom so as to clear all obstacles on deck when gantry is in extreme positions, both fore and aft.

Set independent power pack for 1800 rpm.
Move control stick to full speed, bring gantry up to speed and time the speed between the marks.

\[(40.8 \text{ FPM}) \times 2 \text{ cycles} - \text{ Time to move gantry aft} \quad 73.5 \text{ SEC(AVG)}\]

\[\text{(38.4 \text{ FPM})} \times 2 \text{ cycles} - \text{ Time to move gantry fwd} \quad 78 \text{ SEC(AVG)}\]

2 cycles - Vary speeds from maximum to zero for each direction.

3.1 Proof Load Test ABS Approval

This test shall conform to ABS requirements per "Certification of Construction and Survey of Cargo Gear on Merchant Vessels", ABS-1975.

The proof load shall be 5 tons in excess of working load; or

44000 pounds SWL + 10000 pounds = 54000 pounds

Subject to the approval of the local surveyor the tests shall be conducted as follows:

3.1.1 Boom Horizontal - Maximum Radius

1. With the boom horizontal, and the boom extension retracted, lower the hook block and secure to the test load.

2. Hoist the load clear of all obstructions and rotate crane clockwise one revolution at 1/3 speed.

3. Rotate crane one revolution counter clockwise at 1/3 speed.

3.1.2 Boom Elevated - Minimum Radius

1. Raise boom (extension still retracted) to angle of 59 degrees with load on hook.

2. Lower load to deck (distance from crane centerline is 25 feet) and release hook.
3. Raise boom to 70° angle and extend boom to full length of 65 feet.

4. Lower hook block and engage hook with test load.

5. Hoist the load clear of all obstructions and rotate crane clockwise one revolution at 1/3 speed.

6. Rotate crane one revolution counter clockwise at 1/3 speed.

7. Lower test load to deck.

WITNESS, ASC ____________________  ABS OBSERVER ____________________

PROOF TEST OF CRANE: THE TEST OF STATICALLY HOLDING A LOAD AT 5 TON (10,000) LBS. ABOVE THE RATED LOAD (PER ABS).

3.2 Rated Load Test

3.2.1 Sequential Operation

1. ✓ Adjust test load to 44,000 pounds.

2. ✓ Lower boom to 3° elevation with boom retracted.

3. ✓ Secure hook block to test load.

4. ✓ Raise 44,000 pound test load with luffing cylinders to 70°.

5. ✓ Bring test load to cab level with winch.

6. ✓ Rotate crane clockwise 180°. Swing back 180°. Note: Load must clear all obstruction while swinging.

7. ✓ Extend boom to 65 feet.

8. ✓ Luff boom to 84°. 75° load would strike now at 84°.

9. ✓ Lower boom to 70°

10. ✓ Retract boom extension fully in.

11. ✓ Winch load up to within 15 feet of sheave case.

12. ✓ Lower boom to 3°. (Over Quay Wall)

Note: Raised test load with low speed winch setting through distance of 20 feet in 60 seconds.
Rate of travel: \[ \text{rate of travel} = \frac{20 \times 60}{60} = 20 \text{ FPM} \]
Repeat Steps 4 through 13 for 5 cycles.

3.2.2 Lateral Load

Shift ballast and list ship 5° to starboard. With the boom horizontal and the boom extension fully retracted secure the hook to the load on the deck.

Hoist the load high enough to clear all obstructions and rotate clockwise, stopping momentarily when the boom is over the starboard beam. Resume clockwise, turn 90° stopping when boom is fore and aft to demonstrate brake holding and start up. Continue clockwise 180° to original position and lower load to deck.

**NOTE: THIS TEST DELETED PER HARRY ACKERMANN (CHS DIV) - 4/3/86 DUE TO DOCKSIDE OBSTRUCTIONS & OUTGOING ACTIVITIES.**

3.3 Gantry Travel

Mark off 60 feet along the track, allowing 10 feet or more on each end for slowing and accelerating the gantry.

Lower boom to 3° with the extension fully retracted.

Secure hook to test load of 44,000 pounds.

Position boom so as to clear all obstacles on deck when gantry is in extreme positions, both fore and aft.

Set independent power pack for 1800 rpm.
Move control stick to full speed, bring gantry up to speed and time the speed between the marks.

(40.8 FPM) 2 cycles - Time to move gantry aft 73.5 SEC(AVG)
(38.4 FPM) Time to move gantry fwd 78 SEC(AVG)

2 cycles - Vary speeds from maximum to zero for each direction.
