DESIGN AND IMPLEMENTATION OF A PERSONNEL DATABASE SYSTEM FOR INDONESIAN NAVAL OFFICERS (U) NAVAL POSTGRADUATE SCHOOL MONTEREY CA D M ARIVADI JUN 86

UNCLASSIFIED
DESIGN AND IMPLEMENTATION OF A PERSONNEL DATABASE SYSTEM FOR INDONESIAN NAVAL OFFICERS

by

Djoko M. Ariyadi

June 1986

Thesis Advisor: Daniel R. Dalk

Approved for public release; distribution is unlimited.
**Title:** Design and Implementation of a Personnel Database System for Indonesian Naval Officers

**Authors:** Djoko M. Ariyadi

**Type of Report:** Masters Thesis

**Date of Report:** June 20 1986

**Abstract:**

The objective of this thesis is to provide a software tool to support the Deputy Chief of Staff for Personnel and Staff Function of the Indonesian Navy in making decisions with fast, timely, relevant, up-to-date and accurate information regarding Personnel Management activities. A database design is proposed including the logical and physical phases and an implementation of a personnel database prototype is undertaken on a microcomputer using dBASE II.
Design and Implementation of a Personnel Database System for Indonesian NavalOfficers

Dean of Information and Policy Sciences
ABSTRACT

The objective of this thesis is to provide a software tool to support the Deputy Chief of Staff for Personnel and Staff Function of the Indonesian Navy in making decisions with fast, timely, relevant, up-to-date and accurate information regarding Personnel Management activities.

A database design is proposed including the logical and physical phases and an implementation of a personnel database prototype is undertaken on a microcomputer using dBase II.

ACKNOWLEDGMENTS

I would like to acknowledge the help of those who made this thesis possible. First, of course there are Professor Daniel Roy Dolk and Professor Richard Allin McGonigal, both of whom showed great understanding during the time that it took to finish the thesis. I am also very grateful to Captain Frederick W. Weber, Jr., US Army and Lieutenant Mark L. Scire, US Coast Guard assisting in the editing of this thesis.
I. INTRODUCTION

The most important resource in any organization is its personnel. All aspects of an organization are dependent on personnel, so a large measure of the success of an organization depends on properly managing its human resources. This makes personnel management a critical task.

Decisions which affect personnel must be carefully planned. Personnel are human beings, unlike other resources such as materiel or money. Materiel may be moved about without the same considerations involved with moving people. Materiel does not need a life-cycle management system as complex as personnel management.

The personnel administration cycle consists of procurement, classification, education, utilization, treatment, and separation [Ref. 1]. Each phase must be carefully planned and followed by a decision that requires information support. The information support must be accurate, timely and relevant.

Human memory is limited and does not always process information fast enough. A computer can aid the human mind because it has the capability to process large amounts of data with high accuracy and little error.

In light of the needs and capabilities described above, this thesis will discuss personnel management base on
database management using microcomputers as decentralized activities. This thesis will investigate the use of a microcomputer for processing personnel management data. It will show how a decentralized database system can provide information to assist a Deputy of Personnel and Staff Function in decision making regarding personnel management activities.

This system, which keeps track of an officer's career (job placement, promotion, education, training, etc), provides current information regarding an officer's career and shows what kind of jobs or education/training should be scheduled for a certain officer to gain required knowledge and experience before being assigned a specific job.

A reorganization of the Indonesian Navy was applied at the end of 1985. Because of the restructuring and insufficient information about the existing personnel system, this thesis presents only a prototype for implementation.

Chapter II discusses the Indonesian Navy personnel function activities and crucial problem in the present system, which the prototype is designed to address.

Chapter III reviews the database development process, which includes: the general system analysis and design, the database system concept and the advantages and disadvantages of using it, and introduction to database design (both
logical and physical), with special emphasis on relational database design which focuses on the relational forms and the characteristics of relational databases.

Chapter IV describes the implementation of this personnel database system for Indonesian Naval Officers, particularly the Officer Career System.

Finally, chapter V presents the conclusion that database processing applied to the Indonesian Naval Officer Career System, can increase decision making ease, timeliness, confidence, and reliability.

Programs using dBase II are provided so the user can easily interact with the computer to get information about the officer career field. These programs are shown in Appendix D.
II. BACKGROUND

A. INTRODUCTION

The Indonesian Navy has many subsystems, one of which is the Navy Personnel System. The Navy Personnel System is concerned with personnel resource utilization, and management of other resources to make the Indonesian Navy organizationally effective and efficient in supporting national defense and security.

B. PERSONNEL MANAGEMENT FUNCTION

The Indonesian Navy personnel system has two main functions; Manpower Management and Personnel Administration.

1. Manpower Management

In general the main functions of Manpower Management are: To investigate activities and to determine personnel requirements including qualification, quality and quantity for supporting the Indonesian Navy’s main tasks.

2. Personnel Administration

Personnel activities have the following life-cycle functions: Procurement, Classification, Education and Training, Utilization, Treatment and Separation.

   a. Procurement

   Personnel procurement is the process of acquiring new personnel from national human resources according to Indonesian Navy Organization requirements.
b. Classification

Personnel classification is the process of analyzing and classifying individuals by job/occupation, so that individual requirements and organizational requirements are in balance.

c. Education and Training

Personnel education and training are the processes and activities which impact knowledge for personnel development related to assignments and promotions.

d. Utilization

Personnel utilization is the process and activity of selecting the right people for promotion and job/assignment. By placing the right person in the right place, the personnel assignment system facilitates maximum exposure and chances for individual promotion. Maximum exposure and promotion support future personnel assignments.

e. Treatment

Personnel treatment is a complex field, and is not an easy job. Activities in this category include salary, allowance (wife, children), morale, leave, recreation, rewards or awards, medical, insurance, etc.

f. Separation

Personnel separation is the process and activity of keeping a satisfactory balance within the organization while dealing with personnel retirement. Personnel retirement occurs:
- When manpower control and composition needs in the organization result in personnel separation (reductions in force).

- Because of normal retirement.

C. PERSONNEL SYSTEM REQUIREMENT

Information to support decisions by the Deputy of Personnel must be relevant, timely and correct.

The organization must maintain many files in the personnel system such as payroll, separation, reward, classification, education and occupation. In a file processing environment, these result in a high degree of data redundancy and are difficult to maintain and update. For example, after a promotion all files related to rank must be changed. Similarly, for personnel career planning, all education data, occupation data, and rank data must be provided on the same report.

It is not easy to retrieve information from different files in a short time, and it is inefficient to support these kinds of information needs using file systems. In order to avoid duplication, and to facilitate fast retrieval, a relational database system may be a desirable alternative.

Using a relational database system allows an organization's data to be processed as integrated files. It reduces artificially imposed constraints caused by separate applications and permits the Deputy of Personnel and his staff to access data more naturally.
D. THE CRUCIAL PROBLEM IN THE PRESENT SYSTEM

Personnel Administration cycles like training, career planning, promotions, job placement and separation pose many administrative problems. Training must have standardization grades, personal records for each trainee, personal biography etc. It is difficult to maintain and retrieve such data accurately and quickly.

The Navy Officer promotion system recognizes two periods in a year, April and October. So much data must be collected for supporting the candidate's promotion that it is difficult to retrieve data from the source. Sometimes human errors occur or too much data is collected.

When career planning is done by hand, the same problems recur because one must collect and gather data from a filing cabinet and then match it with each person and job.

When updating data related to promotion, a new job or new education it is difficult to manipulate data manually. When calculating a pension for example, it is difficult to provide information quickly because the birth date must be subtracted from the current year by manual methods. When the executive or the Chief of Staff needs adhoc information from the Deputy of Personnel, manual systems cannot provide results quickly, thus he cannot make the decision with confidence.
E. CAREER MANAGEMENT CONTROL

Three main activities occur in career control: promotion, education/training and job placement. Each closely supports the others.

1. Promotion

As mentioned earlier, the regular officer promotion system recognizes two periods in a year, April and October. Three or four months before, the candidates are proposed from naval stations/bases such as West Fleet, Marine Corps and other Main Commands. Much data must be collected to support the candidate’s promotions, such as conduct, previous jobs, rank history, education and training history, and other administrative information.

Sometimes this information appears with manual typing error or incorrect information because of human errors, and much time is lost correcting it.

After collecting this information, the career control staff can examine and clarify which officers are eligible for promotion. Education, job placement and date of rank determine eligibility. The staff then matches this data with data from the personnel data bank. This procedure, if done by manual methods as is currently the case, is very time consuming and requires much staff and clerical support.

2. Educational

The educational system and its administration is a bit different from the promotion system. Information about
education comes from centralized activities, but the same administrative process occurs as with the promotion system.

An example is the military education level from general development, for example the Second Officer Continuing Education corresponding to the US Army Officer Advanced Course. By collecting and gathering the data from filing cabinets, the career control staff can clarify and examine which officers are eligible to attend this course. After that they send a message/telegram to the Main Commands or Naval Stations. Main Commands then respond concerning the officer’s eligibility for this course by sending a message back to Deputy for Personnel. Again the career control staff handles this information from all the Main Commands and Fleets. A lot of time is spent in clerical tasks, and even more staff is needed to handle educational activities.

3. Job placement

For regular job placement the peak load activities happen as the officer nears the end or finishes a course. After examining the officer’s previous job experiences and educational background, the career control staff examines alternatives and decides where the officer would best serve in a new job. Again, if it is done by manual methods, sometimes information is incorrect and it is time consuming to correct. Just as with the promotion and educational systems, the officer data are kept in filing cabinets.
III. DATABASE DEVELOPMENT PROCESS

A. SYSTEMS DEVELOPMENT

The software engineering field is interesting and challenging because it requires the combination of both science and art. Software is an intangible thing, so it is more difficult to measure, evaluate and estimate than other engineering products.

1. The Roles of Systems Analyst

The Systems Analyst is known by various names such as Systems Engineer, Systems Designer, or Programmer Analyst. Currently System Analysts are usually located in or near the computer functions in an organization. It is most common to find them in a project development department which reports to the director of the information system, although Systems Analysis and Design are sometimes decentralized into the functional areas that process information.

A Systems Analyst tries to trace the current systems /manual systems and uses various means of information gathering techniques, such as interviews, questionnaires, observation, and document examination. He must try to choose the techniques that best fit the situation of the user organization. He also must evaluate this information
in order to recognize the problem and provide alternative solutions (Figure 3.1).

**Figure 3.1** Tasks of Systems Analyst.

2. **Software Life Cycle**

The software engineering process is very complex. If software engineering is not provided with comprehensive and integrated tools, techniques and disciplines that support all activities of the development life cycle, productivity and quality can not be expected to realize substantial gains. The software life cycle may be fundamentally partitioned into the development phase and the operations and maintenance phase. There are many interpretations of the various development phases of software, but the important thing to remember is that the larger the project, the more detailed the engineering design phase must be. One methodology for software life cycle is the Waterfall model. [Ref. 2], is illustrated in
The original version was presented in Royce, 1970 and was foreshadowed in various U.S Air Force and industry publications such as Air Force, 1966 and Rosove, 1967.

Figure 3.2 Waterfall model.
As seen above, each phase culminates in a verification and validation activity. By verification and validation one can eliminate as many problems as possible in the results of that phase. So each product phase is the basis for the next product phase.

a. System Feasibility

System feasibility must consistently, comprehensively and accurately represent the user requirements. System feasibility is determining its life cycle feasibility and superiority to alternate concepts. The model of the system at the system feasibility level must support analysis and validation of the required operational capability as well as understanding the user and the developer.

b. Software Plan and Requirements

This phase determines the required functions, interfaces, and performance for the software product. Another activity is supporting the analysis of all subsystems from the system viewpoint such as communications and peripheral devices. The objective of this phase is to provide requirements for each of the subsystems. This involves trade-off studies of the overall system model to arrive at a complementary set of requirements for each subsystem that will, when integrated, collectively provide the behavior identified in the software plan and requirements.
c. **Product Design**

In this phase we consider the primary deliverable for software design. The design specification is a document with verified specification of the overall hardware/software architecture, control structure and data structure for the product. The design specification serves dual roles by providing a guide to software implementation (coding) and testing, and assisting the maintainer after software has been released. The specification can undergo considerable change during the software life cycle, therefore it is essential to review the design documentation at each step in the development phase. This phase can also provide a user manual’s draft and test plan if necessary.

d. **Detailed Design**

With the use of a design representation that may be graphical, textual or tabular a detailed procedural specification for the software is created. Like a blueprint, the detailed design specification should provide sufficient information for someone other than the designer to develop the resultant source code.

e. **Coding**

The final objective of software engineering is to translate representations of software into a form that can be understood by the computer. In this phase the
activity is a process that transforms a design into a programming language, such as Pascal, Cobol, Fortran, or dBase II.

i. Integration

After each program component is tested individually, the next step is integration testing. The program components are put together and the application is tested in its entirety.

g. Implementation

In this phase the software product is fully operational on the hardware system.

h. Maintenance

Maintenance is critical in the database environment because changes to a data element can affect several application programs. During the use of a large program errors will occur which must be corrected.

There are many activities during maintenance such as:

1. Correction because of one or more coding errors.

2. Correction because of changing environment (new generation of hardware system, new operating system, new software version etc).

3. Correction to improve the software even though it may not have any errors.

B. DATABASE SYSTEM CONCEPT

Demands on data processing professionals to improve the effectiveness and efficiency of their organizations have
caused them to turn to database technology. Unfortunately many organizations are switching to a database approach with little or no understanding of the concept.

Database systems in general stress controlled data redundancy, faster processing time, higher reliability, reduced storage requirements, program independence from changes in the storage structure, control of data administration, and a better definition of data. A database system is powerful, but to achieve these goals is not a simple matter.

1. Data as a Resource

Data has no value if it cannot be processed or retrieved in a timely and accurate manner. With the growth of computer capability in terms of more speed and memory, we can now process information rapidly and consistently.

Using file system applications, data is usually associated with a single functional application program. For example, personnel data is associated with a personnel department program, logistics data is with a logistic department program, and payroll with a accounting department program. Some items might be stored in more than one functional area. For example, name and rank might be stored in the personnel department, accounting department and logistic department. Once the data itself is modified or changed, all the functional areas must change that data.
This is not efficient. As a result we get redundant and inconsistent data that increases the possibility of errors.

When using a database, the data must be commonly defined and consistently organized. Data must be organized so that they can be used by the entire system. Any update in one area must update all of the database records relating to this data regardless of where they are stored. This approach reduces and controls duplicate data storage and also makes integrated processing possible.

2. Database Management System

Database has been defined in many ways in the literature. Kroenke's definition [Ref. 3] is that a database is a collection of files and relationships among records in those files. Actually a database is more than a collection of files; it is a collection of integrated files.

A database management system (DBMS) is an integrated software package that allows users to define the structure of the database, access the database and administer the database. One or more languages is provided to accomplish these tasks.

The data manipulation language (DML) is a language used to access the data in the database; a DML is used to perform insertions, deletions, changes, and retrievals. Also DML can be defined as an extension to a host programming language, such as COBOL, FORTRAN and query language (QL). The data definition language (DDL) is used
to define the logical structure of the database and can be used to specify data items and their interrelationships.

The primary advantage of using a DBMS is that it provides data independence which means the database user does not need to be familiar with implementation details. Changes can be made to the data or to the schema with little impact on application programs using that data.

A second advantage is that it provides an integrated package of tools for handling data with greater standardization and control.

However, a general purpose DBMS might not be as efficient for a specific application as specialized software.

3. Database Administration

A database design project must have its own centralized administration. The systems development manager, therefore, must ensure that controls for the systems development project are not neglected.

Because of the shared nature of the data resource in the database approach, a centralized function is required to manage and protect it. Access to this data must be controlled. No function can be allowed to modify the data without the permission of the individual who is responsible for that. The Database Administrator is responsible to maintain access and security for all of the data.
Database Administration is a very complex job because the information which the user needs is varied and wide-ranging. Thus the Database Administrator must deal with providing the requested information. Issues to be considered include:

a. Whether different functional areas need to share the database.
b. Whether all levels of management (upper, middle, lower) need the information and how to structure the database to solve this problem.
c. The database structure which must be implemented to provide information in an accurate, relevant, and timely manner. The more information we need, the more data structure must be designed.

4. Advantages and disadvantages of using a database

File systems and database system each have their own advantages and disadvantages (Ref. 3: pp. 3-7).

a. Advantage of Using a Database:

1. Enables more information to be produced from a given amount of data.

2. Elimination of duplication saves file space, and to some extent, can reduce processing requirements. The most serious problem of data duplication is that it can lead to a lack of data integrity. A common result of a lack of data integrity is conflicting reports. Perhaps nothing is more aggravating to management or more embarrassing to the data processing staff than to be confronted with computer reports that disagree.

3. Creation of program / data independence. Data independence means that when the data structure changes, application programs keep running without being changed.

When data are centralized in a database,
one department can specialize in the maintenance of data. That department can specify data standards and ensure that all data adhere to the standards. When someone has a data requirement, he or she can contact one department instead of many file maintenance groups.

5. Allows query language with easier programming and makes it easier to retrieve sophisticated information in DBMS environment.

b. Disadvantages of using a database

1. Using a database can be expensive. The DBMS may occupy so much main memory that additional memory must be purchased. Conversion from existing systems can be costly, especially if new data must be acquired. Operating costs and overhead for some systems will be higher. For example, sequential processing of payroll will never be done as fast in the database environment.

2. Database processing tends to be complex. Large amounts of data can be interrelated in the database. This means more sophisticated programming, and of course highly qualified systems and programming personnel are required.

3. Backup and recovery are more difficult. Because of increased complexity and because databases are often processed by several users concurrently, backup and recovery are more difficult.

4. Security more difficult. Integration, and hence centralization, increase vulnerability to security problems because all data are centralized under one system.

C. DATABASE DESIGN

A database contains a diversity of related data so that typically the equivalent several files are used to hold the
data. Other files may be needed to hold descriptive information about the data and their relationships.

The analysis of databases concentrates on logical structures. The result of this analysis is a precise specification of the contents and required manipulations for the database.

An integrated collection of support programs and file structures to support a database, its logical requirements, and an interface to user program is called a database management system. For that reason alone, the design of a database will be the most important component affecting how well a system will work.

The design of a database describes how the data in the system is divided into the different files or records.

Database design basically has three steps:

- Decide what data should be stored.
- For the logical database design, identifying data entities, attributes, and relationships.
- For the physical database, it means physical storage of data on storage devices and the resultant performance of the database design.

1. **What Data Should be Stored**

   If the system is at all complex, the designer needs to consider what kind of data should be stored. First he must look at the output or proposed output. Before the required output can be displayed on a screen or printed on a report, the data must be in the database somewhere. For example, if the system must print personnel addresses, it
will need the name, street, city, zip code and so on. Or, if the system needs to know how old personnel were when they retired, the designer must store data from which age may be calculated (for example, birth date and the retirement year).

Most of the data entered will appear immediately on the output reports, but not always. The user may decide that a piece of data is not being used now, but might be needed in the future. The solution in such a case should be to enter it now. This may cause a little more data entry, but it is easier to have data entered as it is captured, rather than later when it may not be available.

2. Logical Database Design

A database contains many types of data items. These data items have to be associated into a database structure. A systems analyst tends to group together in records collections of data items which data processing views as being useful. The logical database structure is the foundation on which most future data processing will be built. Future organizations will be managed with database resources, networks to access the databases, and end-user software for employing and updating the data.

The logical design begins with an investigation of user requirements and ends with a logical description of a database that can support those requirements. Logical
description such as data models present logical views of real entities and their relationships. An entity may be a tangible object such as a person. It may be intangible such as a job title. Entities have properties, called attributes, which associate a particular value from a domain of attribute values with each entity. Examples of attributes are color or name. Usually the domain for an attribute will be a set of integers, real numbers, or strings. An entity usually has a data item that uniquely identifies it.

For example, employee number is the unique identifier of the employee entity. Figure 3.3 is a sample of entities and attributes. Shown below the serial number is a unique key. Entity sets can be represented by a labeled box, see figure 3.4. Data models describes entity sets, entities, attributes and their relationships. Relationships among them are addressed by the relational model. Examples are relationships between college, departments, professors, and courses.

<table>
<thead>
<tr>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serial #</td>
</tr>
<tr>
<td>001234</td>
</tr>
<tr>
<td>002134</td>
</tr>
<tr>
<td>006789</td>
</tr>
</tbody>
</table>

Figure 3.3 Entity set example.
College, department, professor, and courses are identified as entity sets. Figure 3.5 shows the relationships between these entity sets. The relationship between college and its departments is called one-to-many, in that any one college may have many departments (Administrative, Computer, ORSA). The same relationship exists between departments and their courses.

Many-to-many is the relation between Professors and Courses: One professor can teach many courses, and one course can be taught by many professors.

![Diagram](image.png)

Figure 3.5 Relationship diagram.
3. Physical Database Design

The result of the physical database design is specification of the storage allocation parameters. Setting up the database on a real computer is called physical database design. In other words, the physical database is the component of the database that confirms the computerized version of the logical database.

The physical database consists of five components [Ref. 4: pp. 30-33]: storage structure, access strategy, data loading, data update, and data maintenance.

Knowledge of the storage structure is important because it indicates the power of the DBMS for certain applications. The storage structure is the physical architecture construction. Its consists of dictionary, indexes, relationships, data. The dictionary is the repository of the information represented by the compiled data definition language. Each DBMS's dictionary is unique.

For faster access, index mechanisms are needed. There are two kinds of indexes, primary and secondary. The primary indexes are unique value guaranteed and the secondary indexes are repeated values allowed.

The connections between record occurrences are called relationships. There are two kinds of relationships, static and dynamic.

The data part of the storage structure contains the occurrences of the records. Static DBMS have multiple record
type data storage structures. Dynamic DBMS have a separate
data storage structure for each record type.

An access strategy is a collection of routines that
insert data into and retrieve data from the database.
Understanding access strategy is basic to knowing why
certain operations take longer than others.

Data loading is the process of inserting large
quantities of data into the database at one time. Some DBMS
allow or require data to be loaded in certain ways to
achieve efficiencies during subsequent updating and
reporting.

The updating process attempts to ensures current
data. Critical in the updating application is how well the
DBMS handles additions of new records, modification of,
element values, modifications of relationship occurrences
and deletions of existing records.

The most important requirement for database
maintenance is the creation of a backup copy of a database.
While creating a backup is certainly the first step in
backup-and-recovery, the nature of the backup process needs
to be understood so that sufficient resources can be
allocated to its accomplishment.

D. RELATIONAL DATABASE DESIGN

In a filing system, each functional area has its own
files and procedures. Because of this there is a complex
flow of paperwork between the functional areas. In this
case data for different areas are separately maintained in separate files. It is hard to manage this data. Accuracy is lost, and maintenance and change are difficult to accomplish.

But when data are designed into an integrated database system, the data structures become more complex but the data flows are simplified. The data are consistent and accurate.

Changes in procedures can be made rapidly. Fundamentally different analysis and design techniques are needed.

1. **Relational normal forms**

   When modification of data has unexpected consequences, it is referred to as a modification anomaly. A deletion anomaly exists if the deletion of one entity deletes facts about a second entity. An insertion anomaly exists if an insertion of a fact about one entity cannot be made until a fact about a second entity is known. Anomalies can be removed or eliminated through normalization, but this normalization process can create an interrelation constraint.

2. **Normal Forms**

   All relations are by definition in first normal form. When there are no repeating groups the relation is in first normal form. See figure 3.6
A relation is in second normal form if all nonkey attributes are dependent upon all of the key attributes. No attribute is dependent upon only part of the key. The second normal form is illustrated in Figure 3.7.

**UNNORMALIZED RECORD:**

<table>
<thead>
<tr>
<th>ORDER#</th>
<th>ORDER_DATE</th>
<th>CUSTOMER#</th>
<th>CUSTOMER_NAME</th>
<th>CUSTOMER_ADDRESS</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>PRODUCT#</th>
<th>PRODUCT_NAME</th>
<th>QUANTITY</th>
<th>PRODUCT_ORDERED_PRICE</th>
<th>TOTAL_PRICE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**FIRST NORMAL FORM:** Remove the repeating group.

<table>
<thead>
<tr>
<th>ORDER#</th>
<th>ORDER_DATE</th>
<th>CUSTOMER#</th>
<th>CUSTOMER_NAME</th>
<th>CUSTOMER_ADDRESS</th>
<th>ORDER#</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>PRODUCT#</th>
<th>PRODUCT_NAME</th>
<th>QUANTITY</th>
<th>PRODUCT_ORDERED_PRICE</th>
<th>TOTAL_PRICE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(Reprinted from [Ref. 5: p. 180])

**Figure 3.6** From unnormalized to first normal form.

When relations are in second normal form, they may have transitive dependencies. These dependencies are removed by placing the relation in third normal form.

A relation is in third normal form if it is in second normal form and has no transitive dependencies. All attributes must depend upon all of the key, and dependencies are not transferred from one attribute to another. Third normal form is illustrated in figure 3.8.
SECOND NORMAL FORM: Remove attributes not dependent on the whole of a (concatenated) primary key as in the ORDER PRODUCT record above.

ORDER ORDER- DATE CUSTOMER CUSTOMER CUSTOMER ORDER TOTAL

Order-Product

ORDER PRODUCT QUANTITY PRODUCT TOTAL

Product

PRODUCT PRODUCT- NAME PRODUCT PRICE

3. Relational Database Design Criteria

The first design criterion is elimination of modification anomalies. If relations cannot be put into normal form, then modification anomalies do not happen. Relations that are in normal form are preferred, and normal form is a design objective.

Relation independence is the second design criterion. Two relations are independent if a modification can be made to one relation without affecting the other relation. Relation dependence is sometimes caused by normalization to remove modification anomalies. This effect causes a conflict in design criteria.

The third criterion is ease of use. The design should structure relations so that they are familiar and natural to the users.
IV. DATABASE IMPLEMENTATION

A. INTRODUCTION

The main purpose of this chapter is to design a database system which may be used by the Indonesian Navy Deputy of Personnel to make more effective decisions.

Personnel management was previously defined as those managerial activities that deal with procurement, development, maintenance, utilization and separation. This is also known as the personnel management cycle. For supporting these activities, data must be accurate and timely. All of the personnel activities are controlled by the Deputy of Personnel. These include education, training, promotion, and job evaluation.

The computer can help support the Deputy of Personnel with various decision making processes because of its speed and accuracy in processing large amounts of data.

An organization can more easily decentralize its operations when it uses interactive processing. This adds a new dimension to the Personnel Management Information System by allowing easy editing and filing of existing and new data.

After careful analysis, it was decided that the functional requirement described in Chapter II suggested the application of a relational database. This justification was
based not only upon various possible record relationships, but also the frequency and volume of the expected transactions. Promotions occur regularly twice a year. Officers are selected for promotion based on requirements because of job vacancies particularly for the colonel and flag officer. For this purpose the system should be designed with a query capability.

For example the amount of officer records is around 8000, with five to seven percent eligible for promotion, and because of limited vacancies only two or three percent actually are promoted accepted.

The same thing occurs in educational and job placement. Comparing the officers' chances for various schools, the most significant hurdle is from Second Officer Educational level to Command and Staff College Level. This happens once a fiscal year and is usually followed by job placement. This kind of job placement is predictable, so it can be prepared as the officer nears the end or finishes a course. But managers still need some queries to handle this problem, because there are many irregular job placements because of job requirements from outside the Navy organization, for example D O D. The system should be able to provide relevant information immediately to support fast decision making by the Director of Personnel or Staff to fill those job vacancies.
The above is based on career applications only. Besides this, there are other applications such as rewards and pension. Again, the system should eventually be able to handle all personnel officer activities.

B. RELATIONAL DATABASE DESIGN AND APPLICATION

There are many ways in which a database can be designed. This design will describe a design theory and application for the Indonesian Naval Officer Personnel System, particularly the career system, where education, rank and job evaluation are involved.

The most important phase in the design of a database is in the relational database design, where the record relationship and record structure will be developed.

1. Record Relationship

Relationships can be specified in a variety of ways. One technique is called a Bachman diagram or structure diagram. See figure 4.1.

![Bachman Diagram](attachment:image.png)

Figure 4.1 Bachman diagram
The above diagram shows the relationships among records. The single and double arrow notation is used to express relationships among records. There are four different relationships, one-to-one, one-to-many, many-to-one, and many-to-many relationships.

Examples as follows:

a. One-to-one.
   An officer can only have one set of body characteristics and vice versa.
   OFFICER -----> BODYCHAR.

b. One-to-many.
   One officer may have attended several military schools.
   OFFICER -----> MILEDU.

c. Many-to-one.
   Many different jobs in job records history will have been performed by one officer.
   JOBOFF ----> OFFICER.

d. Many-to-many.
   An officer can be eligible for many jobs or vice versa.
   OFFICER ----> JOBLIST.

2. Record Structure

Record structure shows the relationships among attributes, where the key attribute is underlined and uniquely identifies each record. For many-to-many relationships between records, another record is needed, called an intersection record. This record is a device for integrating two or more files, and the keys of the files being integrated must appear in the intersection record.

Examples of record structure as follows:
1. Personal identification
   OFFICER (SERNO, NAME, CORPS, RANKID, EDUID, SEX,
   BIRTHDD, BIRTHMM, BIRTHYY, BIRTHP, RELIGION)

2. Body characteristic
   BODYCHAR (SERNO, WEIGHT, HEIGHT, SKCOLOR, HRTYPE,
   EYECOLOR, BLOOD, SHOE, HAT, UNIFORM)

3. Rank (intersection)
   RANK (SERNO, RANKID, RANKDD, RANKMM, RANKYY,
   RORNO, RDATORNO)

4. Military education (intersection)
   MILEDU (SERNO, MEDURANK, MEDLEVEL, MEDUID,
   MDEDST, MMEDST, MYYEDST, MMDEDED, MMMEDED, MYYEDED, MMEDUR, MDEDURSLT)

5. General education (intersection)
   CIVEDU (SERNO, CEDURANK, CEDLEVEL, CEDUID,
   CDEDST, CMEDST, CYYEDST, CDDDEDED, CMDEDED, CYYEDED, CEDUDUR, CEDURSLT)

6. Occupation (intersection)
   JOBOFF (SERNO, JOBID, JOBRANK, JOBDD, JOBM, JOBYY, JOBECH, JORNO, JDATORNO)

7. Occupation list
   JOBLIST (JOBID, JOBDES, ECHELON, JOBSTAT)

8. Rank requirement for occupation (intersection).
   JOBRNK (JOBID, JOBRK)

9. Corps requirement for occupation (intersection).
   JOBCORP (JOBID, JOBCO)

10. Military education requirement for occupation
    (intersection). JOBEDU (JOBID, JOBED)

11. Military education list
    MEDULIST (MEDUID, MEDUDES)

12. General education list
    CEDULIST (CEDUID, CEDUDES)

13. Rank list
    RANKLIST (RANKID, RANKDES, RKECHREQ)

C. INTERRELATIONAL CONSTRAINTS

As Kroenke says [Ref. 3: pp. 286, 305], not all relational database designs are equal; some are better
than others. The important point is, a design that meets the user’s needs is better than one that does not.

When a relation is normalized, this often may eliminate modification anomalies at the expense of creating interrelational constraints. The elimination of anomalies may, however, have a disadvantage as well. Everytime a record is split into two or more relations an interrelational constraint is created. The initial job relation had modification anomalies because it was not in 2nd normal form. We eliminated these anomalies by splitting the relation into the "JOBOFF" and "JOBLIST" relations.

The interrelation constraints occur, because two relations share the attribute "JOBID". However, a "JOBID" may not exist in "JOBOFF" if it is not in "JOBLIST".

We can say that the values of "JOBID" in "JOBOFF" must be a subset of the values on "JOBID" in "JOBLIST". See figure 4.2.

![Figure 4.2 Example of JOB relational.](image)

D. THE DESIGN APPROACH

The design of this system was approached by considering the output required and anticipating the questions and
queries that management might ask. Output would be provided in both screen and printed form.

The following are examples of some queries and output form:

1. Query rank.
   a. Gives the information about all of officers in a certain rank, screen or printer.
   b. List an officer’s promotion history by entering his serial number, screen or printer.

2. Query education.
   a. Gives the information about all officers who have a military education level (e.g. Command and Staff College level), screen or printer.
   b. Gives the information about all officer who have a specified military education (e.g. Navy Command and Staff College), screen or printer.

3. Query job.
   a. List all officers eligible for a certain job, screen or printer.
   b. List all jobs which an officer may be eligible for, screen or printer.

4. Print personnel.
   a. Gives all information about all of the officers list by by name (screen or printer).
   b. Gives all information about all of the officers listed by serial number (screen or printer).

Based upon the estimated outputs, the next step was to define what kind of data was required to support these outputs and what kind of record structure should be included into the dBase II database. (See data dictionary Appendix B.)
E. SYSTEM CONSTRAINTS

The system has certain hardware and software constraints. These constraints are:

1. This system must use DOS operating system version 2.0 or higher.

2. This system uses dBase II database management program.

3. This system runs on IBM PC or compatible only.

4. The widths of the output are less than 80 columns.

5. In order to make additions, changes and deletions, the users must be familiar with the design of the system and know about this data structure.

F. SYSTEM EXPANDABILITY

By the design of its data structure, this system can be expanded. Some of the possible expansions are:

1. The system can be expanded by creating and adding data files such as:
   a. Personal identification data structure (birth date, birth place).
   b. Personal characteristics (weight, height, hair color, eye color, etc).
   c. Family data (spouse, children, address, sex, birth date, and birth place).
   d. Payroll (main salary, wife allowance, children allowance, and deductions).
   e. Uniform sizes and other possible personal data.

2. By adding the above to the data structure, the output can be easily expanded to include:
   a. Output reports for payroll.
   b. Output reports for personal characteristics.
c. Output reports for occupation.
d. Output reports for families, etc.

3. Updating modules for the addition of data files as described above.

G. HIERARCHY CHART OF THE SYSTEM

The diagram below (figure 4.3) is the hierarchy chart of the system, where each block/module has a specific function, such as adding or updating a record. Each module has submodules with similar functions but different tasks, such as officer record addition, job record addition, etc.

![Hierarchy chart of the system]

Figure 4.3 Hierarchy chart of the system.
H. IMPLEMENTATION

As mentioned before, the design of this system was approached by considering and anticipating the questions and queries that management might ask. The following are examples of queries relating to educational and job information.

1. Educational Information

After successfully "booting" the system and reaching the main menu by following the instructions in the user manual (Appendix A), the user can choose one of the main menu selections (figure 4.4).

<table>
<thead>
<tr>
<th>OFFICER</th>
<th>MAIN-MENU</th>
<th>MAY 1986</th>
</tr>
</thead>
<tbody>
<tr>
<td>A --- &gt; ADD RECORD</td>
<td></td>
<td></td>
</tr>
<tr>
<td>D --- &gt; DELETE RECORD</td>
<td></td>
<td></td>
</tr>
<tr>
<td>C --- &gt; CHANGE RECORD</td>
<td></td>
<td></td>
</tr>
<tr>
<td>P --- &gt; PRINT</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Q --- &gt; QUERY INFORMATION</td>
<td></td>
<td></td>
</tr>
<tr>
<td>R --- &gt; RETURN TO DATABASE</td>
<td></td>
<td></td>
</tr>
<tr>
<td>S --- &gt; RETURN TO DOS</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

SELECT AN ACTION BY LETTER ----> ; ;

---

Figure 4.4 Main menu selections.
Selecting the <Q> option from the menu result in a query menu selection (see Figure 4.5) and again the user chooses one of them. For selecting <A> will provide the military education level for an officer. The next screen show the list of military education level and the corresponding code (see Figure 4.6).

**QUERY MENU**

---

**QUERY OPTIONS**

A ----> PROVIDE MIL. EDUCATION LEVEL INFORMATION
B ----> PROVIDE ANY MIL. EDUCATION INFORMATION
C ----> PROVIDE RANK HISTORY INFORMATION
D ----> PROVIDE JOB HISTORY INFORMATION
E ----> PROVIDE JOB ELIGIBLE INFORMATION
F ----> PROVIDE OFFICER ELIGIBLE INFORMATION

TYPE RETURN KEY, RETURN TO MENU

---

SELECT AN ACTION BY LETTER ----> :

---

Figure 4.5 Query Menu Selection.
MIL. EDUCATION # DESCRIPTION
11 NATIONAL DEFENSE
12 JOINT COMMAND & STAFF COLLEGE
13 COMMAND AND STAFF COLLEGE
14 STAFF COLLEGE
15 2nd OFF. CONTINUING EDUCATION
16 1st OFF. CONTINUING EDUCATION
17 NAVAL ACADEMY
18 BASIC OFFICER SCHOOL
19 CANDIDATE OFFICER SCHOOL

PLEASE SELECT ONE DESIRED MIL. EDUCATION NUMBER, ACCORDING TO THE ABOVE LIST (2 DIGITS PLEASE) e.g. "15" AND HIT "RETURN" KEY.

TO FINISH (RETURN TO QUERY MENU OPTION) HIT 'RETURN'

ENTER MIL. EDUCATION NUMBER (2 DIGITS): 

Figure 4.6 Example of Menu for Military Education Level.

By typing <13> in response to the menu in Figure 4.6 (code for Command and Staff College level), a list of officers currently attending the Command and Staff College including serial number, name, corps and the year end’s attended (see Figure 4.7) will be displayed. Before the list appears on the screen, the system asks if the user wants the display on the screen or in hardcopy form.
EQUIVALENT WITH THE LEVEL OF 2nd OFF. CONTINUING EDUCATION

<table>
<thead>
<tr>
<th>NAME</th>
<th>RANK</th>
<th>SCHOOL</th>
<th>YEAR-END</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUDIYONO</td>
<td>LIEUTENANT COLONEL</td>
<td>2nd OFF. CONTINUING EDU.</td>
<td>1983</td>
</tr>
<tr>
<td>MARTIN</td>
<td>LIEUTENANT COLONEL</td>
<td>A.G ADVANCE</td>
<td>1983</td>
</tr>
<tr>
<td>SUWITO</td>
<td>LIEUTENANT COLONEL</td>
<td>INFANTRY ADVANCE</td>
<td>1983</td>
</tr>
<tr>
<td>SULIS</td>
<td>MAJOR</td>
<td>INFANTRY ADVANCE</td>
<td>1983</td>
</tr>
</tbody>
</table>

Figure 4.7 Example of Officers Attending Military Edu. Level

2. **Job Information**

The procedure to retrieve educational information is similar. The job information system tries to match the desires of an officer concerning eligible jobs placement and conversely a certain job for which many officers are eligible. In this prototype system a simple example is given to show a personnel officer trying to match an officer with a job description.

Each job needs eligible officers to fill it. In a simple case the basic prerequisites for job placement are rank, education and corps. Secondary considerations include other adjustment and past performance.

Given a job description and prerequisites, this prototype can help the user to match a certain job with the officers eligible by reason of rank, education, and corps consideration. Exact job descriptions and eligibility requirements are beyond the scope of this thesis. We are only suggesting how this system might expedite the job placement matching process.
After initial screening it is a simple matter for the system to output an officer's promotion history and job history to make complete information available. An example follows:

Start with the main menu and respond with the appropriate query selection; then choose or type <E> for jobs eligible for an officer (see Figure 4.8). By giving the input officer's serial number, the screen will appear with two selections: job available for the same rank, or after promotion (see Figure 4.9). After typing <s> the system responds by asking if the user needs the list on the screen or hardcopy. By typing <h> the computer gives all information on job placement after promotion correlated by rank, education, and corps (see Figure 4.10).

Figure 4.8 Menu for Job Selection.
JOB AVAILABLE FOR THE SAME RANK or AFTER PROMOTION?
ENTER 's' FOR SAME RANK or 'p' PROMOTION

<td>JAKARTA</td>
</tr>
<tr>
<td>012</td>
<td>INSTRUCTOR</td>
<td>NAVAL ACADEMY</td>
<td>SURABAYA</td>
</tr>
</tbody>
</table>

Figure 4.10 Example of jobs placement for an officer.

Conversely, given a job-id, the system will respond with all eligible officers with the same consideration given to education, rank and corps.

3. Special Job Discussion

The system described above is just a prototype, and further special work is needed. Job placement is a critical task because many factors must be considered, such as education, rank and corps.

If possible, the needs of the organization should be synchronized with the individual’s needs and desires, in order to make the officers more satisfied with their jobs/tasks.

There is a further requirement for definitions of job descriptions and eligibility requirements. This is
not an easy task because there are hundreds of jobs which must be carefully analyzed. More research is needed to accomplish this task before the system can be expanded.

Because of the very complex consideration involved in personnel management, this system remains just a tool to get more reliable, up to date and timely information to the user.
V. CONCLUSION AND RECOMMENDATION

The Naval Officers Personnel System is very complex. Managing it manually demands great effort, is time consuming, requires a large staff to manage the personnel function, and is neither effective nor efficient in supporting decision making processes. Database processing can increase decision making productivity and provide relevant, accurate, and timely information.

This thesis has focused on a proposed Personnel Database System for Indonesian Naval Officers. However this system can be used for other personnel applications with a little modification. The developed sample database presented here is based on relational normal form. Normal forms can be applied to decrease inefficiency of the relational database model in the system design process, and also to decrease data redundancy.

A sample implementation using dBase II is provided in Appendix A, showing user interaction with the computer without necessarily knowing programming or database system management.

With the latest microcomputer performance and capabilities in networking, this system could be put on staff personnel desks and connected to each other in one headquarters building via a distributed network system.
without requiring more space or restructuring office setting.

A complete implementation of the system needs more data about job descriptions and prerequisites regarding education, rank, corps, sex and other considerations. Finally the system must evolve through continued use and feedback from personnel management users.
APPENDIX A
USER MANUAL

1. PURPOSE

The purpose of this manual is to describe how to run the system.

2. OBJECTIVES

This system was designed to be user friendly, expandable and maintainable.

3. CONFIGURATION OF THE SYSTEM

To run this system the following is necessary:

a. IBM PC or compatible.

b. IBM printer or compatible.

c. 2 disk drives

d. dBASE II diskette.

e. dBASE II Project diskette.

4. RECORD STRUCTURE.

There are nine record types and fifteen table codes within this system. The records and table codes are:

a. Officer identification record (OFFICER.DBF)

b. Rank record (RANK.DBF)

c. Military education record (MILEDU.DBF)

d. General education record (CIVEDU.DBF)

e. Occupation record (JOBOFF.DBF)

56
f. Occupation list (JOBLIST.DBF)
g. Body characteristic record (BODYCHAR.DBF)
h. Corps code table (CORPCODE.DBF)
i. Rank list (RANKLIST.DBF)
j. Military education list (MEDULIST.DBF)
k. General education list (CEDULIST.DBF)
l. Sex code table (SEXCODE.DBF)
m. Religion code table (RELIGION.DBF)
n. City code table (CITYCODE.DBF)
o. Education result table (RESULT.DBF)
p. Skin color table (COLORSK.DBF)
q. Hair color table (TYPEHR.DBF)
r. Eye color table (COLOREYE.DBF)
s. Blood table (BLOOD.DBF)
t. Uniform size table (UNIFORM.DBF)
u. Echelon code table (ECHELON.DBF)
v. Rank requirement for occupation (JOBRNK.DBF)
w. Education requirement for occupation (JOBEDU.DBF)
x. Corps requirement for occupation (JOBCORP.DBF)

For a more detailed description of the data records and tables, see Appendixes B.

5. RUNNING THE SYSTEM

a. Turn on the following devices, in order:

1. IBM PC/compatible system unit (switch on the right side).

2. The monitor (switch located on the front side).
3. The printer (Okidata, switch located on the right side).

b. Insert Operating system diskette into drive A, and the system into drive B.

c. Wait for the system to boot up, answer the prompts by entering date and time or just hit <Enter> twice.

d. When the screen format appears type <B: > to move drive B.

e. Now type <dbase pers>

f. When the system asks "enter your password please", simply type <pers>; If you fail in this section because you type the wrong password (unauthorized access), then type <do pers>.

g. Now you are in the OFFICER system which displays the main menu. The main menu will give you the choice of the following options:

   A ---> ADD RECORD
   D ---> DELETE RECORD
   C ---> CHANGE RECORD
   P ---> PRINT
   G ---> QUERY INFORMATION
   R ---> RETURN TO DATABASE
   S ---> RETURN TO DOS

Once you are at the main menu level, just type the desired option (A, D, C, P, G, R, S).
APPENDIX B
DATA DICTIONARY

This data dictionary contains data elements of the database of the personnel system. There are 5 columns in the table:

1. Data item. This column contains the data item as it is known to the user.

2. Acronym. This column contains the unique name for the data item that will be used by programmers/analysts.

3. Type. This column contains the data item's type. "N" means numeric and "C" means character (alphabetic).

4. Length. This column contains the number of characters used in each data item.

5. Description. This column contains the description of the data item.
